The position of benevolent despot has obvious drawbacks. In Mr Rhodes's case the dependence which the populations of Cape Colony were led to place on him had its reaction on the public in a demoralizing loss of self-reliance, and for himself it must be admitted that the effect on the character of a man already much disposed to habits of absolutism in thought and action was the reverse of beneficial. Mr Rhodes felt himself to be far stronger than any man in his own surroundings; he knew himself to be actuated by disinterested motives in the aims which he most earnestly desired to reach. Of this, when his life is viewed as a whole, there can be no reasonable doubt. He was profoundly impressed by a sense of the shortness of life, and he so far abused his power as to become intolerant of any sort of control or opposition. In the conception of his great schemes he frequently erred in detail, but he had not the patience to accept correction. Neither could he make allowance for candid difference of opinion. The man who thought with him was his friend, and was accepted as such; the man who differed from him was an antagonist, and either to be overridden or pushed aside. The inevitable result followed, that though Mr Rhodes did much of great and good work during the six years of his supreme power, he entirely failed during that period to surround himself, as he might have done, by a circle of able men fit to comprehend and to carry on the work to which his own best efforts were directed. To work with him was practically impossible for those who were not willing to accept without demur the yoke of dogmatic authority; and the methods which he employed were at times so crude as to alienate not only men naturally opposed to his political ideals, but some of the best minds working in the interests of Empire for aims not unlike his own. He had a few devoted personal friends, who appreciated his aims and were inspired by his example; but he was lacking in regard for individuals, and a great part of his daily life was spent in the company of satellites and instruments, whom he used with cynical unconcern for the furtherance of his ends. That the ends were generous and impersonal redeems, but cannot be held to justify, an insensitiveness to some of the finer elements of human intercourse which limited the range of his character and led him into his gravest errors.

In 1896 the brilliant period of his premiership was brought to an end by the incident which became famous under the name of the Jameson Raid. The circumstances which led to the Raid belong properly to the history of the Transvaal. It is enough to say briefly here that the large alien population which had been attracted to the Transvaal by the phenomenal wealth of the Johannesburg gold-fields, conceiving themselves to have reason to revolt against the authority of the Transvaal Government, resolved towards the end of 1895 to have recourse to arms in order to obtain certain reforms. Arming was to take place secretly, and the revolution was to be carried out when the mining population was sufficiently prepared to be in a position to take concerted action. Mr Rhodes, as a large mine-owner, was theoretically a member of the mining population. In this capacity he was asked to give his countenance to the movement; and in so far as his extensive property in the Transvaal suffered from conditions which other mine-owners pronounced to be intolerable, he had the same right as others to decide by what means it was advisable to endeavour to obtain redress. But as prime minister of a British colony he was evidently placed in a false position from the moment in which he became cognizant of a secret attempt to overturn a neighbouring Government by force of arms. He did more than become cognizant. The subsequent finding of a Cape committee, which he accepted as accurate, was to the effect that "in his capacity as controller of the three great joint-stock companies, the British South Africa Company, the De Beers Consolidated Mines, and the Gold Fields of South Africa, he directed and controlled the combination which rendered such a proceeding as the Jameson Raid possible." He gave money, arms, and influence to the movement; and as the time fixed for the outbreak of the revolution approached, he allowed Dr Jameson, who was then administrator of the British South Africa Company in Rhodesia, to move an armed force of some 500 men upon the frontier. Here Mr Rhodes's participation in the movement came to an end. It became abundantly clear from subsequent inquiry that he was not personally responsible for what followed. The intention had been that Dr Jameson, with the force under his orders, should assist the development of the revolution in the Transvaal, and hold himself ready to move across the frontier if required. Changes in the local situation in the

Transvaal gave promise of averting or postponing the open conflict, when unfortunately, by a series of misunderstandings, Dr Jameson, whose personal chivalry in the matter was not questioned, conceived it to be his duty to lead his force across the frontier and to deliver the first blow. The Transvaal military authorities, fully warned by secret information, had no difficulty in dealing with the incursion. The little force was surrounded and led ignominiously prisoners to Pretoria. A cipher correspondence, seized and published by the Boers, left the civilized world in no doubt as to Mr Rhodes's share in the previous preparation, and he was for a time believed to be responsible for the Raid itself. Subsequent inquiries held by committees of the Cape Parliament and of the British House of Commons acquitted him entirely of responsibility for Dr Jameson's final movement, but both committees found that he had acted in a manner which was inconsistent with his duty as prime minister of the Cape and managing director of the British South Africa Company .He himself practically acquiesced in this finding, though from a somewhat different point of view, blaming himself, not for having encouraged the revolution, but for having failed to hold the movement so completely in check as to have been able to prevent disaster. No one recognized more fully than himself the scope of the blunder which had been committed.

He displayed, in the circumstances, characteristic qualities of pluck and candour. He made no concealment of his own share in the catastrophe; he took full responsibility for what had been done in his name by subordinates, and he accepted all the consequences which ensued. He resigned his premiership of the Cape; and recognizing that his presence was no longer useful in the colony, he turned his attention to Rhodesia. His design was to live in that country, and to give all the stimulus of his own presence and encouragement to the development of its resources. The Matabele rebellion of March 1896 intervened to prevent the immediate realization of his plans. In June Imperial troops were sent up, and by the end of July the result of the military operations had driven the natives to the Matoppo Hills, where they held a practically impregnable position. The prospect was of continued war, with a renewal of a costly campaign in the following year. Mr Rhodes conceived the idea that he might effect single-handed the pacification which military skill had failed to compel. To succeed, it was essential that he should trust and be trusted. He accordingly moved his tent away from the troops to the base of the Matoppo Hills. He lay there quietly for six weeks, in the power of the enemy, if they had chosen to attack. Word was circulated among the natives that he had come alone and undefended to hear their side of the case. A council was held by them in the very depths of the hills, where no armed force could touch them. He was invited to attend it. It was a case of staking his life on trust. He displayed no hesitation, but mounted and rode unarmed with the messenger. Three friends rode with him. The confidence was justified. They met the assembled chiefs at the place appointed. The native grievances were laid before Mr Rhodes. At the end of a long discussion Mr Rhodes, having made and exacted such concessions as he thought fit, asked the question, "Now, for the future is it peace or is it war?" And the chiefs laying down their sticks as a symbol of surrendered arms, declared, "We give you one word; it is peace." The scene, as described by one of the eye-witnesses, was very striking. Mr Rhodes, riding away, characterized it simply as "one of the scenes which make life worth living."

His life was drawing towards its end. He had still a few years, which he devoted with success to the development of the country which bore his name. The railway was brought to Bulawayo, and arrangements were made for carrying the line on in sections as far as the south end of Lake Tanganyika, a construction which was part of his pet scheme for connecting the Cape by a British line of communication with Cairo. He also concluded arrangements for carrying a telegraphic land line through to Egypt, and had the satisfaction of seeing the mineral development of the country fairly started. But the federal union of South Africa, to which he had always worked as the secure basis of the extension of British rule in the southern half of the continent, was not for him to see. The South African war broke out in 1899. Mr Rhodes took his part at Kimberley in sustaining the hardships of a siege; but his health was broken; and though he lived to see victory practically assured to British arms, peace had not been concluded when, on 26th March 1902, he died at Cape Town.

His life's work did not end actually with his death. He left behind him a will in which he dedicated his fortunes, as he had dedicated himself, exclusively to the public service. He left the bulk of his vast wealth for the purpose of founding scholarships at Oxford of the value each of £300 a year, to be held by students from every important British colony, and from every state and territory of the United States of America. The sum so bequeathed was very large; but it was not for the munificence of the legacy that the will was received with acclamation throughout the civilized world: it was for the striking manifestation of faith which it embodied in the principles that make for the enlightenment and peace and union of mankind, and for the fine constancy of Mr Rhodes's conviction that the unity of the British Empire, which he had been proud to serve, was among the greatest of organized forces uniting for universal good. The bequests to American scholars were made with the expression of a hope "that such an education will encourage and foster an appreciation of the advantages which I implicitly believe will result from the union of the English-speaking peoples throughout the world." Those to British colonists were for the purpose "of giving breadth to their views, for their instruction in life and manners, and for instilling into their minds the advantage to the Colonies, as to the United Kingdom, of the retention of the unity of the Empire." The will was drawn up some years before his death. A codicil, signed during the last days of his life, gave evidence of some enlargement of his views as to the association of races necessary in order to secure the peace of the world, and added to the original scheme a certain number of scholarships to be held at the disposal of German students.

The publication of the will silenced Mr Rhodes's detractors and converted many of his critics. It set a seal which could not be mistaken upon his completed life. The revulsion of sentiment towards him was complete, and his name passed at once in the public estimation to the place which it is probably destined to take in history, as one which his countrymen are proud to count among the great makers of the British Empire. (F. L. S.)

Rhodesia, North. See CENTRAL AFRICA, BRITISH; and conclusion of RHODESIA, SOUTH: *History*.

Rhodesia, South, comprising the whole of that section of British South Africa which stretches from the Limpopo northwards to the Zambezi, and from the Bechuanaland Protectorate eastwards to Portuguese East Africa. It thus includes the former native territories of Matabeleland and Mashonaland, which, with the circumjacent Banyai, Manica and Makalaka districts, have a total area of 175,000 square miles, with a population

estimated at 425,000, roughly distributed between the two main sections as under:—

	Area in Square Miles.	Population.
Matabeleland, with Makalaká, . .	61,000	155,000
Mashonaland, with Banyai and Manica,	114,000	270,000

But these divisions have now little more than a historical interest, and since 1894 the whole region forms a single political domain. It was administered by the British South Africa Company till 1898. In that year the Company was partly relieved of its strictly administrative functions by a resident commissioner appointed by the Secretary of State, and an executive council, consisting of the resident commissioner, the Company's administrators, and at least four others nominated by the Company, with the approval of the State Secretary. There is also a legislative council, including the senior administrator as president, the resident commissioner, five nominees of the Company approved by the State Secretary, and four members elected by the registered voters. To this council the president submits the yearly budget, which must be approved by the high commissioner, who has the direct control of the military police, and the final decision in all land disputes with the natives, mineral rights being reserved to the Company. There is a high court, with civil and criminal jurisdiction, besides district courts and a secretary for native affairs, with subordinate native commissioners, natives and non-natives all having equal rights, except in respect of arms and liquor.

Townships have been established at Salisbury (the capital), at Victoria, Umtali, Bulawayo, Gwelo, Enkeldoorn, and Melsetter. Others are being formed elsewhere, and the demand for building sites is increasing, especially at Salisbury and Bulawayo, where there are municipalities, Government offices, banks, churches, hotels, schools, public libraries, and hospitals. Another indication of progress is the extent of land already surveyed, which in 1900 exceeded ten million acres, distributed in about equal proportions over Matabeleland and Mashonaland. This almost sudden transition from the sheer savagery everywhere prevailing down to past the end of the third quarter of the 19th century to the establishment of European institutions, and the spread of civilizing influences amongst the rude aborigines, was primarily due to the introduction of law and order under a strong and just Government, but also to the fairly salubrious climate, the almost boundless agricultural and mineral resources of the land, and the rapid development of its communications. In 1899 nearly 3000 miles of roads and post routes had already been opened, besides 500 miles of cross-roads in the mining districts. In November 1897 the Rhodesian Railway, forming a continuation of the Cape trunk line to Vryburg, in Bechuanaland, had reached Bulawayo. Another section of 150 miles was completed by June 1900, and the system is to be continued for 300 miles northwards to the Zambezi through the valuable coal-fields, at least 400 square miles in extent, which were discovered in November 1900 some 180 miles north-west of Bulawayo. Provision has also been made for a branch from Bulawayo south to Gwanda (80 miles), to be ultimately connected through Tuli with the Transvaal system; while another branch is projected from Bulawayo north-east to Salisbury, the present inland terminus of the line running through Umtali and Portuguese territory to the coast at Beira (opened 1st May 1899).

In 1899 nearly 1,250,000 letters and packages were forwarded through the 55 post offices already opened; and in the same year the telegraph system comprised over 2500 miles of wires, with 75 offices, through which 86,000 messages were despatched. For the climate, physical features, and other geographical details, see SOUTH AFRICA, BRITISH. (A. H. K.)

History.—The first people to establish themselves in historic times in the territories now forming Rhodesia were the Matabele, a famous Bantu tribe and an offshoot of the Zulus. Moselekatze, their first chief, was a warrior and leader who served under the Zulu despot Chaka. Being condemned to death by Chaka, Moselekatze fled, with a large division of the Zulu army. About 1817 he settled in territories north of the Vaal, not far from the present site of Pretoria; and in 1836 his tribe had become so important that a treaty of friendship was entered into with him by the governor of Cape Colony. In the same year a large number of the "trek Boers" had settled north of the Vaal river, and came in contact with the Matabele, who attacked and defeated them, capturing a large number of Boer cattle and sheep. In November 1837 the Boers felt themselves strong enough again to assail Moselekatze, and they did so with such success that they drove him and his tribe north of the Limpopo, where they settled and occupied the country subsequently known as Matabeleland. In 1870 Moselekatze died, and was succeeded by his son Lobengula. In 1882 President Kruger, who was then bent on extending the boundaries of the Transvaal in every direction, endeavoured to make a treaty with Lobengula, but without success. The Warren expedition of 1884 to Bechuanaland, while it checked for a time the encroachments of the Transvaal Boers, and preserved to Great Britain the highway to the north through Bechuanaland, also served to encourage colonists to speculate as to the future of the interior.

Foiled in Bechuanaland, it soon became evident that the Boers were determined to get a footing in Mashonaland, and that the Portuguese and Germans were also anxious to get as much of the territory there as they could obtain. In 1887 Lord Salisbury had his attention called to the fact that the Portuguese Government had recently issued a map in which their territories were represented as extending over the greater portion of Mashonaland, and even Matabeleland. He thereupon protested that under the Berlin Act no claim to territory in Central Africa could be recognized unless it was supported by actual occupation, and he further said that the Zambezi should be regarded as the natural northern limit to the territories of Great Britain in South Africa. Meanwhile gold prospecting had been taken up actively all over South Africa, following on the discoveries at Barberton and the Rand; and at this time Lobengula was besieged for all sorts of concessions by both Portuguese and Boers, as well as by adventurers from various parts of the world. Mr Cecil Rhodes, who for a long time had kept his eyes on the great territories of the north, for the route to which he had striven so keenly in political circles in Cape Town, decided to make an effort to retain the country for Great Britain. With considerable difficulty he persuaded Sir Hercules Robinson, then high commissioner, to send Mr Moffat, the missionary, as an embassy to Lobengula, to endeavour to obtain an understanding with him. The result was a treaty under which Lobengula promised to enter into no correspondence or treaty with a foreign Power, nor to sell or otherwise dispose of any part of his territories, without the consent of the high commissioner. In October 1888 Mr C. D. Rudd, who for a long time had been associated with Mr Rhodes in mining operations, visited Lobengula at considerable personal risk, and succeeded in obtaining a concession of all the mining rights in the country from him. In consideration of this concession Mr Rudd (representing the Gold Fields of South Africa Company, and also a syndicate in which Mr Alfred Beit, Mr Rhodes, and Mr Rudd were the largest holders) promised Lobengula £100 a month, 1000 rifles, and a considerable amount of ammunition. At the same

time Lobengula was induced to issue a notice warning off all other concession-hunters. Mr Rhodes then applied to the Imperial Government for a Royal Charter with which to consolidate and develop the new territories and their mineral wealth. In applying for this charter the founders of the company stated their objects to be the following:—(1) To extend northwards the railway and telegraph systems in the direction of the Zambezi; (2) to encourage emigration and colonization; (3) to promote trade and commerce; (4) to develop and work minerals and other concessions under the management of one powerful organization, thereby obviating conflicts and complications between the various interests that had been acquired within these regions, and securing to the native chiefs and their subjects the rights reserved to them under the several concessions. In making this application the boundaries were purposely left somewhat vague. They were described to be the region of South Africa lying immediately to the north of British Bechuanaland, to the north and west of the South African Republic, to the west of the Portuguese dominions.

At the outset of the company's existence Mr Rhodes and his directors determined to effect the occupation of the country. A pioneer force was therefore sent in under Colonel Pennefather, consisting of 500 mounted police and a few hundred pioneers. Accompanying this force as guide was the accomplished traveller, well known throughout South Central Africa, Mr F. C. Selous. The work of transport was attended with considerable difficulty, and roads had to be cut as the expedition advanced. Nevertheless in a few months the expedition had reached the site of what is now the town of Salisbury, and had also established on the line of march small forts at Tuli, Victoria, and Charter. Mr Archibald Ross Colquhoun was the first administrator. He had not long been in office when, in May 1891, difficulties arose with the Portuguese on their north-west frontier, both parties claiming a certain tract of territory in which a Portuguese trading station had been established. The result was a skirmish, in which a small company of British South Africa Police were victorious. In 1891 Dr Leander Starr Jameson was appointed administrator in succession to Mr Colquhoun. The Boers for several years past had been planning a settlement in the territories north of the Limpopo, and they now determined, in spite of the Moffat treaty and the British occupation, to carry out their object. An expedition known as the Banyailand Trek was organized under the leadership of Colonel Ferreira, and two large parties of Boers proceeded to the banks of the Limpopo. Information of the intended trek had been conveyed to Cape Town, and Sir Henry Loch (the high commissioner) at once sent a strong protest to President Kruger, informing him that any attempt to invade the Chartered Company's territories would be an act of hostility against the British Crown; and Mr Kruger issued a proclamation forbidding the trekkers to proceed. Meanwhile, however, a party had already started and reached the Limpopo, where they were met by Dr Jameson in command of the British South Africa Company's forces. He told them that they would on no account be allowed to proceed except as private individuals, who might obtain farms on application to the Chartered Company. Colonel Ferreira was arrested and detained for a few days, and the expedition then broke up and dispersed.

The pioneers having been settled in Mashonaland, Mr Rhodes recognized the extreme importance of endeavouring to give the country a port nearer than that provided by Cape Town. He therefore made overtures to Portugal, and in 1891 a treaty was concluded between Great Britain and Portugal which provided that a railway might be constructed to Beira through Portuguese territory, on condition that Portugal should receive a duty not exceeding 3 per cent. on the value of the goods imported. The treaty further stipulated for the free navigation of the Zambezi and the construction of telegraphs. The boundaries of the Chartered Company's territories and those of the Portuguese were clearly defined. Prospecting operations were at once started, and various gold mines were discovered containing traces of old workings. Fresh gold reefs were also opened up. The prospects of the country seemed promising, and although a good deal of fever occurred in the low-lying valleys under the conditions of camp life, the health of the community soon improved as more suitable habitations were erected.

The first pioneers settled in Mashonaland. Ever since the advent of Moselekatze north of the Limpopo, the unfortunate Mashonas had been the prey of the Matabele; they therefore accepted British occupation gladly, recognizing that the British South African forces were likely to protect them against the raids of Lobengula and his warriors. The Matabele, on the other hand, were loth to abandon their predatory excursions among the Mashonas, and in July 1893 a large *impi* (native force) was sent into Mashonaland, and entered not only native kraals, but also the streets of the new township of Victoria. An attempt was made to preserve the peace, but it was evident from the attitude taken by the Matabele that nothing short of the authority which only superior force could command would settle the question. The Matabele were a proud and fearless race of warriors, who had never yet come in conflict with white men, and had never been defeated in their conflicts with native foes. It is true that under Moselekatze, a generation before, they had been driven out of the Transvaal by the Boers, but the *indunas* (petty chieftains) of 1890 were but children when this defeat had been inflicted upon them. Dr Jameson's forces were slender; and Mr Rhodes, on being consulted, urged him by telegram to "Read Luke fourteen, thirty-one." On obtaining a Bible, Dr Jameson read the words: "Or what king, going to make war against another king, sitteth not down first, and consulteth, whether he be able with ten thousand to meet him that cometh against him with twenty thousand?" He telegraphed in reply: "All right. I have read Luke fourteen, thirty-one." The position, though dangerous, admitted of no delay, and Dr Jameson determined to risk an expedition with the forces at his command. His success on this occasion doubtless weighed with him on another and less fortunate one. The force available consisted of about 700 volunteers and 225 British Bechuanaland police, with some 700 natives. Dr Jameson determined to march to Bulawayo, the headquarters of Lobengula and the capital of Matabeleland. The force was divided into two columns, and was to be met by a further column of natives marching from the south under Khama. The first engagement took place on the Shangani river, where the two columns which had started from Fort Charter and Fort Victoria were both engaged. Majors Forbes and Allan Wilson commanded in these engagements; and after a hot contest with between 4000 and 5000 Matabele, the latter were repulsed, machine guns being used with terrible effect upon the enemy. On 1st November a second fight occurred on the high ground, in which it was estimated that 7000 of the Matabele attacked the laager of the two columns. The oldest and most tried regiments of Lobengula dashed right up to the muzzles of the guns, but were swept down before the modern rifles and machine guns with which the invaders were armed. Meanwhile the column of Khama's men from the south had reached the Tati,

and won a victory on the Singuesi river on 2nd November. On 3rd November Bulawayo was reached, and the columns from Mashonaland, accompanied by Dr Jameson and Sir John Willoughby entered the town, Lobengula and his followers being in full flight. An endeavour was made to induce Lobengula to surrender; but as no replies were received to the messages, Major Forbes, on 13th November, organized a column and started in pursuit. The pursuing party were delayed with difficult roads and heavy rains, and did not come up with Lobengula until the 3rd December. Major Allan Wilson, in command of thirty-four troopers, crossed the Shangani river in advance, and bivouacked close to Lobengula's quarters. In the night the river rose, and reinforcements were unable to join him. During the early morning the Kaffres surrounded the little band, and after fighting most gallantly to the last, Major Allan Wilson and all his followers, with the exception of three messengers who had been sent back, were killed.

In January Lobengula died. His *indunas* submitted to the Chartered Company's forces, and the war, which cost the Chartered Company £100,000, was thus ended. Matabeleland was rapidly occupied by pioneers and others who went to join them. The climate was healthy, the altitude of the country being higher than that of Salisbury. Various gold reefs were discovered. A township was started and grew rapidly at Bulawayo.

In 1895 a question arose between the Chartered Company and the Imperial Government as to the annexation of the Bechuanaland Protectorate. An Annexation Bill had just been passed by the Cape Government, annexing British Bechuanaland proper to the Cape Colony. The British South Africa Company now put in a claim for the British Bechuanaland Protectorate, and provisional arrangements for the administration of these territories under their control were made (see BECHUANALAND). But the "Jameson Raid" interfered with their completion, and the whole constitution of the British South Africa Company was subsequently remodelled. In 1896 Mr Cecil Rhodes resigned his position as managing director of the British South Africa Company, and Mr Alfred Beit retired from the Board in London. While these changes in the directorate were going on, there occurred, in March 1896, a revolt of the Matabele, near Bulawayo. A general massacre of outlying settlers took place, and the whole country was in a state of rebellion. Imperial troops were hurried up to the assistance of such police as the British South Africa Company still had at its command. Volunteers were enrolled, and much fierce fighting followed. Early in October Mr Rhodes, who had just returned from London, went to Bulawayo. After conference with the military and other authorities in command on the spot, he determined to go, with Dr Hans Sauer and Mr Colenbrander, and interview the native chiefs. They went unarmed into the heart of the Matoppo hills, and there arranged terms of peace with the native *indunas.* The interview involved grave personal danger to the emissaries, and depended for its success entirely upon Mr Rhodes's personality and influence over the native races; but it terminated what promised to be a long and disastrous native war.

In 1897 a Select Committee appointed by the British House of Commons "to inquire into the origin and circumstances of the incursion into the South African Republic by an armed force, and into the administration of the British South Africa Company," held their sessions. Among the numerous witnesses called upon to give evidence were all the directors of the British South Africa Company, with the exception of Lord Grey. The Committee were unanimous in condemning the Jameson Raid, and in holding Mr Rhodes mainly responsible for the measures which led up to it.

In April 1898 the shareholders in the Chartered Company unanimously re-elected Mr Rhodes a director. Mr Alfred Beit was also proposed, but declined to accept the position. He was, however, reappointed in June 1902. As a result of the report of the British South Africa Select Committee, the whole future administration of Rhodesia was taken into consideration by the British Government (the armed forces of the Company had already been placed under the direct control of the Crown), and on 20th October 1898 an Order in Council was passed providing for the future regulation of the country. An Imperial resident commissioner was appointed, who was also to be *ex officio* a member of the executive and legislative Councils; and there was to be a legislative Council, consisting of five nominated and four elected members. These changes tended rather to increase the direct influence of the High Commissioner. It was also provided that this Order in Council, technically known as the Southern Rhodesia Order, might, if required, be extended to any other part of South Africa under British protection south of the Zambezi. The first meeting of the newly appointed Council took place at Salisbury on the 15th of May 1899.

In the earlier part of 1899 Mr Rhodes visited London and Berlin in connexion with the furtherance of his schemes for the Trans-Continental telegraph extension from Cape Town to Cairo, and the Trans-Continental Railway. He endeavoured while in London to obtain from the Government the guarantee of a loan for the purpose of extending the railway, to be raised at 3 per cent., but was unsuccessful. He received, however, the support of various companies in Rhodesia, who amongst them subscribed £252,800 at 3 per cent. for the immediate extension of the railway for 150 miles; and on 2nd May he stated, at a meeting of the Chartered Company, that the Rhodesia Railways Limited would raise another £3,000,000 at 4 per cent., to be guaranteed by the Chartered Company. In this way he hoped that the remaining 1050 miles of railway from Bulawayo to the frontier of German East Africa might be constructed. In Berlin Mr Rhodes had an interview with the German Emperor, when arrangements were arrived at with regard to the passage of telegraph lines over German territory. Mr Rhodes acted on behalf of the African Trans-Continental Telegraph Company, of which he was the promoter and principal director; and on their behalf he received from the German Government leave to construct a telegraph line across German East Africa, from south to north, at the cost of the Company, the work having to be completed within five years, from October 1899, the Company being called upon further to erect an additional line at its own cost between the two stations nearest to the German frontiers, from Rhodesia on the one side and British East Africa on the other, for the telegraphic traffic of German East Africa.

The early settlers of Rhodesia, for the first ten years of that country's existence, had a great deal to contend against. The political unrest of the country, the final breaking up of the Bantu power within its territories, the immense difficulties of transport, the Matabele rebellion, and a terrible cattle plague, known as rinderpest, all tended to keep back the country's progress. Nevertheless, the sturdy colonists settled there never lost heart, and persistently, as occasion offered, continued their development of the various gold properties which offered sufficient inducement to mining. The progress of the whole country, in spite of all drawbacks, has in many respects been remarkable. In no colony in South Africa, and probably in very few countries elsewhere in the world, has the extension of telegraphic communication and railways been so rapid and considerable in proportion to the population of the country. The telegraph line reached Salisbury in 1892, and at the end of 1899 a total of 3613 miles had been constructed. In addition to the telegraph lines, telephones have also been established

in many townships, and police posts in the country. Bulawayo is already a considerable town, with massive stone and brick buildings in the streets. The churches, hospitals, Stock Exchange, Government offices, banks, clubs, and hotels are equal to those of many of the older towns in South Africa. Both Salisbury and Bulawayo have municipalities; and municipal authorities are doing excellent work in the shape of road-making, lighting, tree-planting, &c., as well as in the laying out of public parks. The railway from Beira reached Salisbury in May 1899.

An efficient and mobile police force of a thousand Europeans, and three hundred native troops under Imperial officers, have their headquarters at Salisbury and Bulawayo, and detachments of these are placed at various outposts. In addition to gold, coal has been found in Rhodesia in various parts, of excellent quality and in considerable abundance. Good timber is found in the valleys, and excellent examples of locally made furniture and of wood for paving have already been sent to England. In some parts of the country have been found ancient ruins of extreme interest, especially those of Zimbabye, near Victoria. At these various ruins, implements and ornaments, some of them in gold and of great antiquity, have been discovered.

Northern Rhodesia is divided into two territories—North-Eastern and North-Western Rhodesia—and is administered by the British South Africa Company under the Orders in Council of 1899 and 1900. There is a separate administrator for each territory, the headquarters of the former administration being at Fort Jameson, and of the latter at Lealui. The country, although more tropical than Southern Rhodesia, is, for the greater part, a continuation of the high and healthy South African plateau, which extends from the Karroo in Cape Colony through Southern Rhodesia and north of the Zambezi. The territories are believed to be highly mineralized, and valuable deposits of copper have already been discovered, and are being developed. The African Trans-Continental Telegraph line has been constructed through North-Eastern Rhodesia, and the proposed Cape to Cairo Railway will, after leaving Victoria Falls on the Zambezi river, pass through North-Western and North-Eastern Rhodesia to the northern border at Lake Tanganyika.

Rhondda, an urban district and coal-mining locality of Glamorganshire, Wales, crossed by the river Rhondda, a right-bank tributary of the Taff, and separated on the east by the Rhondda-fach river from the parliamentary borough of Merthyr Tydfil. Population (1891), 88,351; (1901), 113,735.

Rhône, a department of south-eastern France, traversed by the Cevennes Mountains and watered by the Saône and by the Rhône, two rivers uniting at Lyons.

Area, 1104 square miles. The population, 741,470 in 1881, had increased to 835,157 in 1901. The births in 1899 were 15,998, of which 2143 were illegitimate; deaths, 17,662; marriages, 6236. There were in 1896, 1207 schools, with 91,000 pupils, not more than 1 per cent. of the population being illiterate. Out of 610,090 acres of land cultivated in 1896, 321,100 acres were plough-land and 74,100 acres vineyards. In 1899 the wheat harvest was valued at £536,000; rye, £84,000; oats, £104,000; potatoes, £296,000; vines, £1,120,000. The live stock in 1899 included 16,880 horses, 90,120 cattle, 38,100 sheep, 24,470 pigs, and 29,280 goats. Mining in 1898 yielded 32,400 metric tons of coal and 310,000 tons of copper, from the mines of Chessy. The metal industry turned out in 1898, 17,000 metric tons of cast-iron, 450 tons of iron, and 3100 tons of steel, of the total value of £58,000. The department is, however, mainly engaged in textile industries. Tarare manufactures muslins; Ample, pins and cottons; Thizy, linens. Lyons shares with St Étienne the monopoly of the silk manufacture, the value of the annual production of velvets and ribbons of this second city of France amounting to 20 millions sterling. Lyons, the capital, had in 1901, 453,145 inhabitants.

Rhône, a river of France, rising in Switzerland in the Rhône glacier, between the Furka and Grimel peaks of the St Gothard mass. It flows generally south-west and west, though with many windings, through Switzerland and eastern France to its confluence with the Saône at Lyons, where it turns south to the Mediterranean. The following particulars with regard to the navigation of the Rhône are taken from the *Statistique de la Navigation Intérieure*, 1901. The figures are those for 1900. The tonnage includes wood floated. The Rhône is officially classed in three sections:—(1) From the Swiss frontier to Lyons, 96 miles, mean depth 3·28 feet, crossed by 20 bridges. This includes the so-called *flottable* part between the Swiss frontier and Parc, a distance of 25 miles, but in which the traffic is *nil.* Number of boats, 8469 (of which 8271 in descent); total tonnage of merchandise carried, 197,402. In this section the boats come down laden, but are usually drawn up empty by horses. (2) Lyons to Arles, 178 miles, mean depth 5·25 feet, crossed by 29 bridges. Number of boats, 4628 (of which 3108 in descent); total tonnage, 580,423. (3) Arles to the sea, 30 miles, depth 6·56 feet; boats 1607 (902 in descent); total tonnage, 328,733. *Petit Rhône*, 38 miles, mean depth 5·25 feet, boats 53 (all in descent); total tonnage, 4725.

The SAÔNE is classed between Jonvelle and Lyons; total length 260 miles, in two sections, each comprising two sub-sections:—(1) Jonvelle to Gray, 61 miles; Gray to St Jean-de-Losne, 40 miles; total, 101 miles. Of this the part between Jonvelle and Corre, 7 miles, is classed as *flottable*, but is without traffic, while of the part classed as navigable, a length of about 20 miles to Corre is practically abandoned. From this place the Saône is canalized. Mean depth 6·56 feet, crossed by 53 bridges; number of boats 2785 (1879 in descent); total tonnage, 501,624. (2) St Jean-de-Losne to Verdun 27 miles, Verdun to Lyons 104 miles, total 131 miles, crossed by 50 bridges, mean depth 6·56 feet, number of boats 6914 (5277 in descent); total tonnage, 814,858. The traffic from Ile Barbe across Lyons to the Rhône comprised 4560 boats (3377 in descent); total tonnage, 617,215.

Statistique de la Navigation Intérieure (Ministère des Travaux Publiques), 2 vols. 4to, Paris, 1901.

Rhyl, a seaside resort of North Wales, at the end of the Vale of Clwyd, about half-way between Chester (30 miles east-south-east) and Bangor. It is visited for its fine stretch of sands and its dry and bracing air. Its other attractions embrace an esplanade a mile long, golf links, and a pier 700 yards long. The Queen Alexandra Hospital was opened in 1902 by the Prince of Wales. Population (1891), 6491; (1901), 8473.

Ribeira, a township of Spain, in the province of Corunna, on the extreme south of the peninsula formed by the river of Muros y Noya and the estuary of Arosa. It lies in a hilly country, abounding in wheat, wine, fruit, fish, and game. Its port is Santa Eugenia de Ribeiro, on the Arosa estuary. The church and parish buildings are not worth notice. The population, chiefly occupied in agriculture, rearing of cattle, and fisheries, was 10,352 in 1887, and 10,700 in 1897.

Ribot, Alexandre Félix Joseph (1842——), French statesman, was born at St Omer on 7th February 1842. After a brilliant career at the University of Paris, where he was *lauréat* of the Faculty of Law, he rapidly made his mark at the bar. He was secretary of the Conference of Advocates and one of the founders of the *Société de législation comparée.* During 1875 and 1876 he was successively director of criminal affairs and secretary-general at the Ministry of Justice. In 1877 he made his entry into political life by the conspicuous part he played on the Committee of Legal Resistance during the Broglie ministry, and in the following year he was returned to the Chamber as Moderate Republican member for Boulogne, in his native department of Pas-de-Calais. His impassioned yet reasoned eloquence gave him an influence which was increased by his articles in the *Parlement.* He devoted himself especially to financial questions, and in 1882 was reporter of the

budget. He became one of the most prominent opponents of the Radical party, and distinguished himself by his attacks on the shortlived Gambetta ministry. Notwithstanding his dislike to the policy of colonial expansion he yet joined hands with M. Clémenceau, with whom he shared the chief part in the overthrow of Jules Ferry. At the general election of 1885 he was one of the victims of the Republican rout in the Pas-de-Calais, and did not re-enter the Chamber till 1887. After 1889 he sat for St Omer. He was a determined opponent of the Boulangist movement; and, alarmed by its menace to the existence of the Republic, he became a convert to the policy of Republican concentration. He entered office in 1890 as foreign minister in the Freycinet Cabinet. He had an intimate acquaintance and sympathy with English institutions, and his only published works—an address, *Biographie de Lord Erskine* (1866), and *Étude sur l'acte du 5 avril 1873 pour l'établissement d'une cour suprême de justice en Angleterre* (1874)—both deal with English questions; but he gave a fresh and highly important direction to French policy by the understanding with Russia, which was declared to the world by the visit of the French fleet to Cronstadt in 1891, and which subsequently ripened into a formal treaty of alliance. He retained his post in the Loubet ministry (February–November 1892), and on its defeat was entrusted with its reconstruction, remaining at the Foreign Office, and at the same time becoming president of the Council. In a few days fresh developments of the Panama scandal forced him to drop some of his colleagues. In the new allocation of offices he himself took the ministry of the interior. The Government resigned in March 1893 on the refusal of the Chamber to accept the Senate's amendments to the budget. On the election of Félix Faure as president of the Republic in January 1895, M. Ribot again became premier and minister of finance. By the irony of fate it was the opponent of French expansion in Tongking whose premiership saw Madagascar added to possessions of France; but this expedition had been decided long before, and M. Ribot himself had, in the preceding year, been president of the *commission des crédits* for that purpose. On 10th June he was able to make the first announcement of a definite alliance with Russia. Internal politics centred round the Carmaux strike. On 28th October the premier's action was approved by the Chamber; but two days later the Government was defeated on the question of the *Chemins de fer du Sud*, and resigned office. The real reason of its fall was the mismanagement of the Madagascar expedition, whose cost in men and money exceeded all expectations, and the alarming social conditions at home. M. Ribot was elected, at the end of 1898, president of the important commission on education, a post for which he was peculiarly fitted by his practical experience as professor at the *École des sciences politiques*. His staunch Republicanism did not deter him from an alliance with the forces of reaction and Cæsarism against M. Waldeck-Rousseau; but at the general election of 1902, though he himself secured re-election, his policy suffered a severe check.

Ribot, Theodule Armand (1839- ——), French psychologist, was born at Guingamps, 18th December 1839, and was educated at the Lycée de St Brieuc. In 1856 he began to teach, and was admitted to the École Normale Supérieure in 1862. He was made sub-professor of philosophy in 1867, and Doctor of Letters in 1873. In 1865 he accepted the chair of philosophy at the Lycée de Vesoul, three years later removing to the corresponding chair at Laval, where he remained till 1872. In 1885 he gave a course of lectures on "Experimental Psychology" at the College of France. In 1887 he was decorated with the Legion of Honour. His thesis for his doctor's degree, republished in 1882, *Heredité: étude psychologique*, is his most important and best known book. Following the experimental and synthetic methods, he has brought together a large number of instances of inherited peculiarities; he pays particular attention to the physical element of mental life, ignoring all spiritual or non-material factors in man. In his work on *La Psychologie anglaise contemporaine* (1870), he shows his sympathy with the sensationalist school, and again in his translation of Herbert Spencer's *Principles of Psychology*. Besides numerous articles he has written on Schopenhauer and on the contemporary psychology of Germany, also four little monographs on *Les Maladies de la mémoire* (1881), *De la Volonté* (1883), *De la Personalité* (1885), and *La Psychologie de l'attention* (1888), which supply useful data to the student of mental disease. As the editor of *La Revue philosophique*, a periodical which he himself founded, he has had a useful influence in encouraging the scientific study of psychology.

Ricasoli, Bettino, Baron (1809–1880), Italian statesman, was born at Broglio, 19th March 1809. Left an orphan at eighteen, with an estate heavily encumbered, he was by special decree of the grand duke of Tuscany declared of age, and entrusted with the guardianship of his younger brothers. Interrupting his studies, he withdrew to Broglio, and by careful management disencumbered the family possessions. In 1847 he founded the journal *La Patria*, and addressed to the grand duke a memorial suggesting remedies for the difficulties of the state. In 1848 he was elected Gonfaloniere of Florence, but resigned on account of the anti-Liberal tendencies of the grand duke. As Tuscan minister of the interior in 1859, he promoted the union of Tuscany with Piedmont, which took place on 12th March 1860. Elected Italian deputy in 1861, he succeeded Cavour in the premiership, and upon acquiring personal experience of the Southern provinces, abandoned his regionalist ideas in favour of a thoroughly unitary programme. As premier he admitted the Garibaldian volunteers to the regular army, revoked the decree of exile against Mazzini, and attempted reconciliation with the Vatican; but his efforts were rendered ineffectual by the *non possumus* of the pope. Disdainful of the intrigues of his rival Rattazzi, he found himself obliged in 1862 to resign office, but returned to power in 1866. On this occasion he refused Napoleon III.'s offer to cede Venetia to Italy on condition that Italy should abandon the Prussian Alliance, and also refused the Prussian decoration of the Black Eagle because Lamarmora, author of the alliance, was not to receive it. Upon the departure of the French troops from Rome at the end of 1866, he again attempted to conciliate the Vatican with a convention, in virtue of which Italy would have restored to the Church the property of the suppressed religious orders in return for a gradual payment of £24,000,000. In order to mollify the Vatican he conceded the *exequatur* to forty-five bishops inimical to the Italian régime. The Vatican accepted his proposal, but the Italian Chamber proved refractory, and, though dissolved by Ricasoli, returned more hostile than before. Without waiting for a vote, Ricasoli resigned office and thenceforward practically disappeared from political life, speaking in the Chamber only upon rare occasions. He died at Broglio on 23rd October 1880. His private life and public career were marked by the utmost integrity and by a rigid austerity, which earned him the name of the "Iron Baron." In spite of the failure of his ecclesiastical scheme, he remains one of the most noteworthy figures of the Italian Risorgimento. (H. W. S.)

Richardson, Henry Hobson (1838–1886), American architect, was born in the parish of St James, Louisiana, 29th September 1838. He graduated from Harvard College in 1859, and the same year went to Paris to study architecture, where he was admitted a member of the École des Beaux Arts. After his return to America he opened an office in New York, and was for eleven years (1867–78) in partnership with Mr Charles Gambrill, when he removed to Brookline (Boston), Massachusetts, where he resided till his death, 27th April 1886. His first commission (1866) was to design a church in Springfield, Mass. Thereafter he rose rapidly in his profession, and at the age of thirty-four (1872) was appointed the architect, after competition, for Trinity Church, Boston, of which Phillips Brooks was the rector. The building was dedicated in 1877, and is generally considered to be his masterpiece and the best example of ecclesiastical architecture in the United States. The style of the building, constructed of yellowish-grey granite trimmed with red sandstone, is—like much of Richardson's work—strongly influenced by the Romanesque of the South of France; while the massive square tower in the centre, perhaps the dominating feature, was suggested by the tower of Salamanca. Among his other buildings are the Court House in Pittsburg (which he himself considered his most successful work), the Brattle Square Church in Boston, Sever Hall at Harvard, the town-hall, railway station, and library at North Easton, Mass., and the City Hall, Albany, N.Y. He also designed the Field Building, Chicago, the Chamber of Commerce, Cincinnati, and a number of private residences. (For his place in the development of architecture in America see the article ARCHITECTURE in volume xxv. of this work.) His qualities as an artist have been summarized by an admiring critic and biographer (Mrs Schuyler van Rensselaer, in *Henry Hobson Richardson and his Works*), as strength, clearness, breadth in treatment, imagination, and a love for massive dignity of aspect and often for romantic effect. He married, in 1867, Miss Julia Gorham Hayden, of Boston.

Richepin, Jean (1849–——), French poet, novelist, and dramatist, was born at Medea (Algeria), 4th February 1849. His youth gave evidence of brilliant, if somewhat undisciplined, powers, for which he found physical vent in different directions—first as a *franc tireur* in the Franco-German War, and afterwards as actor, sailor, and stevedore—and an intellectual outlet in the writing of poems, plays, and novels which vividly reflected his erratic but unmistakable talent. A play, *L'Étoile*, written by him in collaboration with André Gill, was produced in 1873; but Richepin was virtually unknown until the publication, in 1876, of a volume of verse entitled *Chanson des Gueux*, whose outspokenness resulted in his being imprisoned and fined for *outrage aux mœurs*. The same quality has characterized his succeeding volumes of verse: *Les Caresses* (1877), *Les Blasphèmes* (1884), *La Mer* (1886), *Mes Paradis* (1894), *La Bombarde* (1899). His novels have developed in style from the morbidity and brutality of *Les Morts bizarres* (1876), *La Glu* (1881), and *Le Pavé* (1883), to the more thoughtful psychology of *Madame André* (1878), *Sophie Monnier* (1884), *Césarine* (1888), *L'Aimé* (1893), *Grandes Amoureuses* (1896), and *Lagibasse* (1899), and the more simple portrayal of life in *Miarka* (1883), *Les Braves Gens* (1886), *Truandailles* (1890), *La Miseloque* (1892), and *Flamboche* (1895). His plays, though occasionally marred by his characteristic proneness to violence of thought and language, constitute in many respects his best work. The most notable are *Nana Sahib* (1883), *Monsieur Scapin* (1886), *Le Flibustier* (1888), *Par le Glaive* (1892), *Vers la Joie* (1894), *Le Chemineau* (1897), *Le Chien de Garde* (1898), *Les Truands* (1899), *La Reine de Tyr* (1900), *La Cavalière* (1901).

Rich Hill, a city of Bates county, Missouri, U.S.A., on the Osage river, at the intersection of the Kansas City, Fort Scott, and Memphis and the Missouri Pacific railways, in the western part of the state, at an altitude of 784 feet. It is in a coal-mining region, and has varied manufactures, including zinc smelting, flour milling, and cigar making. Population (1880), 36; (1890), 4008; (1900), 4053, of whom 255 were foreign-born and 61 negroes.

Richmond, a parish and, since 1890, municipal borough in the Kingston division of Surrey, England, on the Thames, 10 miles west of the City of London by rail. The borough now includes Kew, Petersham, and North Sheen. In 1894 a footbridge and lock were opened. A new church has been erected; also a new theatre and opera house, and a town-hall in the Elizabethan Renaissance style, which cost, with some adjoining pleasure grounds, £24,000. The famous view from the top of Richmond Hill is secured to the public by an agreement, sealed 7th February 1896, between the corporation and the trustees of the Earl of Dysart, by an Act of Parliament of 1902, and by the acquisition in the same year, by the London County Council, with the assistance of the borough of Richmond and other interested local authorities, of the Marble Hill Estate and other property on the Middlesex shore. Population (1881), 19,066; (1891), 26,875; (1901), 31,677.

Richmond, a city of Indiana, U.S.A., capital of Wayne county, on a branch of the river Whitewater, and on the Grand Rapids and Indiana and the Pittsburg, Cincinnati, Chicago, and St Louis railways, in the eastern part of the state, at an altitude of 962 feet. The city is divided into seven wards, has a good water supply and drainage system, and has natural gas. It is in a rich farming region, and has considerable trade and manufactures of varied character. It is the site of Earlham College, which in 1899 had a faculty numbering 15 and was attended by 228 students, about half of whom were women. Population (1890), 16,608; (1900), 18,226, of whom 1467 were foreign-born and 1009 negroes.

Richmond, a city of Kentucky, U.S.A., capital of Madison county, a little east of the centre of the state, on the Louisville and Nashville Railroad, at an altitude of 926 feet. It is in an agricultural region, devoted to the cultivation of tobacco and the raising of fine horses. It contains Central University, a Presbyterian institution, opened in 1874, which had, in 1899, a faculty of 77 and was attended by 811 students, 145 of whom were women. Population (1880), 1424; (1890), 5073; (1900), 4653, of whom 52 were foreign-born and 2087 negroes.

Richmond, the chief city and capital of Virginia, U.S.A., on the north bank of the river James, near the head of navigation and at the foot of the falls. The city spreads over a group of hills, on which it is laid out in a fairly regular plan, and is divided into six wards, which, instead of being numbered, as in most cities, have received names, Clay, Jackson, Jefferson, Madison, Marshall, and Monroe. The water-works, which pump the supply from the river, and the gas-works are owned by the city. It is sewered, and its business streets are paved with granite blocks, while its residential streets are in the main macadamized.

The city has five railways, the Atlantic Coast Line, the Chesapeake and Ohio, the Richmond, Fredericksburg, and

Potomac, the Seaboard Air Line, and the Southern. The large commerce by sea which Richmond enjoyed before the Civil War has in great part disappeared, but its place has been taken by traffic by rail and by manufactures, in which the city has been aided by the fine water-power in the falls of the James. In 1900 Richmond contained 763 manufacturing establishments, with a total capital of $20,848,620. They employed 16,692 hands, and the product was valued at $28,900,616. Of this large total, the manufacture of tobacco made more than one-third, or $10,537,803, which illustrates the importance of the place as a tobacco market. Other manufactures of importance were boots and shoes, flour, fertilizers, and foundry and machine-shop products. Richmond is the seat of Richmond College, a Baptist institution opened in 1832. In 1899 it had a faculty of 17 and was attended by 262 students. Womans College, of the same denomination, opened in 1854, had in 1896–97 a faculty of 19, and was attended by 205 students. The assessed valuation of real and personal property was, in 1899, $69,552,821, the net debt of the city was $6,856,604, and the rate of taxation, $18·00 per $1000. Population (1890), 81,388; (1900), 85,050; of whom 2865 were foreign-born and 32,230 negroes.

Richmond, Sir William Blake (1842– ——), English painter and decorator, was born in London on 29th November 1842. At the age of fourteen he entered the Royal Academy schools, where he worked for about three years; but he was also guided in his art education by the teaching of his father, George Richmond, R.A., and by the advice of John Ruskin, who took much interest in his career. A visit to Italy in 1859 gave him special opportunity for studying the works of the old masters, and had an important effect upon his development. His first Academy picture was a portrait group, exhibited in 1861; and to this succeeded, during the next three years, several other pictures of the same class. In 1865 he returned to Italy, and spent four years there, living chiefly at Rome. To this period belongs the large canvas, "A Procession in Honour of Bacchus," which he exhibited at the Academy in 1869 when he came back to England. A visit to Algiers followed in the winter of 1870; in 1882 and 1883 he travelled through Greece and the Aegean Isles; and in 1885 went to Egypt, making on each occasion a great number of studies of the local scenery and architecture. His picture, "An Audience at Athens" (see Plate), was exhibited at the Grosvenor Gallery in 1885. He became Slade professor at Oxford, succeeding Ruskin, in 1878, but resigned three years later. He was elected an Associate of the Royal Academy in 1888, and Royal Academician in 1895; he received the degree of D.C.L. in 1896, and a knighthood of the Bath in 1897, and has held the office of professor of painting to the Royal Academy. His pictures have always been distinguished by notable qualities of design and by sound knowledge of the human form, and his portraits by elegance and refinement; but perhaps his highest capacity appears in his decorative work. His most conspicuous achievement in this branch of art is the internal decoration and the glass Mosaics of St Paul's Cathedral. Sir William Richmond has, it should be added, taken a keen interest in social questions, particularly in smoke-prevention in London.

Richter, Eugen (1839– ——), German politician, was born on 30th July 1839 at Düsseldorf. After attending the universities of Bonn, Heidelberg, and Berlin he entered the Government service, being stationed in his native town. In 1864 he was chosen burgomaster of Neuwied; but he was already known for his Liberal opinions, and the Government refused to confirm the appointment. He was hereupon transferred to Bromberg, in East Prussia, which to an inhabitant of the Rhineland was the worst form of exile, and in consequence he resigned his place in the public service. He now went to Berlin, where he earned his living as a journalist. He had already published a pamphlet advocating the freedom of public-houses from the control whether of gilds or the police, and was the most consistent advocate of those doctrines of *laissez faire* and individual liberty which the Germans call *Manchesterthum*. He was also keenly interested in the attempts made at that period to create co-operative societies among the working men, and wrote a work on co-operative stores. It was not long before he came into conflict with the Government; an electioneering pamphlet published in 1867 was confiscated; he was put on his trial but acquitted. In 1867 he was elected a member of the newly-formed Reichstag, and in 1869 of the Prussian Parliament. He soon became one of the most influential politicians in Germany. No one was more assiduous in his attendance or more frequent as a speaker; endowed with great fluency and an admirable memory, quickness in rejoinder, and a very great knowledge of affairs, and especially of financial matters, he at length became the most experienced member of Parliament in Germany. A member of the Progressive party, in 1880 one of the founders, and eventually the leader, of the *Freisinnige*, he was always in opposition. Next to Windthorst (*q.v.*) he was Bismarck's most dangerous opponent. After the great change of policy in 1878, for a time his influence was a great impediment to the Government; as a consistent adherent to free trade, he was the leader of the opposition to the introduction of protection, to the new Colonial policy, and to State Socialism. It was after 1880 that he raised the cry *Bismarck muss fort*. He always took a great part in debates on the military and naval establishments, in vain opposing the constant increase of army and navy. It was his refusal to support the Government proposals in 1893 for an increase of the army which led to the break up of his party: he was left with only eleven followers; and except among the middle class of Berlin and some other Prussian cities, the old Radical party, of which he was the chief representative, from that time had little influence in the country. Though a bitter enemy both to Clericalism and to Socialism, it is to his credit that he had so much faith in the justice of Liberal principles that he never was led to support the exceptional legislation by which the Prussian Government and the German people attempted to crush opinions with which they did not agree. He was equally active as a writer. Since 1882 he has been editor of the *Freisinnige Zeitung*; of his numerous brochures the most successful was his attack on Socialism, entitled *Der socialistische Zukunfts-Staat*, a clever and successful satire on the Socialist State of the future. This has been translated into English. He also wrote much on Prussian finance, and under the title *Das politische A, B, C Buch* compiled a very useful political handbook for Radical voters. He also published reminiscences of his youth (*Jugend-Erinnerungen*), and two volumes of parliamentary reminiscences (*Im alten Reichstag*).

Richter, Hans (1843– ——), Hungarian musical conductor, born at Raab, 4th April 1843, was the son of the Domcapellmeister there and of his wife, *née* Josephine Csazinsky, the first Viennese Venus in *Tannhäuser*. Naturally, the offspring of this couple was musical. Young Hans sang either soprano or alto in the Cathedral choir, according to requirement, and occasionally played the organ. But his public début was made as a drummer in Haydn's *Paukenmesse*. In 1853, at the age of ten, he appeared in a concert as pianist in

"An Audience in Athens during the Representation of the 'Agamemnon.'" By Sir W. B. Richmond, R.A.
(By permission of the Art Gallery Committee of the City of Birmingham.)

Hummel's E flat quintet; and in 1854, after his father's death, went to the Löwenburg Convikt (where Schubert was educated) in Vienna, and there became chorister in the Court Chapel. For five years from 1860 Richter studied under Heissler and Sechter in the Vienna Conservatorium, and the horn under Kleinecke. A year and a half after his first lesson he became hornist in the old Kärnthnerthor Theatre at £3 a month. Meanwhile he had devoted time to conducting. His orchestral post he resigned in 1866 on being appointed copyist to Wagner, then living at Triebschen, near Lucerne. There he copied *Die Meistersinger*. In December of the following year Von Bülow induced him to go to Munich, where he actually sang the part of Kothner in the 6th performance of *Die Meistersinger*. It was not till August 1868 that Richter made his first appearance as a conductor, at the Hof Theater, Munich (where he had just been appointed), in *William Tell*; but in the next year he resigned this post, went first to Paris, then to Brussels, and finally to Triebschen, where he copied *Der Ring des Nibelungen*. In April 1871 Richter took up his new duties as conductor of the Hungarian National Opera at Budapest, where he remained four years, until he began in May 1875 his long connexion with the Vienna Opera, which terminated only with the century. In the same year Richter directed the rehearsals and performances of *Der Ring* at Bayreuth, and in 1877 paid his first visit to England to conduct the Wagner Festival at the Albert Hall. There in 1879 he founded the Richter Concerts; in 1885 he became conductor of the Birmingham Triennial Festival, and was created Mus. Doc. Oxon. *honoris causâ*. In 1882 Richter also conducted a famous series of performances of Wagner's works (including the first in England of *Die Meistersinger* and *Tristan*) at Drury Lane, and some years afterwards became conductor of the Hallé Orchestra in Manchester. That Richter must be considered one of the most richly gifted and the most experienced of modern conductors is universally acknowledged. In the works of Beethoven and Brahms his surpremacy is unchallenged, while as a Wagnerian conductor few have reached his level.

Rickets. See PATHOLOGY: *Metabolic Diseases*.

Ricotti, Magnani Cesare (1822–——), Italian general and knight of the Annunziata, was born at Borgo Lavezzaro on 30th June 1822. As artillery lieutenant he distinguished himself and was wounded at the siege of Peschiera in 1848, and in 1852 gained further distinction by the courage with which he sought to prevent the explosion of a burning powder magazine. After serving from 1856 to 1859 as director of the Artillery School, he took part in the war against Austria, and commanded the 5th division at the battle of San Martino. In the war of 1866 he stormed Borgoforte, to open a passage for Cialdini's army. Upon the death of General Govone in 1870 he was appointed minister of war, and after the occupation of Rome bent all his efforts to army reform, in accordance with the lessons of the Franco-German War. He shortened the period of military service; extended conscription to all able-bodied men; created a permanent army, a mobile militia, and a reserve; commenced the renewal of armaments; and placed Italy in a position to put 1,800,000 men on a war footing. Ricotti fell from power with the Right in 1876, but returned to office with Depretis in 1884, and amended his previous scheme of reform. Resigning in April 1887, he took little part in public life until 1896, when, after the battle of Adowa, he was entrusted by King Humbert with the formation of a Cabinet. Having constructed his ministry, he made over the premiership to the Marquis di Rudini, retaining for himself the portfolio of war, and seeking to satisfy popular demands for the reduction of military expenditure by consolidating the tactical structure of the army without weakening its fighting power. Rudini, however, finding that Ricotti's ideas, which he himself shared, were not acceptable in the highest quarters, obliged him to resign office. His prestige as creator of the modern Italian army remained unimpaired, and his views on army consolidation enjoyed a large measure of technical and public favour.

Riesa, a town of Germany, on the Elbe, 12 miles by rail north-north-west of Meissen, in the circle of Dresden, kingdom of Saxony. There are 2 churches, a harbour with quays and a dockyard, rolling-mills and saw-mills, agricultural implement and other works, and sandstone quarries. The most important shipping station on the Elbe in Saxony, Riesa is the lading-place for transmarine goods to and from Bavaria, and a mart for herrings, petroleum, coal, grain, &c. Population (1890), 9389; (1900), 13,492.

Rifle.—A rifle is a musket with a grooved bore. The rifling of a firearm is the cutting away of the interior of the barrel or bore so as to form spiral grooves upon its surface. The objects of this spiral grooving are to guide the projectile down the barrel, force it to turn upon its own axis and impart to it a rotatory motion which it shall maintain during flight, and thus equalize any irregularities in its form or weight, and so lessen the tendency to depart from a straight line, and also in a measure to overcome atmospheric resistance. Rifling was invented about 1520, by Gaspard Kollner, a gunmaker of Vienna, according to some authorities; by Augustus Kotter of Nuremberg, according to others. In some cases the grooves were made straight, to admit a tight-fitting bullet and relieve the effects of fouling; they were more usually spiral. Parallel, half-round narrow grooves, probably two or more in number, constituted the rifle in its most primitive form; later, from three to twelve grooves were more common. The amount of turn varied in old rifles, from a half or three-quarters turn to one turn in two to three feet. The form and depth of grooving also greatly varied. Rifles were at first used for amusement, and were not employed in warfare until about the middle of the 17th century.

Military Rifles.—Rifles were not generally used in the British army until 1855. There are, however, instances of their occasional employment in the 17th and 18th centuries, particularly by Continental nations. In 1631 the Landgraf of Hesse had a troop of riflemen. Ten years later Maximilian of Bavaria had several troops armed with rifled arquebuses. Louis XIII. armed his bodyguard with rifles. Napoleon withdrew the rifle from his troops, to whom it had been issued during the wars of the Republic, nor did the French make any considerable use of it again until 1830, when the Chasseurs d'Orleans were armed with it for the invasion of Algeria. The British learnt the value of rifles during the American War of Independence, when the Government subsidized Continental *Jägers* armed with rifles to oppose the American backwoodsmen, whose rifle-shooting was most deadly.

It is interesting here to note the chief infantry firearms that preceded the modern military rifle. The hand cannon of 1471 was quickly superseded by the matchlock, which remained in use until the Commonwealth. About 1530 the wheel-lock was first brought to England, but few were supplied to English soldiers until the time of Charles I. In the reign of James I. some flint-locks were issued to leading regiments, and in the reign of William III. they came into general use. From them was developed the renowned "Brown Bess," a flint-lock smooth bore, for a century and a half the regulation musket of the British Army. Thus the weapon that won at Waterloo was

of the same type as that which the British used at Ramillies and Blenheim. In the Brown Bess and similar military muskets the bullet was two sizes smaller than the bore, wrapped in a loosely-fitting patch which formed the cartridge; the loading was therefore easy, whereas the muzzle-loading rifle with a closely-fitting ball was loaded with difficulty, particularly when foul, and for this reason was not generally used as a weapon of war. The Brown Bess had a high trajectory and a very low velocity, with an effective range of under 200 yards. The percussion system was only generally applied to the Brown Bess in 1842, a quarter of a century after its invention, and after an elaborate test at Woolwich in 1834. In 1800 the 95th Regiment (afterwards the Rifle Brigade) were armed with a weapon known as "Baker's Rifle," which weighed 9½ lb. The barrel was 2½ feet long, its calibre 20 bore, with seven grooves making a quarter turn in its length. A small wooden mallet was at first supplied with this rifle to make the ball enter the barrel, and it was loaded with great difficulty. In 1826 Delvigne, a French infantry officer, invented a breech with abrupt shoulders on which the spherical bullet was rammed down until it expanded and filled the grooves. The objection was that the deformed bullet had an erratic flight. In William IV.'s reign the Brunswick rifle was introduced into the British army. Its weight with bayonet was 11 lb 5½ ozs.; length of barrel 2 feet 6 inches; with two grooves making one turn in the length of the barrel; weight of spherical belted bullet 557 grs.; diameter ·696 inch; charge of powder 2½ drs. This rifle was not easily loaded, soon fouled, and shot wild beyond 400 yards.

In 1835 W. Greener produced a new expansive bullet, an oval ball, a diameter and a half in length, with a flat end, perforated, in which a cast metallic taper plug was inserted. The explosion of the charge drove the plug home, expanded the bullet, filled the grooves and prevented windage. A trial of the Greener bullet in August 1835, at Tynemouth, by a party of the 60th Rifles, proved successful. The range and accuracy of the rifle were retained, while the loading was made as easy as with a smooth-bore musket. The invention was, however, rejected by the military authorities on the ground that the bullet was a compound one. In 1852 the Government awarded Minié, a Frenchman, £20,000 for a bullet of the same principle adopted into the British service. Subsequently in 1857 Greener was also awarded £1000 for "the first public suggestion of the principle of expansion, commonly called the Minié principle, in 1836." The Minié bullet contained an iron cup in a cavity at the base of the bullet. In 1851 a rifle musket of the Minié pattern was introduced into the British army, and, though not generally issued, was used in the Kaffre War of 1851, and in the Crimea at the battles of the Alma and Inkerman. Its weight with bayonet was 10 lb 8¾ ozs., length of barrel 3 feet 3 inches, with four grooves, making one turn in 78 inches; charge of powder 2½ drs., and sighted from 100 to 1000 yards. The form of its bullet was at first conoidal, afterwards changed to cylindro-conoidal with a hemispherical iron cup. In 1855 the Enfield rifle, having in a series of trials competed favourably with the Minié and Lancaster rifles, was introduced into the British army; was used during the latter part of the Crimean war, having there replaced the Minié rifle pattern 1851 and the percussion musket 1852, and remained the general weapon of the entire infantry until the introduction of the breech-loader in the year 1867. This rifle weighed, with bayonet, 9 lb 3 ozs., with 39-inch barrel; diameter of bore ·577 inch; three-grooved with one turn in 78 inches. It fired a bullet of cylindro-conoidal form with hollow base, weighing 530 grains, made up into cartridges and lubricated as for the Minié rifle, adapted to this rifle by Pritchett, who was awarded £1000 by the Government. Short rifles of the same pattern, with five-grooved barrels 2 feet 9 inches long, and a sword bayonet, were supplied to the 60th Rifles and to the Rifle Brigade. Two small carbines of the same principle were at this time introduced for the cavalry and artillery, also a rifled pistol.

In 1854 Lord Hardinge, then Commander-in-Chief of the British army, sought the aid of Sir Joseph Whitworth, the first mechanician of the day, in considering the subject of rifling. After a long series of experiments the Whitworth rifle was produced with hexagonal bore, ·45 inch calibre, and with one turn in 20 inches. It was tried at Hythe in 1857, and beat the Enfield rifle by 3 to 1, up to 1800 yards upon a fixed rest. This trial and Whitworth's experiments proved the advantages of a sharp twist, a smaller bore, and elongated projectile; but Whitworth's rifle was never adopted into the Government service, probably because the hexagonal rifling wore badly, and owing to the difficulty of equal mechanical perfection in all similar rifles and ammunition. Several improvements were subsequently made in the sighting, grooving, and some other details of the Enfield rifle. In 1855 a box-wood plug to the bullet was used.

Between 1857 and 1861 four breech-loading carbines were experimentally introduced in the cavalry—viz., Sharp's, Terry's, Green's, and Westley-Richards'. The general adoption of the breech-loading principle may be said to date from 1867. The Prussians were the first to see its great advantages, and in 1848 had adopted the needle-gun breech-loader, afterwards so celebrated in the Danish war of 1864, against the Austrians in 1866, and against the French in 1870. In June 1864, and in October 1866, special military committees were appointed by the British War Office to consider and report on breech-loading arms, and proposals were invited from the various gunsmiths and manufacturers. Jacob Snider's method of conversion of the muzzle-loading Enfield to a breech-loader was first adopted, out of nearly fifty different proposals, and after laborious and protracted experiments, with the metallic cartridge-case improved in 1867 by Colonel Boxer, R.A. All available Enfield rifles were thus converted, and new arms made with steel barrels instead of iron. Great Britain was the first Power to adopt for her army a breech-loading rifle with metallic cartridge-case, which effectually secured the perfect obturation of the breech. In 1866 France adopted the Chassepôt rifle; in 1867 Sweden the Hagström, and Russia the Carte; in 1868 Italy the Carcano. All these were breech-loaders firing paper cartridges containing their own means of ignition. After further experiments by a fresh committee the Martini-Henry rifle was definitely adopted by the British Government in April 1871, with the short chamber Boxer-Henry ammunition. This rifle was a combination of Martini's block-action breech mechanism with Henry's barrel of ·45-inch calibre, firing a bullet of 480 grains from Boxer cases with a wad of wax lubrication at base of bullet, as proposed by Henry. The Henry rifling had seven grooves with one turn in 22 inches; the lands and the centres of the grooves were contained in the same circle. In the same year Spain adopted the block-action Remington rifle, Germany the Mauser, Holland the Beaumont, Italy the Vetterli, and Russia the Berdan II., all bolt-action rifles. All these weapons had a calibre of about 11 millimetres (·433 inch).

The next stage in the history of military firearms was the introduction of the repeating or magazine system. The Winchester rifle, an American invention, appeared in 1867 as one of the earliest magazine rifles. This weapon was used by Turkey in the Russo-Turkish war of 1877–78,

and there proved the enormous advantage of the repeating or magazine rifle, owing to its largely increased rapidity of fire. Meanwhile, in 1886 the question of the best calibre for small arms was reopened in England. In June 1887 the Small Arms Committee, after experiments with the small-calibre rifle invented in 1883 by Major Rubin, director of the Swiss Laboratory at Thun, recommended the small calibre for adoption into the British service. The essential features of Rubin's system were the employment of a compound bullet with a leaden core in a copper envelope, and the use of a compressed charge of black powder. In January 1888 a pattern of ·303-inch-calibre rifle, rifled on the Metford system and with the improved Lee bolt and magazine, was approved for trial by British troops. The Metford rifling is as follows:—diameter of bore, ·303″; depth of rifling, ·004″; width of lands, ·023″; twist of rifling, one turn in 10″ (left hand); radial grooves, 7 in number. About 1862, and later, W. E. Metford had carried out an exhaustive series of experiments on bullets and rifling. He invented the important system of light rifling, with increasing spiral with a hardened bullet. The Metford match rifle was prominent in all N.R.A. competitions from 1871 to 1894. In 1887 he laid down for the Small Arms Committee the proper proportions for the grooving, spiral, and cartridge chamber of the ·303 military rifle. This weapon proved satisfactory, and was finally adopted by the War Office as the Lee-Metford Rifle, Mark I., in December 1888. It had a magazine of eight cartridges. In December 1891 the Mark II. pattern was finally approved, with a ten-cartridge magazine, a much-simplified bolt, and many minor improvements. A magazine carbine, with barrel 21 inches long and a six-cartridge magazine, otherwise identical with the Lee-Metford Mark II., was also approved. The Lee-Metford Mark II. rifle has been further improved in its rifling to resist the wear of smokeless powder, and also in its bolt action, and is now known as the Lee-Enfield rifle, and under that name has been officially adopted as the rifle of the British army. The number of grooves has been reduced from seven to five. Neither the Lee-Metford nor the Lee-Enfield has increasing spiral grooves, which are found inconvenient for military arms from a manufacturing point of view.

The efficiency of the modern small-bore magazine rifle is largely due to the production and adoption of smokeless nitro-compound powder within recent years. France was the first country to adopt, about 1885, a smokeless powder with the Lebel magazine rifle. It was known as "Vielle" powder, or "Poudre B." Since then smokeless explosives have been universally adopted in all small-bore magazine military rifles. After exhaustive and lengthened experiments the smokeless explosive known as "Cordite," a composition of nitro-glycerine, gun-cotton, and mineral jelly, has been definitely adopted by the British authorities for the cartridges of the Lee-Metford and Lee-Enfield magazine rifles and other arms of the same calibre. In addition to its smokelessness, it possesses the further advantages of being comparatively non-fouling, giving a much higher muzzle velocity, with a smaller charge, than black powder, owing to the greater amount of gas produced, and at the same time developing lower maximum pressures, owing to its homogeneous character. (For further information about explosives, see PROPELLANTS.)

It is difficult to imagine how any further substantial improvement can be effected in the range and trajectory of the modern magazine rifle, although its mechanism, rifling, and rapidity of fire may continue to be improved. Its great value in warfare and the effect of its high velocity, low trajectory, long range, and smokeless ammunition on military tactics and strategy were fully demonstrated by the Boer war of 1899–1902. The Lee-Enfield military rifle weighs 10 ℔ 3½ ozs. with bayonet; is 4 feet 1·85 inches in length (without bayonet), with a barrel of 30·197 inches long; ·303 calibre, with five shallow grooves of increasing spiral with a left-hand turn of 1 in 10″; fires a long thin nickel bullet with leaden core with smokeless cordite explosive from a solid metallic cartridge-case; carries a ten-cartridge magazine with bolt-action and a cut-off that enables the rifle to be used as a single firer; and is sighted up to 2800 yards.

Match or Target Rifle.—The sport or pastime of target shooting has many times changed its character, owing to the steady improvement in the rifle and the different ranges or distances at which shooting is practised. Range usually governs the construction of the target rifle, long-range rifles not being necessarily the best weapons for a short range of, say, 200 yards. Limitations —such as the amount of powder charge, weight of bullet and rifle—are also usually arbitrarily imposed in order to encourage marksmen by starting all competitors on equal terms. The long-range match rifle is not the superior of the military rifle as a weapon, but as a scientific shooting instrument is the best small arm produced. The ordinary target rifle is a hybrid arm, combining the points of the long-range match, modern military, and best sporting rifles. The miniature match rifle is a gallery weapon, adapted for trick shooting, for a beginner, or for short-range practice.

The pastime of rifle shooting at fixed marks has been practised continuously in Switzerland from mediæval times. A rifle club ("Société de l'harquebuse et de la Navigation") has existed continuously in Geneva since 1474; and the "Schutzen-Gesellschaft der Stadt Zürich" since about the same date. It is not clear at what period rifles superseded smooth-bores in the practices of these clubs. From the beginning of the 19th century up to 1844 the rifle generally used in Great Britain had a polygrooved barrel ·630 inch in diameter, with spherical ball, and the arm weighed from 11 to 15 ℔. It was not fired in military fashion, but had a handle extending downwards fixed in front of the trigger-guard which was grasped by the left hand, the left arm being steadied against the body. This method of shooting is still followed by Swiss and German riflemen. The Swiss and Americans were formerly accredited as the finest rifle shots in the world, and are still fine rifle shots at medium ranges and with their customary conditions allowed. At long ranges they are behind the standard of shooting now ruling in Great Britain and her colonies. Target shooting as a sport or business was rarely practised in Great Britain until after the Crimean war and the establishment of volunteer rifle corps. Ranges were then obtained for practice. The inauguration of the "National Rifle Association" in 1860 opened a new and most important era in the history and development of the rifle. This admirable institution was established "for the encouragement of rifle corps and the promotion of rifle shooting throughout Great Britain. . . . As a national pastime to make the rifle what the bow was in the days of the Plantagenets, the familiar weapon of those who stand forth in the defence of their country." The N.R.A. has identified itself with the history of target rifle shooting wherever the English language has penetrated, and full information of such history will be found in its annual reports. The first meeting of the N.R.A. was held at Wimbledon in 1860. The first shot was fired by the Queen from a Whitworth rifle on a machine rest, at 400 yards, and struck the bull's-eye. The Whitworth muzzle-loading rifle won many of the important prizes at this and subsequent meetings prior to 1871. The use of this rifle was, up to that date, compulsory in the final stage of the

Queen's competition, except in 1865–66–67. Its most important features, arrived at after exhaustive experiments, were a smaller bore of ·450 inch, with an increased twist of rifling of one turn in 20 inches, and an elongated mechanically-fitting projectile. Long-range rifle construction is also largely indebted to Whitworth for the highly accurate and superior tools and processes introduced by him in this branch of manufacture.

In 1866 and after, Metford's system of hardened expanding bullets and shallow rifling gradually superseded the mechanically-fitting system of Whitworth, and the Whitworth rifle gradually lost its position.

In 1861 the Henry grooving for a cylindrical bullet, a modification of the Whitworth, first appeared. In 1864 Rigby, with a five-grooved rifle and a mechanically-fitting bullet, tied with the Whitworth rifle in the preliminary rifle trial of the N.R.A. at 1000 yards, and in a subsequent trial took the first place. In 1865 the Rigby rifle was consequently used in the second stage of the Queen's prize. By 1871 the Whitworth rifle had given place to the Metford system with hardened cylindrical bullets, shallow rifling, and increasing spiral. In 1867 the modern breech-loading rifle was first introduced, using a metallic cartridge containing its own means of ignition. The Metford system of rifling greatly assisted its development. In this year Rigby also produced his new model long-range rifle on the lines followed by Metford. In 1869 the work of the Government Committee caused a great impulse to be given to experimental rifle manufacture, and the Henry barrel came well to the front when used as a breech-loader. In 1870 the Martini-Henry, the new service arm, won the duke of Cambridge's prize, the extreme range in this competition being 800 yards. In 1871 the Enfield-Snider breech-loader replaced the Enfield muzzle-loader, and the Martini-Henry replaced the Whitworth in the second stages—800, 900, and 1000 yards ranges—of the Queen's prize. The Metford barrel was also used in breech-loaders, and the duke of Cambridge's prize—for the first time fired at 1000 yards—fell to it. During the twenty-three years from 1871 to 1894 the Metford military match rifle only four times failed to win this prize, while it took a preponderating share of other prizes. The years 1872 and 1873 marked a decided advance in the military breech-loader, though for fine shooting the muzzle-loader still seemed hard to equal. In 1873 an Irish team armed with Rigby muzzle-loading rifles visited Creedmoor, U.S.A., and were defeated by three points only by an American team armed with breech-loading rifles. In 1875 a team of American riflemen first visited Wimbledon with "army-pattern" breech-loading rifles, which were cleaned out after every shot, and met with considerable success. A feature of their shooting was the "back position," then a novelty. In 1876 the duke of Cambridge's prize was easily won with a Metford breech-loader, the same type of rifle also doing well in other long-range competitions. A great rifle contest took place at Creedmoor, U.S.A., this year—Ireland, Scotland, Australia, and Canada sending teams, the conditions being those of the Elcho Shield competition. A United States team secured first place, the Irish team being a close second. In 1877 the superiority of the cleansable and cleansed breech-loader over the increased fouling of the muzzle-loader was clearly demonstrated, though the muzzle-loader did not at once disappear. In 1878 the highest scores ever made with the muzzle-loader in Great Britain were recorded, greater care in cleaning the rifle after every shot being observed.

In 1883 the N.R.A. Council altered the conditions, wiping out after every shot was forbidden, but muzzle-loaders were not disqualified. The result was that the American type of rifle disappeared. The poor shooting of the Martini at 1000 yards induced the Council to take the retrograde step of reducing the maximum range for the Queen's prize to 900 yards, the 1000 range being considered beyond the power of the weapon. In 1890 the N.R.A. first met at the new ranges at Bisley. This year was noticeable for the excellent shooting made in the "any" rifle competitions by the Gibbs-Metford match rifle, particularly at 1000 yards range. The accepted type was ·461 calibre; 7 grooves ·0045 inch in depth; 80 grains of special black gunpowder, and a bullet of 570 grains. In 1892 and 1893 the Lee-Metford ·303 rifle with cordite ammunition was first used by the army teams. In 1890 and later the Hon. T. F. Fremantle and some others used Metford's copper-coated bullets in the Gibbs-Metford rifle with success, and in 1894 Captain Gibbs used these in his match rifle and achieved remarkable results, in many competitions making top scores. In 1895 many match rifle shots followed his example and used copper-coated bullets. In 1895 and 1896 the ·303 was equalled, and in some instances beaten, by the smaller-calibre Mannlicher rifle. This was partly due to faulty Lee-Metford ammunition. The ·303 now proved its superiority to the ·450 Martini, the regulars defeating the volunteers, especially at the longer ranges. The Bisley meeting of 1896 practically closed the series of contests with both the Martini and the military match rifles. The volunteers were to be thenceforth armed with the ·303, and with that bore future contests for the Queen's and St George's were to be held.

The results of the Bisley meetings since 1895 have proved that rifles of ·303 class, the British ·303 rifle particularly, are not so good for match rifles pure and simple as the larger bores using black powder. The light bullets are more subject to deflection by the wind at long ranges than the heavier speed-retaining bullets of the larger bores. Cordite powder cartridges also appear to give varying velocities. None of the nitro-powders used appears to have equalled the black powder in regularity of shooting. At the same time the object of the N.R.A. competitions is to encourage excellence in the use of the military service rifle in the first place, and in the case of the "any" rifle competitions to encourage the production of weapons of the highest efficiency for military purposes. Acting on these principles the rifles and carbines allowed by the N.R.A. regulations (1900) are classed as follows:—*Class I.*—Service rifle (S.R.): ·303 magazine rifles as issued by the Government or bearing the Government viewer's mark; inclusive weight not to exceed that of the corresponding regulation rifle; maximum length, 49½ inches; minimum pull of trigger, 6 lb; sights—strictly in accordance with Government service pattern, and without any shading appliances, extraneous supports, or laterally sliding wind-gauge. This is the rifle to be used in all the numerous S.R. competitions at Bisley, including the duke of Cambridge's prize, the St George's challenge vase, and the King's prize. *Class II.*—Match rifles (M.R.): any breech-loading rifle complying with the following conditions: when of British make to bear proof marks on barrel and breech; maximum weight, 10 lb; maximum length, 52 inches; maximum calibre, ·315; stock sufficiently strong, in the opinion of the Bisley committee, for service purposes, and without pad or shoe on the heelplate; minimum pull of trigger, 6 lb; sights, of any description except telescopic or magnifying. *Class III.*—Sporting rifles (Spor.): calibre, any; minimum pull of trigger, 3 lb; sights, open or such as are sanctioned by the council or committee. The Lyman backsight and the Beech combination foresight have been sanctioned. No lateral adjustment of fore or backsight is permitted.

Spirit levels are allowed. *Class IV.*—Carbines (Car.). Any *bonâ fide* Government pattern of carbine of ·303 calibre as issued by the Government or bearing the Government viewer's mark. Minimum pull of trigger, 6 ℔. Only service ammunition issued by the N.R.A. at the firing point is allowed to be used in the S.R. competitions. In M.R. competitions there are certain restrictions as to weight of bullet and length and diameter of cartridge. In sporting competitions any ammunition may be used.

Modern American Target Rifles.—In America, according to some authorities, there are three recognized departments of target shooting—namely, off-hand shooting; shooting from a simple rest; and shooting from a machine rest, with telescopic or any other sight. For the first two classes small-bore rifles of ·380 calibre or under only are used. The usual weight is from 8 to 10 ℔, with 28- or 30-inch barrel. Light charges for the shorter ranges are used. In the ·380 bore only 55 grains of powder with a 330-grain bullet is employed. In the second-class contests, from a simple rest, the barrel is longer and the weight increased to just under 12 ℔. The bore is generally ·380. The usual range is 200 yards. The third-class shooting from a machine rest, generally with telescopic sights, is not much practised. Every kind of rifle is employed, usually of large bore and weighing from 20 to 60 ℔. The long-range breech-loading match rifle, with which so much fine shooting was done when wiping out after each shot was allowed, weighed about 10 ℔; the breech mechanism, any falling block, as the Sharp, Farquharson, Deeley, and Edge or Wiley, that admitted the insertion of the cleaning rod at the breech; length of barrel 32 to 34 inches; seven or more grooves ·003 to ·005 in depth with a complete turn in 20 inches. A sharp continual spiral and very shallow grooves constituted the feature of the American plan. Rigby's plan was similar, with one turn in 18 inches and eight grooves, the lands being about half the width of the grooves. In the Wiley the grooves were fewer and wider. The Metford is an increasing twist, starting with one turn in 60 inches and finishing with one in 20, or sharper. The usual bore of the American long-range rifle was ·458 or ·461; powder, 76 grains of special "fouling" rifle powder; elongated cylindrical bullet of 540 grains. The pull-off was under 3 ℔. During recent years smaller-bore smokeless-powder rifles have also been used.

Continental Match Rifles.—The target rifle used by Continental marksmen is a modification of the old pattern Swiss rifle, with scroll guard, hollowed butt plate and hair trigger. This latter, a mechanical device to free the tumbler from the skear without sufficient pull on the trigger to influence the aim, is disallowed in military arms.

Sporting Rifles.—Prior to 1845 smooth-bore ball guns with double charge of powder and an ounce spherical ball were generally preferred to rifles for sporting purposes and for large game; sixteen-bore muzzle-loading rifles were occasionally used by British sportsmen in the East Indies before that date, firing $1\frac{1}{2}$ drs. of powder with a spherical ounce ball. These rifles were sighted to 200 yards, but the trajectory was high and the penetration weak; they were also difficult to load when foul. The twist of the rifling was also too rapid, causing the bullet to strip with heavy charges of powder. According to Captain Forsyth and others, up to 1860 there was no known rifle suitable for sporting purposes in India. Rifles of twelve-bore gauge, firing a spherical ball, were subsequently made, with broad and shallow grooves making one turn in 10 feet. The bullet, of the same diameter as the bore, was loaded with a thin patch that took the grooving. These rifles proved very successful, possessing velocity equal to a smooth-bore of the same calibre, accuracy for sporting distances, flat trajectory, and great striking power. In 1855 W. Greener produced the "Cape rifle" for South African sport, calibre ·450 or ·500; rifling, two deep grooves with one turn in 26 inches, with a flanged bullet to fit the grooves; weight, 12 ℔; sighted up to 1200 yards. This rifle was successful, and others were built by Purdey, who in 1856 named the pattern "Express Train." Since that date the word "Express" has been generally used to denote a rifle possessing high velocity, flat trajectory, and long fixed-sight range.[1] In America small-bore rifles were used earlier in the 19th century. The celebrated Kentucky rifles were of various sizes, firing spherical balls of 90, 60, and 40 to the ℔, and were renowned for their accuracy and fixed-sight range up to 100 yards. Some suppose that the modern Express rifle was developed from the Kentucky model. The modern Express rifle may be defined as a breech-loading rifle with a trajectory not exceeding $4\frac{1}{2}$ inches at 150 yards, with a muzzle velocity of at least 1750 feet per second. These rifles are usually double-barrelled, with 26- to 28-inch barrels of ·360, ·400, ·450, ·500, and ·577 bores, weighing respectively from $6\frac{1}{2}$ to 7 ℔, 7 to 8 ℔, $7\frac{3}{4}$ to 9 ℔, $8\frac{1}{4}$ to 10 ℔, and $10\frac{1}{4}$ to 12 ℔. The respective charges usually are: bullet, 150 grains; powder, 50 grains; 209 and 82; 270 and 110; 340 and 130; 520 and 160; but the leading gunmakers vary the respective amounts of these charges. The fixed-sight ranges of these rifles are respectively 130, 160, 150, 130, and 120 yards. Double and single Express rifles of ·303 bore with 26-inch barrels are also made. The rifle trial of 1883 arranged at Putney by J. H. Walsh ("Stonehenge"), then editor of the *Field*, originally established the excellence of the principle of these rifles; but they have since been improved in rifling and mechanism. The usual modern Express rifling is from five to seven shallow grooves, the grooves and bands being of equal width, with a twist suited to the length and diameter of the bullet.

The sights of sporting Express rifles are of some variety, and are usually designed and made with more care and accuracy than those of military rifles. The open V backsight on an ivory pyramid with two or three leaves up to 300 yards, and the enamelled bead foresight, are the most usual form. The more elaborate Lyman and Beech peepsights are also popular. Solid-drawn brass cartridge-cases are now always used for sporting rifles, except occasionally for some of the larger bores, in which paper cartridges may be used. The peculiarity of the Express bullet is its hollow point to ensure the expansion of the projectile on impact. This diminishes its penetration, but translates its velocity or energy into "shock." The size and shape of the hollow in the point vary according to the purpose required. If greater penetration is needed, the leaden bullet is hardened with mercury or tin, or the military nickel-coated bullet is used in the small-bore rifle. Explosive bullets filled with detonating powder were at one time used in Express and large-bore rifles for large game. The use of these bullets is now practically abandoned, owing to their uncertainty of action and the

[1] The term "point-blank range" is often used in this connexion. Strictly speaking, there is no such thing as "point-blank range," the bullet commencing to drop immediately it leaves the muzzle of the rifle. The path or trajectory of the bullet if fired horizontally is therefore always a downward curve. The higher the muzzle velocity the flatter is this curve. The "fixed-sight," or so-called "point-blank" range, is usually taken at such range and with such elevation as render the amount of drop of the bullet or curve of its path practically immaterial for sporting purposes, say a maximum of $4\frac{1}{2}$ inches. At shorter range this curve would therefore take the bullet so much above the line of fixed-sight aim, and must where necessary be allowed for.

danger in handling them. The use of the large four- and eight-bore rifle is restricted to the hunting of large and dangerous game. These are usually double-barrelled. The four-bore weighs from 14 to 18 lb with 20-inch barrels, and fires a charge of 12 to 14 drs. of powder, with a spherical bullet of 1510 grains. The great weight of this rifle is against its general use. The eight-bore rifle weighs from 11½ to 15 lb with 20- to 24-inch barrels, with a charge of 8 to 12 drs. of powder with a spherical ball. These rifles are accurate and effective up to 120 yards.

Rook and rabbit rifles are usually single-barrel breech-loading rifles of from ·220 to ·380 bore, hammerless, ejectors. The range is ordinarily restricted to 200 yards. The combination of a rifle and shot-gun is generally used in countries where the kind of game to be met with is not known beforehand, and by emigrants who can only afford one gun. The weapon is double-barrelled; the left usually rifled, and the right a smooth-bore. The proper proportions of bore are ·450 rifle barrel and sixteen-bore short barrel; or ·500 rifle and twelve-bore shot. This weapon has many drawbacks, being too heavy for a shot-gun and too light for a rifle, with a bad balance. More modern combinations of the rifle and shot-gun are Holland's "Paradox," a smooth-bore with the last three inches of the barrel ratchet-rifled; Lancaster's "Colindian" twisted oval bore without sharp-edged grooves or ridges in the barrel; and Bland's "Euoplia" with "invisible" undulating rifling, also without sharp-edged grooves or ridges. All these weapons fire heavy bullets more or less accurately up to 100 yards, are also used as shot-guns, and are made double or single barrelled and of various calibres, twelve-bore being the most common. The Morris tube is a small-bore rifle barrel capable of being inserted and used as required in a shot-gun or larger rifle. A shot-gun may thus be utilized as a small-bore rifle, or a large rifle as a saloon rifle for gallery practice.

The modern small-bore military rifle already described, such as the Lee-Enfield or the German Mauser or Austrian Mannlicher, now possesses all the best qualities of an Express sporting rifle—namely, accuracy, flat trajectory, high muzzle velocity, and long point-blank range up to 200 yards. This weapon is also a "long-range Express," and can be sighted up to 2800 yards. A sporting variety of the military weapon is now made, either double or single, ·256 to ·303 bore, the double-barrel with a very strong breech mechanism; the weight, as desired, beyond 8½ lb. The standard charge of black gunpowder is 71½ grains; of cordite, 30 grains; of "rifleite," 38 grains. The muzzle velocity of the ·303 bore with black powder is 1850 feet per second; with cordite, 2000 feet. This weapon is now one of the most efficient rifles for general game shooting. The hollow-pointed expanding bullet with soft lead nose is generally used in these rifles for ordinary sporting purposes, with the military solid metal cartridge-case. Some leading gunmakers make their latest single and double Express sporting rifles, firing nitro-powder cartridges, cordite, or rifleite, of from ·360 to ·577 bore, thus possessing the greater power and shock of the old eight-bore rifle firing black powder, combined with much of the handiness, long range, and flat trajectory of the smaller-bore smokeless Express rifle. The automatic principle, by which the firing of each cartridge loads the next and cocks the weapon, has not yet been applied to rifles, but is applied to some pistols and carbines, such as the Mauser. (H. S.-K.)

Riga, one of the chief seaports of Russia, at the head of the gulf of same name, in the government of Livonia. Its population, which was 180,935 in 1891, had increased to 281,884 in 1897, so that it now ranks sixth in the empire in order of population; 47 per cent. of the inhabitants are Germans, 25 per cent. Russians, and 23 per cent. Letts, with a small admixture of Esthonians, Jews, &c. The city has now a polytechnic, five gymnasia, several technical and theological middle schools, a pilot and navigation school, and a number of primary institutions, with about 20,000 pupils of both sexes. Industrial activity has also developed, and there are now 275 factories (mainly railway-carriage works, works for the manufacture of machinery, oil mills, and breweries), giving employment to 30,000 workmen, and showing yearly returns of 60,000,000 roubles. No less than 33 newspapers (18 in German) are published, and there are 43 public libraries. Having direct railway communication with all the fertile parts of southern and south-eastern Russia, Riga has become the second port for foreign trade on the Baltic, ranking next after St Petersburg. The chief exports are grain, flax, seed, eggs, butter, hemp, and timber, while the imports, which have rapidly increased, are chiefly colonial and manufactured goods. The port, which freezes on an average for 127 days every year, was visited in 1899 by 1236 ships, of which only 253 were under the Russian flag. The larger ships cannot reach Riga, and consequently are unloaded at Ust Dvinsk (formerly Dünaburg). By no means all the trade with the interior is commanded by the railways; no inconsiderable portion of the goods is carried by water. Every year about 28,000 tons are shipped to the town from the basin of the Dnieper, 50,000 tons from the basin of the Duna, and 89,000 tons from the other river basins —in all, 167,000 tons per annum.

Rimbaud, Jean Arthur (1854–1891), French poet and adventurer, was born at Charleville, in the Ardennes, on 20th October 1854, the second son of a captain in the French army, who in 1860 abandoned his wife and family. From early childhood Arthur Rimbaud, who was severely brought up by his mother, displayed rich intellectual gifts and a sullen, violent temperament. He began to write when he was ten, and some of the poems which now appear in his works belong to his fifteenth year. Before he was sixteen, in consequence of a violent quarrel with his mother, the boy escaped from Charleville with a packet of his verse, was arrested as a vagabond, and for a fortnight was locked up in the Mazas prison, Paris. A few days after being taken home, Rimbaud escaped again, into Belgium, where he lived for some time as a tramp, almost starved, but writing verses with feverish assiduity. A curious letter of this period exists, in which Rimbaud says that all recent French poetry, except certain pieces of Verlaine, absolutely "disgusts" him, and in which he announces his intention of creating a new thing in verse. In February 1871 he left his mother for a third time, and made his way to Paris, where he knew no one, and whence, after very nearly dying of hunger and exposure, he begged his way back to Charleville. There he wrote in the same year the extraordinary poem of *Le Bateau Ivre*, which is now hailed as the pioneer of the entire "symbolist" or "decadent" movement in French literature, in all its forms. He sent it to Verlaine, who encouraged the boy of seventeen (whom he supposed to be a man of thirty) to come again to Paris. Rimbaud spent from October 1871 to July 1872 in the capital, partly with Verlaine, partly as the guest of Théodore de Banville, and served in the army of the Commune. With Verlaine he travelled for thirteen months, after the fall of the Commune, through England and Belgium, where in 1873 he published the only work which he ever printed, *Une Saison en Enfer*, in prose; in

this he gives an allegorical account of his extravagant relations with Verlaine, which ended at Brussels by a double attempt of the latter to murder his young companion. On the second occasion Rimbaud was dangerously wounded by Verlaine's revolver, and the elder poet was imprisoned at Mons for two years. Meanwhile Rimbaud, deeply disillusioned, determined to abandon Europe and literature, and he ceased at the age of nineteen to write poetry. He settled for a while at Stuttgart, studying German, and in 1875 he disappeared. He set out on foot for Italy, and after extraordinary adventures found employment as a day-labourer in the docks at Leghorn. Returning to Paris, he obtained a little money from his mother, and then definitely vanished. For sixteen years nothing whatever was heard of him, but it is now known that he embarked as a Dutch soldier for the Sunda Isles, and presently deserting, fled to Sumatra and then to Java, where he lived for some time in the forest. Returning to Europe, after a vagabond life in every capital, he obtained in 1880 some menial employment in the quarries of Cyprus, and then worked his way to Aden and up into Abyssinia, where he was one of the pioneers of European commercial adventure. Here he settled, at Harrar, as a trader in coffee and perfumes, to which he afterwards added gold and ivory; for the next eleven years, during which he led many commercial expeditions into unknown parts of northern Africa, Shoa and Harrar were his headquarters, and he lived almost entirely with the natives, and as one of themselves. From 1888 to 1891, having prospered greatly as a merchant, he became a sort of semi-independent chieftain, intriguing for France, just outside the borders of civilization. From documents which were first produced in 1902, it appears that from 1883 to 1889 Rimbaud was in close relations with the Ras Makonnen and with Menelek, then only king of Shoa. At the death of the Negus John, in 1888, he was concerned in the formation of the empire of Ethiopia. From this time Rimbaud had a palace in the town of Harrar, and intrigued with the French Government in favour of Menelek and against Italy. Meanwhile, in 1886, believing Rimbaud to be dead, Verlaine had published his poems, under the title of *Les Illuminations*, and they had created a great sensation in Paris. But the author, in his Abyssinian hut of palm-leaves, was, and remained, quite unconscious of the fact. In March 1891 a tumour in his knee obliged Rimbaud to leave Harrar and go to Europe for surgical advice. He reached Marseilles, but the case was hopeless; the leg had to be amputated, and Rimbaud died there in hospital on the 10th of November 1891. The poems of Rimbaud all belong to his earliest youth. Their violent originality, the influence which they have exercised upon younger writers, the tumultuous existence of their author, and the strange veil of mystery which still hangs over his character and adventures, have given to Rimbaud a remarkable fascination. His life has been written by M. Paterne Berrichon (1898), and valuable reminiscences by his sister, Mlle Isabella Rimbaud. His *Œuvres* were collected in 1898 by MM. Berrichon and Delahaye, and in 1901 his statue was unveiled at Charleville. (E. G.)

Rimini, a town and bishop's see of the province of Forlì, Emilia, Italy, on the Adriatic coast, 69 miles south-east of Bologna by rail. Among the buildings may be mentioned an archæological museum, a bronze statue of Pope Paul V., and a technical school (1882). Rimini attracts numerous visitors for the sea-bathing it offers at Porta Marina; it also has mineral springs. Various industries are carried on—ironworks and foundries, sulphur furnaces, silk-mills, rope-walks, match factories, brick-works, flour-mills, and furniture shops. Population (1881), 19,158; (1899), about 21,000.

Riobamba, or RIOBAMBA NUOVA, chief town of the province of Chimborazo, Ecuador, Central America, situated on a high plateau, on the San Juan river, an affluent of the Chambo, 100 miles south-south-west of Quito, and 22 north-west of Chimborazo. It has manufactures of woollens and sacking. The plain to the south was the scene of a great battle with the Indians during the conquest, and in the vicinity are remains of an Inca palace. Population, 12,000.

Rio de Janeiro, capital and principal commercial centre of Brazil. The principal part covers an area of about two square kilometres, bounded on the S. by the Morros Castello and S. Antonio, and on the N. by S. Bento and Conceiçao. This section is divided into regular squares by narrow streets; in the principal ones are tramway lines, some horse lines, others electric. The length of these lines in the city limits is about 177 miles. The city has been spreading along the shores of the bay to the north and far back over the hills behind it, so that it now extends over a distance of 18 miles. The number of the buildings is estimated at 50,000. The former imperial palace of Boa Vista is now the National Museum. The present Government Palace is in the populous district of Cattele. Rio is one of the most unhealthy and, until almost the end of the 19th century, one of the most insanitary cities of Brazil, yellow fever being endemic. Tuberculosis and smallpox also make constant ravages. The mortality in 1896 was: pernicious abscesses, 766; yellow fever, 2919; other fevers, 1403; smallpox, 258; other diseases, 14,144. In 1898 the number of cases of yellow fever in Rio was 1177, deaths 1094; and of smallpox, 204, deaths 66. In 1899 there were 928 cases of yellow fever, and 720 deaths; in 1900 there were 2726 deaths from tuberculosis, 631 from smallpox, 344 from yellow fever, and 292 from bubonic plague, which made its first appearance there that year. Rio de Janeiro constitutes a separate political and administrative division, called the Federal District. It is governed by a mayor appointed by the president of the Republic, and has a municipal council elected by the people. The district is divided into 20 urban circumscriptions and 8 suburban ones. In 1890 the population of the Federal district was 674,972, and for 1900 was reported as 779,000. The receipts of the Federal District for 1898 were estimated at 17,656,436 milreis, and the expenditure at 15,826,270. Rio is the principal port of shipment in Brazil for coffee: in 1896, 2,784,958 bags (60 kil.) were exported; in 1897, 4,066,734 bags; in 1898, 3,441,166 bags; in 1899, 3,504,708 bags; and in 1900, 2,658,990 bags. The average value in 1898 was about 31s. 6d. per bag. The total exports of all kinds were valued at £6,750,000 in 1900, of which £5,670,000 was for coffee, £482,000 for gold, £151,000 for manganese, and £149,000 for hides. The principal imports are wheat, flour, coal, wines, cottons and textiles, machinery, &c. But the import trade has declined: £12,631,000 in 1898; £11,468,000 in 1899; £9,462,000 in 1900. The greater part of the immigration to Brazil passes through the port; in 1896 there were 100,547 immigrants; and in 1898–99, 27,650 were reported landed at Rio. The movement of all shipping engaged in foreign trade during the years 1896, 1897, 1898, 1899, and 1900 was: entered in 1896, 1535 vessels, of 2,469,628 tons; cleared, 1404 vessels, of 2,283,499 tons: entered in 1897, 1274 vessels, of 2,146,854 tons; cleared, 1220 vessels, of 2,044,858 tons; in 1898, 1218 vessels, of 2,069,161 tons, entered, and 1130 vessels, of 1,957,712 tons, cleared; in 1899, 1077 vessels, of 1,916,936 tons,

entered, and 1019 vessels, of 1,853,707 tons, cleared; in 1900, 843 vessels, of 1,522,754 tons, entered, and 790 vessels, of 1,407,122 tons, cleared. In the above the entries of British shipping in 1898 were 552 vessels, of 1,030,149 tons; in 1899, 482 vessels of 936,393 tons; and in 1900, 385 vessels of 791,250 tons.

Rio de Janeiro, an Atlantic state of Brazil, between 20° 50′ and 23° 19′ S. and 41° 01′ and 44° 52′ W. Area, 26,634 square miles. Population in 1890, 1,227,575 (exclusive of the city of Rio de Janeiro, which constitutes the Neutral Federal District or Distrito Federal). It is bounded on the N. by Minas Geraes, on the W. by São Paulo, on the S. and E. by the Atlantic. The capital, Nictheroy, on the Bay of Guanabara (or Rio), has 36,000 inhabitants. Amongst other towns may be named Rio Bonito (21,000), Campos (20,000), Itaborahy (18,200), Barra Mansa (12,200), Parahyba do Sul, Paraty, Pirahy, Rezende (16,000), S. Fidelis (14,500), Petropolis (12,200), Cabo Trio, Valenza, Carmo, Marica. The state is well supplied with railways. The principal agricultural product is coffee, the exports in 1900 amounting to 87,105,716 kilograms.

Rio de Oro, a Spanish colony on the north-west coast of Africa. It is situated about the middle of that part of the Sahara coast which Spain considers her own by right of occupation and exploration, between 23° 35′ and 23° 55′ N. The peninsula of Rio de Oro is united to the mainland by a sandy isthmus, and its length is 23 miles, and its breadth 1¼ to 2 miles, on an average about 20 feet above the sea-level. The bay between peninsula and mainland is 22 miles long, 5 broad, navigable over two-thirds of its extent, and with good anchorage in most of the channel, but the bar at its mouth is not always easy to pass in rough weather. The peninsula has very sparse vegetation, except in its southernmost part near Cape Durnford. There is an island in the bay, Isla Herne.

The climate is generally temperate, and not unhealthy except in the autumn. Esparto grass and manzanilla are grown in many places, but European plants are not easily acclimatized. On the peninsula and on the coast itself there are many hares, wolves, foxes, hyenas, gazelles, lizards, pelicans, and large crows. The natives of the coast are Arab tribes, a cross of Berbers and negroes, Mussulmans, very poorly clad, who rear cattle, sheep, camels, and have but few horses. They are very suspicious and treacherous in their intercourse with the Spaniards.

In 1884 the Hispano-African Company built a factory 7 miles from Cape Durnford, but in the following year it was pillaged and burnt by the natives. The Hispano-African Company for a while renewed its trade with the natives, but finally ceded its rights to the Transatlantic Company of Barcelona. War vessels from the Canary Isles visit Rio de Oro several times in the year, to carry reliefs, provisions, and war stores.

The best works of reference on Rio de Oro are those of Bonelli, who founded the *Nation* in 1884, the articles of Francisco Quiroga and Costa and Lorenzo Rubio in vols. i. and ii. of the *Revista de Geographia*. Costa thinks Rio de Oro is the Ciranis of Herodotus.

Rio Grande, one of the longest and most eccentric of the North American rivers. It is nearly 1800 miles from its source, in the Rocky Mountains of southern Colorado, to its mouth, on the Gulf of Mexico. Although navigable only in its lower 100 miles, normally without running water for vast stretches, and extending for almost its entire course through deserts, it has had a dominating influence over the cultural and political conditions of the vast country which it threads. For nearly 1000 miles it forms the natural and political boundary between the United States and Mexico. Below El Paso and along the Lower Rio Grande the course often shifts, thereby causing international complications. Historically the Rio Grande is interesting from its connexion with the early Spanish explorations of the 16th century. It presents many features of a complex physiographic type, being in portions a river of the Rocky Mountains, of the interior deserts, and of the Atlantic Coastal Plain. It also presents a complicated geological history, including the union of what were originally several streams. The different parts were given three distinct names by the Mexican inhabitants. The upper stretch, of some 500 miles, flowing southward from Colorado through New Mexico into Texas, was called the Rio del Norte. Except a small portion of the head-waters, this section is an intermittent stream, flowing sluggishly through the interior deserts of the Cordilleran region. Its bed above and below El Paso is at times dry. In May and June the sun melts the accumulated winter snows of the Colorado Rockies and floods the dry bed, the water from which the inhabitants turn upon their fields. A few miles below Presidio del Norte, Texas, the river enters a series of vast cañons cutting across range after range of the eastern line of the American Cordilleras, seeking an outlet from the basin deserts to the Atlantic coastal plain. This stretch, extending to the mouth of Devil's river, is 400 miles long, and is known as the Rio Bravo. In this portion of its course the river makes an angle, changing its course from south-west to north-east, and is popularly known as the Big Bend. Just above Del Rio the Rio Bravo emerges upon the broad coastal plain of the Gulf of Mexico. It now becomes the Rio Grande.

The Rio Grande, as a whole, attracts almost no lateral drainage except in the upper 300 miles of its course. In passing through the greater part of New Mexico and Texas it is constantly fed only by the Conchas and Pecos, which bring their permanent waters from distant countries. Its flow is continuous from its source to about the 35th parallel in New Mexico; thence to Presidio, Texas, it is interrupted. In this stretch the run-off aggregates far more than that of all the other portions combined. Even this normal run-off progressively decreases down stream (three years' observations) from 11·63 second feet at Del Norte, Colorado, to ·64 second feet at San Marcial, 500 miles below El Paso. At Presidio the flow first becomes continuous and copious, through the accession of the waters of the Conchas river of Chihuahua. In the Big Bend its volume is enhanced by copious subterranean springs breaking forth in its bed. The inflow of the Pecos largely increases the volume of the Lower Rio Grande. From below the mouth of the Pecos the river has no large contributing laterals. Below Presidio there are two seasons of overflow—in May or June, from the melting of the snows, and in August, from the tropical rains near the sources of the Conchas in Mexico. Although the United States Government has made many observations upon the flow of the Upper Rio Grande north of El Paso, none is recorded of the stream below that point. Of the two flowing tributaries, the Rio Grande and the Pecos, either might be considered the mother stream or head-water continuation of the Lower Rio Grande, as much as the Rio del Norte, now so considered. The Rio Conchas rises in the mountains of Chihuahua and flows almost due northward into the Rio Grande. The Pecos is almost equal to the Upper Rio Grande in length, and, so far as constant volume is concerned, a larger stream. Like the Rio Grande, it receives its waters from the ranges of the Rocky Mountains in northern New Mexico. It is also reinforced by numerous streams from the Sacramento Mountains. (R. T. H.)

Rio Grande do Norte, an Atlantic state of Brazil, the extreme eastern part of the republic, with Cape St Roque as its most easterly port, situated between 4° 54′ and 6° 28′ S. and 34° 52′ and 37° 48′ W. Area, 22,195 square miles. Population in 1872, 233,979; and in 1890, 313,979. It is bounded on the N. by the state of Ceará and the Atlantic Ocean, on the W. by Ceará, on the S. by Parahyba, and on the E. by the Atlantic. The capital, Natal, which is also the principal port of the state, has a population of 46,000, Mossoro has 3000, Ceará-Mirim 4000, and Macao 5000.

Rio Grande do Sul, or São Pedro do Rio Grande do Sul, a state of Brazil between 27° 05′ and 33° 45′ S. and 49° 32′ and 57° 20′ W. Area, 91,335 square miles. Population in 1872, 434,816; in 1890, 880,878; and in 1900, 968,231. It is bounded on the N. by S. Catharina, on the W. by the Argentine Republic

and Uruguay, on the E. by the Atlantic, and on the S. by Uruguay. The capital, Porto Alegre, has a population of nearly 100,000, of whom 10,000 are Germans. Between 1886 and 1894, 75,766 immigrants entered the state, principally Germans, Italians, and Poles. Other towns include Pelotas (30,000), Alegrete (12,000), Jaguarão (8000), Rio Grande, Bagé, Caçapava, Rio Pardo, S. José do Norte. There are 670 miles of railway in operation, and other lines are in process of construction. There are numerous prosperous German colonies, and their number and importance are constantly increasing. The oldest, S. Leopoldo, was founded in 1824.

Rioja, La, a province in the west of the Argentine Republic, bounded on the N. by Catamarca, on the E. by Catamarca and Cordoba, on the S. by San Luis, and on the W. by San Juan and Chile. Official area at the census of 1895, 34,546 square miles. Population in 1895, 69,502. The capital, La Rioja, had a population in 1895 of 5931. The gold, silver, and copper mines near Famatina and Chilecito constitute the principal sources of wealth of the province. The province is divided into eighteen departments. In 1895 there were 6446 farms, and 40,920 acres planted in cereals.

Rio Negro, a territory of the Argentine Republic, bounded on the N. by the territory of Pampa, from which it is separated by the Rio Colorado, on the S. by Chubut, on the E. by the Atlantic, and on the W. by Neuquen and Chile. Official area at the census of 1895, 75,924 square miles; population, 9241. The capital is Viedma, on the right bank of the Rio Negro, 20 miles from its mouth. The territory is divided into seven departments. In 1895 there were 82,050 head of cattle, 1,009,777 head of sheep, and 35,599 horses in the territory, and only 1168 acres planted in cereals.

Riot.—The criminal law as to riot has not been modified since 1885, but the materials for ascertaining the duties of justices, the police, ordinary citizens, and soldiers, with respect to the suppression of riots have been increased by the publication in the New Series of State Trials of the full reports of the prosecution of the mayor of Bristol for dereliction of duty in suppressing the Bristol riots of 1831, and a number of other leading cases on riot; and Lord Bowen and his fellow-commissioners in the report on the Featherstone riots (Parl. Paper, 1893–94, c. 7234) have dealt with the duty of soldiers called in to suppress riots. The substance of their views is as follows:—

By the law of England every one is bound to aid in the suppression of riotous assemblages. The degree of force, however, which may be lawfully employed in their suppression depends on the nature of each riot, for the force used must always be moderated and proportioned to the circumstances of the case and to the end to be attained. The taking of life can only be justified by the necessity for protecting persons or property against various forms of violent crime, or by the necessity of dispersing a riotous crowd which is dangerous unless dispersed, or in the case of persons whose conduct has become felonious through disobedience to the provisions of the Riot Act, and who resist the attempt to disperse or apprehend them. The necessary prevention of such outrage on person or property justifies the guardians of the peace in the employment against a crowd of even deadly weapons. Officers and soldiers are under no special privileges and subject to no special responsibilities as regards the principle of the law. A soldier for the purpose of establishing civil order is only a citizen armed in a particular manner. He cannot because he is a soldier be exonerated if without necessity he takes human life. The duty of magistrates and peace officers to summon or abstain from summoning the assistance of the military depends in like manner on the necessities of the case. A soldier can act only by using his arms. The weapons he carries are deadly. They cannot be employed at all without danger to life or limb, and in these days of improved rifles and perfected ammunition without some risk of danger to distant and possibly innocent bystanders. To call for assistance against rioters from those who can interfere only under such grave conditions ought, of course, to be the last expedient of the civil authorities. But when the call for help is made and a necessity for assistance from the military has arisen, to refuse such assistance is in law a misdemeanour. The whole action of the military when once called in ought from first to last to be based on the principle of doing, and doing without fear, that which is absolutely necessary to prevent serious crime, and of exercising care and skill with regard to what is done. No set of rules exists which governs every instance or defines beforehand any contingency that may arise. The presence of a magistrate is not essential, but is usual, and of the highest value to aid the commander of the troops by local knowledge. But his presence or absence has no legal effect on the duties or responsibilities of the military to use their arms when it becomes necessary to do so, and without recklessness or negligence and with reasonable care and caution; and where they have so acted the killing of a rioter is justifiable homicide, and the killing of an innocent bystander is homicide by misadventure. It is not usual to resort to extremities with rioters until after reading the proclamation under 1 Geo. I.; but this preliminary is by no means a condition precedent to the exercise of the common-law powers of suppressing riots.

The Crown cannot charge upon the local rates the expense of maintaining soldiers called into a district by the magistrates to suppress riots (*R.* v. *Glamorgan County Council*, L.R. 1899, 2 Q.B. 536), but the cost of extra police called in for the like purpose falls on the local rates. The old exceptional civil remedy against the inhabitants of a hundred in which damage to private property was done by rioters was abolished in 1886. When the Piccadilly riots occurred in that year no one knew that the injured shops were in the hundred of Ossulston, and difficulties arose in applying the old procedure. So a statute was passed (49 Vict. c. 11) for a special settlement of the claims, and the old statutes were repealed and replaced by the Riot Damage Act, 1886. Under this Act compensation is payable where rioters have injured or destroyed houses, shops, buildings, fixed or movable machinery, and appliances prepared or used for or in connexion with manufactures or agriculture, or for mines or quarries, or vessels stranded or in distress (see WRECK), or have injured, stolen, or destroyed property in houses, shops, or buildings. The compensation is payable out of the police rate for the district in which the damage is done; or if it was done afloat, for the district nearest to the scene of action. The claim is made on the police authority for the district. The time and form for making claims and the mode of fixing the amount of compensation is regulated by rules made by the Home Secretary on 30th June 1894 (Stat. R. and O. 1894, No. 636). In adjusting the amount regard is had to the conduct of the claimant, viz., as to precautions taken by him, his share, if any, in the riot, or provocation offered to the rioters. Failure to carry out a programme for athletic sports has been held to debar a claimant for damage done by a riot among the disappointed spectators who had paid to see the sports. The claimant must give credit for insurance money, or any other compensation received in respect of the damage; but the insurers or persons who paid such compensation may file a claim against the police-rate for the amount paid by them. Persons dissatisfied with the award of the police authority may sue for the recovery of their claim subject to a liability to pay all the costs if they do not get judgment for more than the amount awarded. The action, if it is not for more than £100, is to be brought in the county court. In Scotland there is also a civil remedy against the county or borough in which a riot takes place in respect of damage done by the rioters to houses, churches, buildings, and ships, and buildings or engines used in trade or manufacture. The remedy is given by a series of statutes: 1 Geo. I. st. 2, c. 5, § 9; 52 Geo. III. c. 130, §§ 3, 4; 56 Geo. III. c. 125, § 2; 57 Geo. III. c. 19, § 38, and 57 and 58 Vict. c. 60, § 515. The procedure for its enforcement is now regulated by 3 Geo. IV. c. 33, and amending statutes. The county or borough authorities may adjust claims without litigation, and pay them out of the general assessments. In Ireland the civil remedy against the county or borough

for malicious injury to property, real or personal, including ships in distress and their cargo, is wider than in England or Scotland, but it includes malicious injury by rioters where the injury is a crime within the Malicious Damage Act of 1861. Claims are now dealt with in the civil bill court, and not as formerly by the grand jury and judge of assize (61 and 62 Vict. c. 37, § 5). (W. F. C.)

Ripon, George Frederick Samuel Robinson, 1st Marquis of (1827——), British statesman, only son of the 1st earl of Ripon and his wife Lady Sarah, daughter of the 4th earl of Buckinghamshire, was born in London, 24th October 1827. He began his political life as *attaché* to a special mission to Brussels in 1849. Under his courtesy title of Viscount Goderich he was returned to the House of Commons for Hull in 1852 as an advanced Liberal. In 1853 he was elected for Huddersfield, and in 1857 for the West Riding of Yorkshire. In January 1859 he succeeded to his father's title, and in November of the same year to that of his uncle, Earl de Grey. A few months after entering the Upper House he was appointed under-secretary for war, and in February 1861 under-secretary for India. Upon the death of Sir George Cornewall Lewis in April 1863, he became secretary for war, with a seat in the Cabinet. In 1866 he was appointed secretary of state for India. On the advent of the Gladstone Administration in December 1868, Lord Ripon was appointed lord president of the Council, and held that office until within a few months of the fall of the Government in 1873, when he resigned on purely private grounds. In 1869 he was created a Knight of the Garter. In 1871 Lord Ripon was appointed chairman of the High Joint-Commission on the *Alabama* claims, which arranged the Treaty of Washington. In recognition of his services he was elevated to a marquisate. In 1874 he became a convert to Roman Catholicism, and this involved his resignation of the office of grand master of the English Freemasons. On the return of Mr Gladstone to power in 1880 Lord Ripon was appointed Viceroy of India, the appointment exciting a storm of controversy, meetings of protest being held in Exeter Hall and elsewhere, the marquis being the first Roman Catholic to hold the viceregal office. An account of his viceroyalty will be found in the article India: *History*. The new Viceroy was called upon to decide grave questions between the native population and the resident British, and he resolved upon a liberal policy towards the former. He extended the rights of the natives, and in certain directions curtailed the privileges of Europeans. Several of the Viceroy's measures, notably the Ilbert Bill of 1883—the object of which was to subject Europeans to trial by native magistrates in certain cases—irritated the Anglo-Indian population, and the measure was fiercely assailed. There probably never was a Viceroy so unpopular among Anglo-Indians or so popular with the natives. On Lord Ripon's departure from India in November 1884 there were extraordinary manifestations in his favour on the part of the Hindoo population of Bengal and Bombay, and more than a thousand addresses were presented to him. On his arrival in England the marquis delivered a number of vigorous speeches in defence of his administration. In 1886 he became first lord of the Admiralty in the third Gladstone Ministry; and on the return of the Liberals to power in 1892, he was appointed Colonial Secretary, which post he continued to hold until the resignation of the Government in 1895. For many years Lord Ripon was president of the Yorkshire College of Science at Leeds, and chairman of the West Riding County Council.

Ripon, a cathedral city and municipal borough, Yorkshire, England, West Riding, in the Ripon parliamentary division, 22 miles north-west of York by rail. A new cemetery, completed in 1894, has one chapel available for all denominations. In the same year new premises were erected for the Mechanics' Institution, in which a continuation evening school and technical classes are held. A clock tower was presented as a memorial of Queen Victoria's Diamond Jubilee, and a church institute was erected in 1900. There is a somewhat extensive trade in varnish, and its manufactures of saddle-trees, leather, &c., are in high repute. Population of the municipal borough (1881), 7390; (1891) (altered area), 7826; (1901), 8225.

Riposto, a seaport town of the province of Catania, Sicily, Italy, 19 miles north by east of Catania, on the east coast railway to Messina. It is one of the principal wine-exporting places in the island. In 1897 the port was cleared by 758 vessels of 365,116 tons. It has several cooperages. Population (1899), about 9000.

Ristitch, Jovan (1831–1899), Servian statesman, was born at Kragujevats in 1831. He was educated at Belgrade, Heidelberg, Berlin, and Paris. After failing to obtain a professorship in the High School of Belgrade, he was appointed in 1861 Servian diplomatic agent at Constantinople. His reputation was enhanced by the series of negotiations which ended in the withdrawal of the Turkish troops from the Servian fortresses in 1867. On his return from Constantinople he was offered a ministerial post by Prince Michael, who described him as "his right arm," but declined office, being opposed to the reactionary methods adopted by the Prince's Government. He had already become the recognized leader of the Liberal party. After the assassination of Prince Michael in 1868, he was nominated member of the Council of Regency, and on the 2nd January 1869 the first Servian Constitution, which was mainly his creation, was promulgated. When Prince Milan attained his majority in 1872, Ristitch became foreign minister; a few months later he was appointed prime minister, but resigned in the following autumn (1893). He again became prime minister in April 1876, and conducted the two wars against Turkey (July 1876–March 1877 and December 1877–March 1878). At the Congress of Berlin he laboured with some success to obtain greater advantages for Servia than had been accorded to her by the treaty of San Stefano. The provisions of the Treaty of Berlin, however, disappointed the Servians, owing to the obstacles now raised to the realization of the national programme; the Ristitch Government became unpopular, and resigned in 1880. In 1887 King Milan (who had assumed the royal title in 1882), alarmed at the threatening attitude of the Radical party, recalled Ristitch to power at the head of a coalition cabinet; a new Constitution was granted in 1888, and in the following year the king abdicated in favour of his son, Prince Alexander. Ristitch now became head of a Council of Regency, entrusted with power during the minority of the young king, and a Radical ministry was formed. In 1892, however, Ristitch transferred the government to the Liberal party, with which he had always been connected. This step and the subsequent conduct of the Liberal politicians caused serious discontent in the country. On the 1st (13th) April 1893 King Alexander, by a successful stratagem, imprisoned the regents and ministers in the palace, and, declaring himself of age, recalled the Radicals to office. Ristitch now retired into private life. He died at Belgrade on 4th September 1899. Though cautious and deliberate by temperament, he was a man of strong will and firm character. He was the author of two published works: *The External Relations*

of Servia from 1848 to 1867 (Belgrade, 1887) and *A Diplomatic History of Servia* (Belgrade, 1896). (J. D. B.)

Ritschl, Albrecht (1822–1889), German theologian, was born at Breslau, 21st March 1822. He studied at Bonn and at Halle. At the latter place he came under Hegelian influences through the teaching of Schaller and Erdmann. In 1845 he was entirely captivated by the Tubingen school. This did not last long with him, however, for his most important work on the *Origin of the Old Catholic Church* shows in its second edition (1857) entire emancipation from Baur's method. He was professor of theology at Bonn and Göttingen, his *Addresses on Religion* delivered at the latter university showing the impression made upon his mind by his enthusiastic studies of Kant and Schleiermacher. Finally, in 1864 came the influence of Lotze. He wrote a large work, *Rechtfertigung und Versöhnung* ("Justification and Reconciliation"), published during the years 1870–74, and in 1880–86 a *History of Pietism*. His system of theology is contained in the former. He died at Göttingen 28th March 1889.

Ritschl claims to carry on the work of Luther and Schleiermacher, especially in ridding faith of the tyranny of scholastic philosophy. His system shows the influence of Kant's destructive criticism of the claims of Pure Reason, recognition of the value of morally conditioned knowledge, and doctrine of the kingdom of ends; of Schleiermacher's historical treatment of Christianity, regulative use of the idea of religious fellowship, emphasis on the importance of religious feeling; and of Lotze's theory of knowledge and treatment of personality. Ritschl's work made a profound impression on German thought and gave a new confidence to German theology, while at the same time it provoked a storm of hostile criticism: his school has grown with remarkable rapidity. This is perhaps mainly due to the bold religious positivism with which he assumes that spiritual experience is real and that faith has not only a legitimate but even a paramount claim to provide the highest interpretation of the world. The life of trust in God is a fact, not so much to be explained as to explain everything else. No "theoretic" knowledge can exhaust its meaning: none can assail it. It is the highest and richest experience of man: there is no alternative but to take it as the fixed point from which all else is to be regarded. But Ritschl's standpoint is not that of the individual subject. The objective ground on which he bases his system is the religious experience of the Christian community. He starts from the point of view of a member of that believing society which refers its existence to the historical revelation of Jesus Christ, Founder and Redeemer. The "immediate object of theological knowledge is the faith of the community," and from this positive religious datum theology constructs a "total view of the world and human life." Thus the essence of Ritschl's work is systematic theology. He does not attempt to prove his data, but accepts their reality as if they were matter for natural science. Nor does he painfully work up to his master-category, for it is given in the knowledge of Jesus Christ revealed to the community. That God is love and that the purpose of His love is the moral organization of humanity in the "Kingdom of God"—this idea, with its immense range of application—is implied in Ritschl's initial datum.

From this vantage-ground Ritschl criticizes the use of Aristotelianism and speculative philosophy in scholastic and Protestant theology. He holds that such philosophy is too shallow for theology. Hegelianism attempts to squeeze all life into the categories of logic: Aristotelianism deals with "things in general" and ignores the radical distinction between nature and spirit. Neither of them is "vital" enough to sound the depths of religious life. Neither conceives "God" as correlative to human "trust" (cf. *Theologie und Metaphysik*, esp. p. 8 f.). But Ritschl's recoil carries him so far that he is left alone with merely "practical" experience. "Faith" knows God in His active relation to the "kingdom," but not at all as "self-existent."

His limitation of theological knowledge to the bounds of human need might, if logically pressed, run perilously near phenomenalism; and his epistemology ("we only know things *in* their activities") does not cover this weakness. In seeking ultimate reality in the circle of "active conscious sensation," he rules out all "metaphysic." Indeed, much that is part of normal Christian faith—*e.g.*, the Eternity of the Son—is passed over as beyond the range of his method. Ritschl's theory of "value-judgments" (*Werthurtheile*) illustrates this form of agnosticism. Religious judgments of value determine objects according to their bearing on our moral and spiritual welfare. They imply a lively sense of radical human need. This sort of knowledge stands quite apart from that produced by "theoretic" and "disinterested" judgments. The former moves in a world of "values," and judges things as they are related to our "fundamental self-feeling." The latter moves in a world of cause and effect. (*N.B.* Ritschl appears to confine Metaphysic to the category of Causality.) If this only meant that value-judgments are necessary for determining the relative value of given objects—*e.g.*, that, supposing the historical work of Christ to be a fact, we must be conscious of the need of redemption before we can appreciate the meaning of that work—then Ritschl's theory would be a welcome reassertion of an old but neglected truth. But the theory as formulated has such grave ambiguities, that his theology, which, as we have seen, is wholly based on uncompromising religious realism, has actually been charged with individualistic subjectivism. If Ritschl had clearly shown that judgments of value enfold and transform other types of knowledge, just as the "spiritual man" includes and transfigures but does not annihilate the "natural man," then within the compass of this spiritually-conditioned knowledge all other knowledge would be seen to have a function and a home. The theory of value-judgments is part too of his ultra-practical tendency: both "metaphysic" and "mysticism" are ruthlessly condemned. Faith-knowledge appears to be wrenched from its bearings and suspended in mid-ocean. Ritschl has no catholic medium in which spiritual and theoretic truths can be reconciled and harmonized. Perhaps if he had lived to see the progress of will-psychology he might have welcomed the hope of a more spiritual philosophy.

A few instances will illustrate (1) Ritschl's positive systematic theology, which takes for granted the data of Christian experience in the community and of historical revelation, working them up by the thoroughgoing teleological application of the conception of the Kingdom of God; (2) his repudiation of all "metaphysic"; (3) his elimination from faith of all that does not seem to bear on practical needs. The conception of God as Father is given to the community in Revelation. He must be regarded in His active relationship to the "kingdom," as spiritual personality revealed in spiritual purposiveness. His "Love" is His will as directed towards the realization of His purpose in the kingdom. His "Righteousness" is His fidelity to this purpose. With God as "First Cause" or "Moral Legislator" theology has no concern; nor is it interested in the "speculative" problems indicated by the traditional doctrine of the Trinity. "Natural theology" has no value save where it leans on faith. Again, Christ has for the religious life of the community the unique value of Founder and Redeemer. He is the perfect Revelation of God and the Exemplar of true religion. His work in founding the kingdom was a personal vocation, the spirit of which He communicates to believers, "thus, as exalted king," sustaining the life of His kingdom. His Resurrection is a necessary part of Christian belief (Ecke, pp. 198–199). "Divinity" is a predicate applied by faith to Jesus in His founding and redeeming activity. We note here that though Ritschl gives Jesus a unique and unapproachable position in His active relation to the kingdom, he declines to rise above this relative teaching. The "Two Nature" problem and the eternal relation of the Son to the Father have no bearing on experience, and therefore stand outside the range of theology.

Once more, in the doctrine of sin and redemption, the governing idea is God's fatherly purpose for His family. Sin is the contradiction of that purpose, and guilt is alienation from the family. Redemption, justification, regeneration, adoption, forgiveness, reconciliation all mean the same thing—the restoration of the broken family relationship. All depends on the Mediation of Christ, who maintained the filial relationship even to His death, and communicates it to the brotherhood of believers. Everything is defined by the idea of the family. The whole apparatus of "forensic" ideas (law, punishment, satisfaction, &c.) is summarily rejected as foreign to God's purpose of love. Ritschl is so faithful to the standpoint of the religious community, that he has nothing definite to say on many inevitable questions, such as the relation of God to pagan races. His school, in which Herrman, Kaftan, Harnack are the chief names, diverges from his teaching in many directions; *e.g.*, Kaftan appreciates the mystical side of religion, Harnack's criticism is very different from Ritschl's arbitrary

exegesis. They are united on the value of faith-knowledge as opposed to "metaphysic."

LITERATURE.—A. RITSCHL, *Die Christliche Lehre von der Rechtfertigung und Versöhnung*, 3rd edition, 1889; *Unterricht in der Christlichen Lehre* (very many editions); and *Theologie und Metaphysik*, 2nd edition, 1887, give his main position. Many historical and other works besides.—G. ECKE, *Die theologische Schule A. Ritschl's und die evangelische Kirche der Gegenwart*, 1897.—JAMES ORR, *The Ritschlian Theology and the Evangelical Faith*, 1898, London; and A. E. GARVIE, *The Ritschlian Theology*, 1899, Edinburgh, in both of which the bibliography of the movement is given. The German literature on the subject is very large. (G. E. N.)

Riukiu. See LUCHU.

Riva, a fortified district town near the Italian frontier in Tirol, Austria. It is a lake port and steamship station at the northern extremity of the Lago di Garda. There are two forts on the Monte Brione a little over a mile north-east of the town, and the old castle of La Rocca was reconstructed and extended in accordance with modern requirements in 1850. The Minorite Church (1603), with altar pictures by Guido Reni and other Italian painters, is much frequented as a place of pilgrimage. In addition to its transit trade and the entertainment of visitors, the principal resources of the town are the manufacture of paper, iron wares, and pottery, the cultivation of the silk-worm and the olive tree, and a considerable commerce in timber, planks, and coal. Riva is connected with the Ledro valley by a picturesque road, which passes in a series of tunnels and galleries along the rocky and precipitous west shore of the lake. Population (1890), 6480; (1900), 7550.

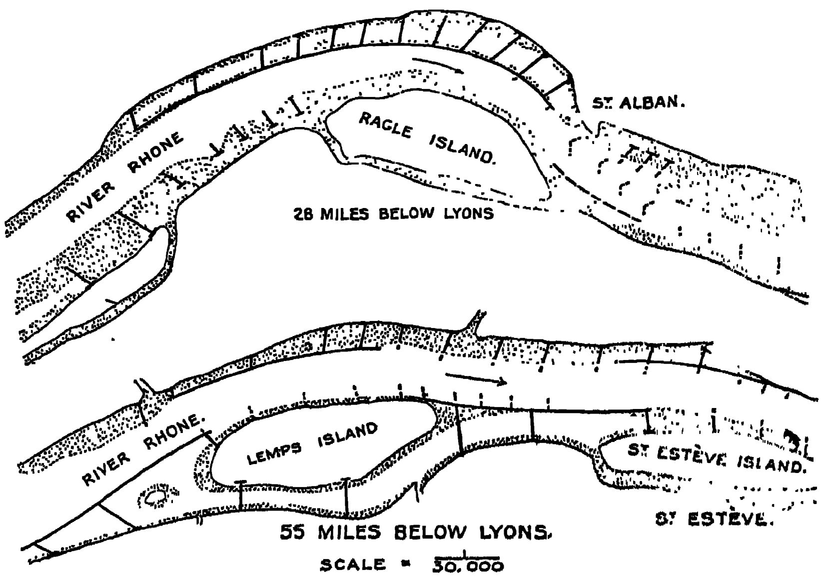
Rivarolo, a town of the province of Turin, Piedmont, Italy, in the Orco valley, 25 miles north of Turin by rail. It is a seat of cotton manufacture, and bicycles are also made and cocoons produced. The town stands picturesquely, and is sometimes called "Little Turin." Population (1899), about 7000.

River Engineering.—Since the article in the *Encyclopædia Britannica* on RIVER ENGINEERING[1] was written in 1884, several interesting works have been carried out or completed, exhibiting distinct progress in the improvement of rivers, and in some instances constituting novel undertakings; while some matters relating to the natural condition of rivers and their improvement, not included in the original article, require to be considered, in order to complete the review of the subject.

Improvement above the Tidal Limit.

When large rivers with a fairly good and regular flow at their low stage need only a moderate increase in depth at certain places to afford the requisite waterway for local inland navigation, the necessary improvement can often be effected by contracting the low-water channel with longitudinal and cross dykes, thereby promoting scour and increasing the depth. Of this the Rhine, the Rhône, the Elbe, the Niemen, and some rivers in North America furnish examples. These works leave the capacity of the river for discharging floods unaffected, or sometimes slightly improved, for the increase of the discharge in the deepened channel fully compensates for any obstruction the dykes may offer in the outer flood-channel. In rivers, also, which, with a rapid flow and inadequate depth, bring down so much detritus in flood-time as to preclude their improvement by canalization, the systematic regulation of the bed and banks has to be undertaken to increase the navigable depth.

The Rhône below Lyons, which has an average fall of 1 in 2080 and a maximum fall in some places of 1 in 250, and brings down large quantities of shingle and gravel, is a notable instance of the latter class of rivers, whose navigable depth at a low stage has been increased to a moderate extent by regulation works. These works, carried out between Lyons and the St Louis Canal close to the mouth of the river, a distance of 201 miles, were commenced in 1878, considerably modified after 1884, and completed for the most part by 1894, when consolidation works chiefly remained to be gradually executed. The expenditure at that period reached about £1,463,000 for the regulation works alone, or £7276 per mile, which may eventually be raised to £8000 per mile by the time the works are completely finished.[2] The works consist of (1) dykes across secondary and old channels, to close them and prevent their reopening during floods, when the main channel formerly tended to wander, and to concentrate the low-water flow in a single fixed channel (Fig. 2); (2) longitudinal



FIGS. 1 and 2.—Regulation Works, River Rhône.

dykes for protecting and easing the concave curves of the banks in the bends, which, being extended somewhat into the channel to reduce the curvature, are connected at the back to the banks by cross dykes to prevent the current during floods from forming a channel behind them (Fig. 1); (3) dipping cross dykes projecting downwards into the water from the banks, or in front of the longitudinal dykes, to concentrate the flow of the river at a low stage and increase its depth, and pointing somewhat up-stream so as to direct the water passing across them into the central channel (Figs. 1 and 2); and, lastly, (4) submerged dykes, the tops of which are kept well below the required navigable depth, placed across the deep pools found below shoals in the centre of the channel. These arrest scour in the hollows, and by moderately raising the water-level up-stream, owing to their checking the flow through the deep pools, improve the depth over the shoals above them, and adjust slightly the irregularities in the surface fall of the river, which is naturally rapid over the shoals and small over the deep portions (Fig. 1). The minimum depth in the navigable channel of the river, at its lowest stage, was increased by the regulation works from 1 foot $3\frac{3}{4}$ inches in 1878, to 2 feet $11\frac{1}{4}$ inches in 1884, and 4 feet $1\frac{1}{4}$ inches in 1893; and it is anticipated that on the final completion of the works, a depth of about 5 feet will be attained, amounting to a gain of $3\frac{5}{8}$ feet of water at the lowest water-level. Before the commencement of the works, navigation on the Rhône below Lyons was impracticable for three months in the year, difficult during four months, and easy for the remaining five months; whereas now, navigation is only liable to be interrupted during a fortnight, is difficult for another

[1] *Encyclopædia Britannica*, 9th edition, vol. xx. pp. 571–581, and Plate V.

[2] *Sixth International Inland Navigation Congress*, The Hague, 1894, "Regulation of Rivers at Low Water," H. Giradon.

fortnight, and is easy for fully-laden vessels during eleven months in the year.

The success of regulation works depends largely upon the degree of uniformity in the flow of a river, and especially on the volume of the minimum discharge and its duration; and consequently, these works are best suited for the lower portions of large rivers, where the regularity of flow attains a maximum, and are not adapted for rivers with a very variable discharge. Thus the Rhône, in spite of its considerable fall, possesses capabilities for regulation in respect of its flow; for its minimum discharge just below the confluence of the Saône at Lyons is four times that of the Seine at Paris. The volume of its flow exhibits a greater regularity than many rivers of similar size, owing to the flow of the main river being regulated by passing through the Lake of Geneva, and the occurrence of the floods of some of its tributaries at different periods of the year. Thus the floods of the Saône, which rises in the Vosges, occur in the winter months; while the Arve, the Ain, and the Isère, coming from the Alps, are subject to floods in the summer from the melting of the snow and glaciers. Regulation works possess the merit of leaving a river entirely open for navigation, while increasing the depth and rendering the passage of vessels easier round the flattened bends; but, on the other hand, they only slightly modify the velocity of the downward flow, which continues to be a serious hindrance to the up-stream traffic in a river with a rapid current like the Rhône.

Dredging. Dredging with bucket-ladder dredgers furnishes a well-known method of gradually improving and maintaining the depth of navigable rivers over long distances; and sand-pump dredgers have been employed with success, for many years past, in gradually lowering the bars of sand obstructing the entrance channels of some of the North Sea ports. The greatly increased efficiency, however, of the powerful sand-pump dredgers constructed within the last few years, especially when provided with cutters, and still more recently with water-jet agitators, has, since 1896, enabled the Mississippi River Commission to cut temporary channels rapidly through the shifting sand-bars which impede the navigation of the Lower Mississippi at its low stage, and thereby to increase the available navigable depth of the river during the low-water season. Centrifugal pumps on the dredger draw up sand mixed with water through the suction pipes lowered down from the dredger on to the sandbank, the amount of sand thus removed from the bar being much increased by churning up the sand by large revolving steel cutters at the orifices of the pipes, or still more effectually by jets of water forcibly ejected through pipes against the sandbank by centrifugal pumps, since the cutters are liable to jam on encountering débris embedded in the bar. The sand thus pumped up is discharged, through floating pipes, some distance off into deep water on the down-stream side of the cut.

Four of these sand-pump dredgers, working on different sections of the Mississippi below Cairo in the autumn of 1897, provided a navigable depth of from 6 to 9 feet over fourteen bars during the low-water season; and the two newest dredgers were able to raise, on the average, 1523 cubic yards and 1850 cubic yards of sand respectively per hour, discharging it to a distance of about 1000 feet.[1] The dredgers start work if possible at the beginning of September, to prepare the channels across the bars beforehand, the lowest stage of the river being reached at the end of October or early in November. A channel which has been opened out maintains its depth fairly well for a certain time; but the dredgers are kept constantly ready, during the low stage, to clear away any obstructions which may make their appearance. Two additional dredgers have been since built; and it is anticipated that these six dredgers, with a seventh about to be constructed, will be able to make and maintain, each autumn, a navigable depth of 9 feet at the lowest stage over all the bars below Cairo, for a width of 250 feet; so that this depth will be always available for navigation, except when the river is closed by ice.

Canalization. Canalization, in converting a river into a succession of nearly level reaches resembling a canal, hinders navigation by the introduction of locks, which occupy time to pass through; and the discharge of the river is also impeded by the weirs needed to maintain the requisite depth of water in the dry season. Canalization, however, provides a more assured navigable depth at the low stage of the river than regulation works, especially when the low-water discharge is liable to become small; and it also generally secures a greater depth, which can often be increased to a moderate extent without difficulty or great expense. Moreover, in spite of delays in the passage of vessels through the locks, canalization is decidedly advantageous for the up-stream traffic, owing to the reduction in the velocity of the descending current by the weirs, except during high floods; and it is also safer for the down-stream traffic with rivers having a somewhat rapid current and a winding course. The time occupied in locking vessels can be much reduced by furnishing the locks with large culverts at the sides for rapidly filling and emptying the lock-chamber, and by adding an intermediate pair of gates, or a small lock, for accelerating the passage of the smaller vessels; while by placing the locks in a side cut, and erecting movable weirs which can be removed from

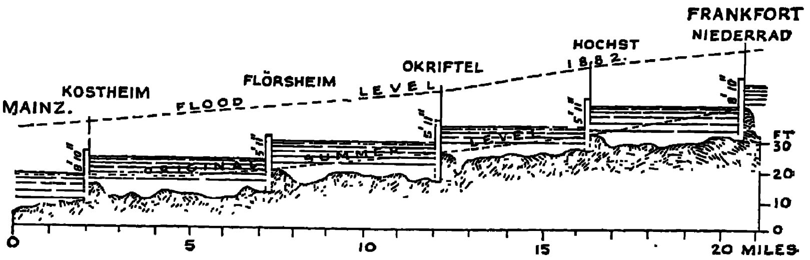


Fig. 3.—Canalization of the Main.

the channel when the river rises in flood-time, the safety of the navigation is ensured, and the river channel is left as unimpeded as possible for the discharge of floods.

One of the most successful and recent of these works is the canalization of the river Main, by the construction of five weirs and locks between Frankfort and the junction of the river with the Rhine opposite Mainz, a distance of about 22 miles, in 1883–1886,[2] and the enlargement of the locks and the provision of an increased depth a few years subsequently. The regulation of the river Main below Frankfort by longitudinal and cross dykes, previously carried out, had only secured a navigable depth of 3 feet at the low stage of the river; so that the traffic on the river had to be conducted by small barges, and, just before the commencement of the works, amounted to only about 12,000 tons a year.

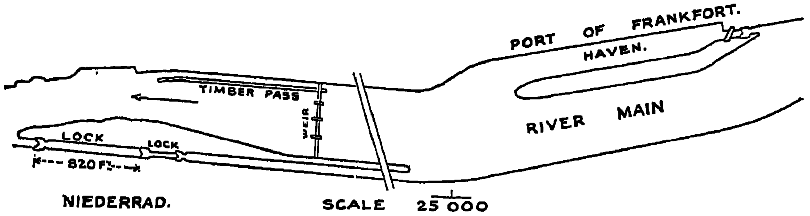

Fig. 4.—Lock and Weir on the Main.

The five movable weirs across the river, with locks in side cuts on the left bank (two with lifts of 8 feet 10 inches, and three with lifts of 5 feet 11 inches, giving an average rise from the Rhine to Frankfort of 35 feet 5 inches at a low stage), increased the navigable depth to 6½ feet at the lowest water-level (Fig. 3); and the traffic consequently rose to about 300,000 tons in 1887, in spite of the competition of two railways connecting Frankfort with the Rhine valley, one on each side of the Main. The general arrangement of the weirs and locks is indicated by a plan of the works highest up the river, 2 miles below Frankfort, given on Fig. 4. The original locks were made 279 feet long between the gates, and 34½ feet wide, in order to be able to receive the steamboats navigating the Rhine, 246 feet long and 32¾ feet broad, partially loaded; and their sills were placed 8½ feet below the water-level retained by the weirs, to allow for a further deepening of the river. The principal weir, stretching from the left bank nearly across the river, is a needle weir[3] of improved type in each case, divided by masonry piers into two to four bays, one of the openings in each weir, from 154 to 193 feet wide, serving as the navigable pass for vessels in flood-time with its sill 10½ feet below the water-level retained by the weirs. A timber pass has been formed alongside the right bank at each weir, by a long embankment in the river shutting off a channel

[3] *Encyclopædia Britannica*, 9th edition, p. 574, and Plate V. Fig. 3.

with a bottom width of 39½ feet. This is closed at its upper end by a drum weir [1] of the same width between masonry piers, with its upper paddle retaining a head of water of 5 feet 7 inches, which can be readily lowered for the passage of timber down the channel, and raised again against the full force of the current, by adjusting the water-pressure in the drum, below the sill, on the under paddle by means of sluice-ways in the river pier of the drum weir. These works were carried out by the State at a total cost of £275,000; and no tolls are charged for vessels passing through the locks. A haven has been formed above the weir near Frankfort, by an embankment in the river, about 580 yards in length, parallel to the right bank and raised above flood-level, as a refuge for vessels in winter from floods and floating ice. This also serves in ordinary times for commercial purposes, direct communication with the upper river being provided by an opening at the upper end, which is closed by a pair of gates when necessary (Fig. 4).

The great increase in traffic resulting from the above canalization led to a decision in 1889 to enlarge each of the five locks on the Main, below Frankfort, sufficiently to admit six of the largest barges navigating the Rhine with their tug at one time. A third pair of gates was erected in the cut, 820 feet below the lower gates of the original lock; and the navigable depth was increased to 8½ feet by dredging the bed of the river towards the upper end of each reach. This additional depth has enabled the river to be navigated by the large Rhine steamboats when fully loaded with 1300 tons of cargo, and drawing 7¾ feet. The river traffic, which was 9,388,640 ton-miles in 1887, rose to 22,543,700 ton-miles in 1892, and reached 36,630,830 ton-miles in 1898.

Movable weirs.

An entirely novel type of frame weir was completed on the Lower Seine in September 1885 at Poses, and a second one about 25 miles higher up a year or two later. In all the previous frame weirs, closed with square spars (needles), rolling-up curtains, or panels, erected across French and American rivers, and also in the needle weirs on the river Main, the frames which are hinged on the apron of the weir in a row, and carry a foot-bridge, are laid flat on the bed of the river in flood-time, each partially resting upon the frame previously lowered. They are therefore exposed during the winter months to the action of the flooded river, and the detritus it carries down. At Poses and Port Mort, on the contrary, the frames are suspended vertically from a wide overhead foot-bridge, and rest at their lower ends against a sill in the bed of the river; while the weirs are closed by hinged curtains, let down and rolled up again by aid of a winch travelling on a small foot-bridge formed by a series of brackets hinged to the back of each frame (Fig. 5).[2] The weir is opened by rolling up the curtains, and raising the hinged frames one by one into a horizontal position by chains from the overhead bridge, so that all the movable parts of the weir are raised out of the water in flood-time, quite secure from injury,

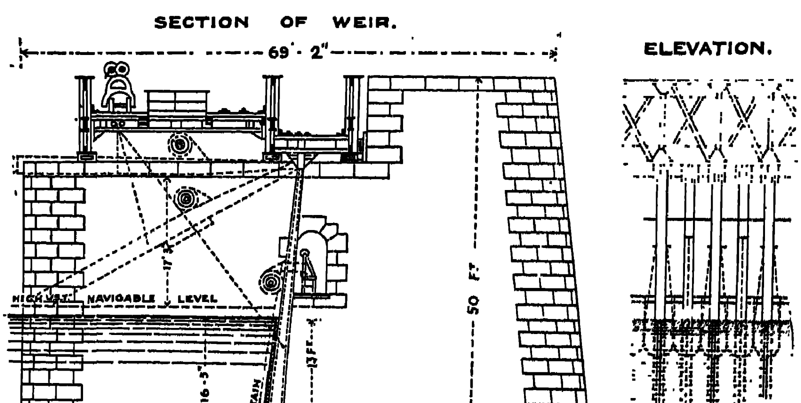

FIG. 5.—Lifting Frame Weir, Poses, River Seine.

and yet ready to be lowered for closing the weir at any time. The foot-bridges across the shallow openings have only to be placed at a sufficient height for the raised frames underneath them to be well above the highest flood-level; but the foot-bridges across the navigable passes, of which there are two at Poses, 106½ feet in width, and five at Port Mort, each about 99 feet wide, have had to be made high enough for the raised frames underneath them to leave a clear headway for vessels of 17¾ feet above the highest navigable water-level (Fig. 5). The merits of this type of weir consist in its ease of working, the security of the movable parts, and its applicability to high weirs; but the high wide piers and the broad foot-bridges necessarily make the system costly.

The drum weirs across the timber passes in the river Main are an extension to deeper channels of the system adopted originally for the shallow portions of the weirs across the river Marne, the depth of water retained by the upper paddle of the Main weirs being 5 feet 7 inches, as compared with 3 feet 7½ inches at the Marne weirs, and the radius of the drum 6 feet 11 inches in place of 4 feet 3 inches. The most notable example, however, of this type is the drum weir, erected at about the same period as the Main weirs, across the navigable pass of the weir constructed for canalizing the river Spree at Charlottenburg.[3] The upper paddle of this weir, 39½ feet wide, retains a depth of 9½ feet of water above it; and the drum in which its lower paddle revolves, on a

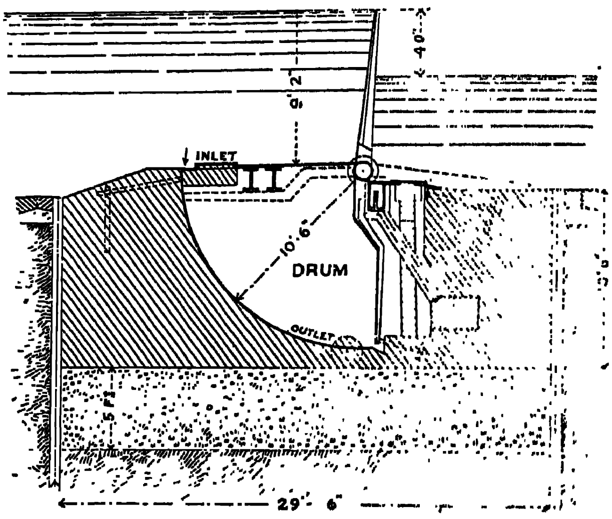

FIG. 6.—Drum Weir, Charlottenburg, River Spree.

horizontal axis common to the two paddles, in opening and closing the weir, has a radius of 10½ feet (Fig. 6). A bridge resting on the abutment of the right bank, and on the river pier of the drum weir, spans the opening closed by the weir, and affords a headway for vessels of slight draught over 11½ feet for nearly the whole width [illegible] high flood-level, which is about 6 feet higher than the normal water-level retained by the weir. The great value of this type of weir is the ease and rapidity with which the weir is not only lowered, but also raised against a very strong current, rendering it peculiarly suitable for regulating the discharge at a weir, and for controlling passes which may have to be frequently and quickly opened and closed. It possesses, however, the serious drawback of the large cost involved in the construction of the drum, which, irrespectively of its foundations, has to be carried down deeper below the sill of the weir than the height of the actual weir formed by the upper paddle. It can therefore be only adopted with advantage where ease and rapidity of working are so essential that the cost is quite a secondary consideration. Accordingly, though drum weirs were first constructed on the river Marne between 1857 and 1867, to provide a movable crest on the top of eleven submerged solid weirs, the system was not extended until much later to the closing of passes under somewhat exceptional conditions in Germany.

A modification, however, of the drum weir for forming a movable crest, 7 feet high, on the top of [illegible] resting upon piles, and raised 11½ feet above the bed of the [illegible] river, a tributary of the Missouri, in connection with its [illegible], has been experimented on with a full-sized model, [illegible] of construction.[4] The weir across the river, adjoining the lock, built

close alongside the left bank, consists of ten bays, each 75 feet in width, separated by masonry piers containing the sluice-ways for connecting the drums with the upper or lower pool. The movable portion of the weir, extending along the crest of each bay, is formed by a sector of a circle, subtending an angle of 67½°, encased all round with close planking, and strengthened internally by iron framing. The sector, which revolves on a horizontal axis along the crest of the solid weir, forms the upper 7 feet of the weir when raised, and, when lowered, fills the drum at the back of the solid weir, which has a radius of nearly 9 feet, and is encased in close planking. A triangular space is left between the underside of the lowered sector and the down-stream vertical face of the concrete weir, through which the water-pressure, developed on opening communication with the upper pool, raises the sector and closes the weir. The completion of the weir was delayed by floods in 1900.

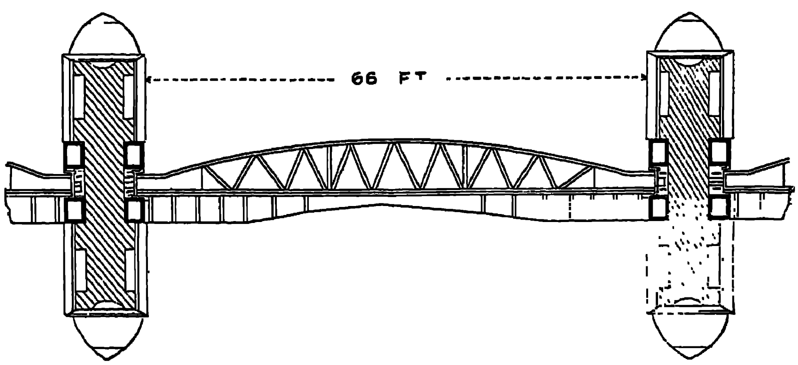

FIG. 9.—Plan of Works at Richmond, Surrey

Richmond weir. The half-tide lifting-gate weir, with overhead foot-bridge, erected across the river Thames at Richmond in 1891–94, may be quite as fairly regarded as a type of movable weir, as the weirs with frames suspended from an overhead foot-bridge at Poses and Port Mort on the Seine. In both cases the overhead bridge forms a necessary fixed adjunct for operating the weir; the river piers carrying the foot-bridge are inevitable obstructions in the channel in flood-time, though of no great importance; and all the movable parts can, in each case, be readily removed from the river, so as to leave the channel unobstructed, with the exception of the piers, and secure the parts themselves from injury during the descent of floods. The openings, indeed, between the piers are wider at the Seine weirs; but, on the other hand, the Richmond weir is much more rapidly opened and closed. It was erected to retain the river at half-tide level between Richmond and the tidal limit at Teddington, so that the unsightly mud-banks which had become exposed at low tide, owing to the considerable lowering of the low-water level resulting from the removal of obstructions and dredging in the channel below, may be always covered with water, without abstracting the whole of the tidal flow and ebb between Richmond and Teddington from the river below. The lifting-gates forming the weir are 12 feet high, and close the three central spans, each 66 feet in width, of the arched double foot-bridge, when the river falls below half-tide level on the down-stream side of the weir (Figs. 7, 8, and 9).[1] The gate, when being lifted, slides in a recess in each pier against a vertical row of free rollers suspended by the loop of a chain attached at one end to the pier and at the other end to the gate, whereby the friction due to the water-pressure against one side of the gate is much reduced. The raising of the gate, weighing 32 tons, is further considerably facilitated by its being counterpoised by weights above (Fig. 8). The discharge of the fresh-water flow of the river, during the lower half of the tide, is provided for by slightly raising the gates above their sills proportionately to the volume of the flow. As soon as the rising tide has reached half-tide level, the gates are lifted out of the water, and on approaching the level of the crown of the arch, are turned by guides in the piers into a horizontal position between the two foot-bridges, so as not to interfere with the view of the river through the arches. Here they remain till the fall of the river again to half-tide level necessitates their being lowered. Each gate can be fully raised in seven minutes by two men on the foot-bridge. The similar weirs erected at Belleek in 1883, and at Ballinasloe in 1885, for controlling the drainage works above them on the rivers Erne and Suck, and enabling works to be carried out to facilitate the discharge of floods, close four openings each, only 30 feet, and 25 feet in width respectively. Their gates are merely raised for the passage of the river water; and the head of water against these weirs, as in all non-tidal rivers, is always on the up-stream side. At Richmond, however, though the head of water against which the much wider gates there have to be raised is usually considerably less than at Belleek and Ballinasloe, the water-pressure may be on the down-stream side with a rising tide. On this account, free rollers have had to be provided on both sides of the gates; and the complete raising and lowering of the Richmond weir gates is a daily operation, except during floods and at night.

Outlets of Tideless Rivers.

The success which resulted at the Sulina mouth of the Danube, and at the South Pass outlet of the Mississippi, from the concentration of the discharge by the formation of parallel jetties, extending beyond these outlets towards their bars, which were considerably lowered by the induced scour over the shoals, has been previously described.[2] The period, however, which has elapsed since the jetty works were carried out enables a more accurate view to be formed of the prospects of the continuance of the improved depth over the bars in front of these outlets, and to determine whether an extension of the jetties is likely to be required in the near future, either at the navigable outlet of the Danube, or the Mississippi. The prolongation of the current of a sediment-bearing river farther out into a tideless sea, by extending parallel jetties beyond its outlet, does not merely lower the bar in front of the outlet by scour, but also enables the issuing current to convey the materials with which it is charged into deeper water. Here the continual accumulation of deposit takes much longer to rise to a sufficient height to impede navigation,

[1] *Engineering*, vol. lxi. p. 47, and plate.

[2] *Encyclopædia Britannica*, 9th edition, vol. xx. pp. 580–581, and Plate V. Figs. 19 to 23.

and sometimes brings the suspended matter within the influence of a littoral current which occasionally flows across in front of the outlet at a short distance from the shore. The rate of advance of a delta depends upon the volume and density of the materials brought down by the river, the depth of the sea in front of the outlet, and any disturbing influences which may be encountered in the sea outside, such as a littoral current or wave-action.

Sulina Outlet of Danube. The Sulina jetties extending the outlet of the Sulina branch of the Danube beyond the coast into the Black Sea, which increased the depth in the navigable channel over the bar from 10 feet to 20 feet by the scour alone of the concentrated current, maintained this latter depth up to 1894, when dredging with a bucket-ladder dredger was carried out in the shoal parts of the channel between and beyond the jetties. The available depth was thus increased to 24 feet by the autumn of 1895, in spite of deposits which necessarily occurred from the alluvium brought down by the floods of the river. Notwithstanding, however, the remarkable maintenance of the depth obtained by works completed about 1870, and the facility with which the depth has been increased by dredging, a comparison of the charts of 1856 and 1894 shows that though the inevitable accumulations of deposit have not hitherto affected the available depth of the navigable channel, their influence on the depth of the sea at some distance in front of the Sulina outlet is clearly manifested by the steady advance seawards of the 5-fathom line, which amounted to an average of 59 yards a year between 1856 and 1894.[1] The shoaling, indeed, is somewhat slow, owing to the lightness of the alluvium brought down by the Danube, and to this alluvium being brought under the influence of a southerly littoral current, and it has mostly taken place in greater depths than the shallowest part of the navigable channel; but the deposits, which have been considerable in depths of between 3 and 5 fathoms, will, in course of time, raise the shoals to a height inconvenient for navigation, and necessitate an extension of the jetties. Moreover, it has been calculated that the Sulina mouth will, in about 170 years, come within the zone of the large deposits of the rapidly advancing Kilia outlets to the north of Sulina.

South Pass outlet of Mississippi. The parallel jetties, 1000 feet apart, extending from the outlet of the South Pass of the Mississippi into the Gulf of Mexico, which increased the maximum available depth at the outlet from 8 feet in 1875 to 31 feet in 1880, have not been able to maintain the stipulated depth of 26 feet, for a width of 200 feet, and a central depth of 30 feet quite continuously, either in the jetty channel itself, or outside to deep water in the gulf. Up to the middle of 1898 there had been a

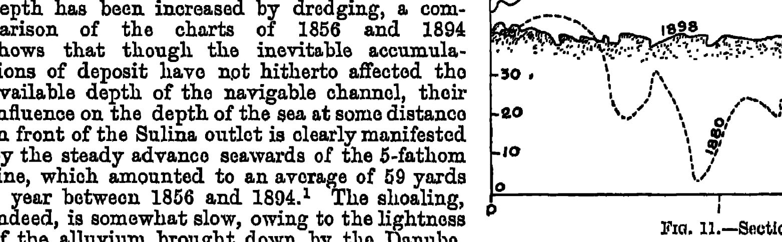

Fig. 10.—Plan of Jetties, South Pass Outlet, Mississippi River.

deficiency of depth in the jetty channel on 309 days, and outside on 44 days, during a period of about 17½ years.[2] Efforts have been made to secure the required depth in the jetty channel by narrowing the channel to a width of about 650 feet by inner jetties, with some projecting spurs effecting a further reduction in width of about 50 feet (Fig. 10), and also by dredging, which has, moreover, been employed to a small extent for deepening the outer channel. In the year 1897–98 dredging was carried on during 50 days in the jetty channel, and 5 days in the channel outside, and the proper depth appears to have been maintained during the year, except for 4 days in the jetty channel; but in the previous year there was a deficiency of depth during 133 days in the jetty channel, and during 4 days outside. The jetty works, accordingly, which produced such a large increase in depth at the outlet of the South Pass, have been unable to maintain the depth for twenty years after their completion. The changes which have occurred at the outlet are indicated by the plan showing the lines of soundings in front of the outlet in 1883 and 1898 (Fig. 10); and by longitudinal sections of the jetty and outer channels, in 1875 before the commencement of the jetty works, in 1880 after their completion, and in 1898 (Fig. 11). Deposit from the river is evidently taking place in front of the outlet, being shown upon the plan by the advance of the lines of soundings since 1883, and by the relative depths on the section in 1880 and 1898. The greatest advance occurred at the 70-feet line of soundings, amounting to 2154 feet between 1877 and 1897, and averaging 108 feet a year; whilst the 20-feet line of soundings shows the least advance of 655 feet, or an average of 33 feet a year. In a fan-shaped area of 1½ square miles, extending out about 5300 feet from the

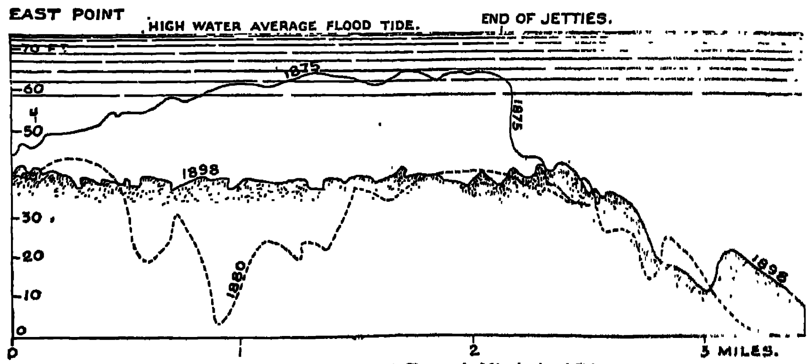

Fig. 11.—Section of Outlet Channel, Mississippi River.

extremities of the jetties, there has been an average reduction in depth all over of 17½ feet between 1876 and 1899, the accretion being slight near the jetty channel, except on the western side, and greatest in the outer zone.[3] The outer 30-feet channel is already somewhat narrow, and is deflected to the east of the jetty channel; and considering the large quantities of alluvium which are being deposited in the outer channel about a mile beyond the jetties (Fig. 11), it seems probable that though the central 30 feet in depth may be maintained for some little time longer by the aid of dredging, an extension of the jetties will be necessary to carry a channel of the required depth across the bar in process of formation again beyond the outlet.

Outlets of Volga. Great difficulties have been experienced in the attempts to improve the depth at the outlets of the two main branches of the Volga delta, owing to the great width of the shoals obstructing these channels, the shallowness of the Caspian Sea in front of the mouths of the Volga, resulting in the rapid advance of the delta, and the exposed position of the outlets. Many years ago an endeavour was made to improve the outlet of the smaller Kamysiak branch, by concentrating the discharge in one of its outlet channels by a discontinuous line of fascine mattresses on each side, and closing the minor outlets of this branch, and also by dredging to a small extent. These works, however, gave little permanent increase in depth, owing to the discontinuity of the training or jetty works, the injuries they are exposed to from waves and ice, and the shallowness of the foreshore in front of the outlet. Subsequently, the larger Bakhtemir branch was deepened by dredging its shoals along a total length of 5⅜ miles, increasing the available depth at the ordinary water-level from about 4 feet to 8 feet, which latter depth has been maintained for several years; but a further increase of even 1 foot in depth would necessitate dredging through 17 miles of shoals. Accordingly, in order to obtain a deeper channel than 8 feet between Astrakhan and the Caspian, it is proposed to revert to the Kamysiak branch.[4] This possesses an available depth of 14 feet between Astrakhan and its bar, which is only about 1½ miles across; its outlet is much nearer 3 fathoms depth in the Caspian than the Bakhtemir outlet; and its discharge being less, the advance of the delta at its outlet is less than at the other outlet. With a [illegible], it is anticipated that the depth on the Kamysiak bar [illegible]

from $4\frac{1}{2}$ feet to 14 feet, and maintained without difficulty, so as to provide an available depth of 14 feet between Astrakhan and the sea.

When a considerable increase in depth is required across the bar of one of the deltaic outlets of a tideless river, it must be obtained by the construction of parallel jetties extending out towards the bar, whereby the concentrated current scours a channel through the bar. A small additional increase in the depth of the outlet channel thus formed may sometimes be obtained, or the original depth maintained, by dredging across narrow shoals which occasion a reduction in the available depth. Eventually, however, the continual deposits of alluvium brought down by the river in the sea in front of the outlet will lead to the reappearance of the bar farther out, which, owing to the volume of the accretions in the sea formed by large sediment-bearing rivers, can only be prevented from impeding navigation by a prolongation of the jetties, resulting in the formation of a deep channel across the bar for another period. Where the sea is shallow in front of a deltaic outlet, and the river current feeble, the conditions are not favourable for an improvement of depth by parallel jetties; but, provided the shoals obstructing the outlet channel are not very wide, and the proportion of sediment brought down not very great, a moderate increase in depth may be obtained by large and continuous dredging operations.

The Improvement of Tidal Rivers.

Since the size and depth of tidal rivers mainly depend on the volume of tidal water entering the river, especially when the tidal rise is large and the fresh-water discharge small, the maintenance or, where practicable, an increase of the tidal volume constitutes a primary consideration with regard to any proposed improvement works in the tidal portions of rivers.

The tidal condition of any river is very well shown graphically, by a series of simultaneous tidal lines, obtained from simultaneous observations of its varying height, taken at several stations along the river, at suitable intervals, throughout a whole tide; for when these respective sets of heights are plotted at their relative distances apart, and joined by lines, these simultaneous tidal lines represent the actual surface of the river at the particular times when the observations were made (Fig. 12). The passage of a tide up and down a river is thereby clearly indicated, and any irregularities in the flow are manifested; while the lines enable the volume of

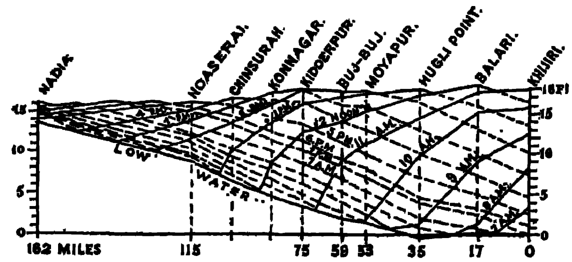

FIG. 12.—Simultaneous Tidal Lines, River Húgli.

tidal water entering a river to be calculated. Simultaneous tidal lines of the river Húgli, derived from tidal observations made throughout a spring tide during the dry season, at several stations along the river, from near the mouth of the estuary up to Nadia, only about 5 miles below the tidal limit, a distance of 162 miles, are given in Fig. 12, in which the vertical scale has been made very much larger than the horizontal to magnify adequately the variations in the water-level at different periods of the tide. The full lines in the diagram show the successive levels of the flood tide, and the dotted lines the levels of the ebb tide.

Tidal bores.

The appearance of a nearly vertical face at the upper end of the simultaneous lines representing an incoming tide, as visible (Fig. 13) to some extent opposite Moyapur, and more marked at Konnagar and Chinsurah, indicates that the flood tide encounters obstructions to its progress along this portion of the river, leading to the formation of a *bore*. This phenomenon occurs when the flood tide at the

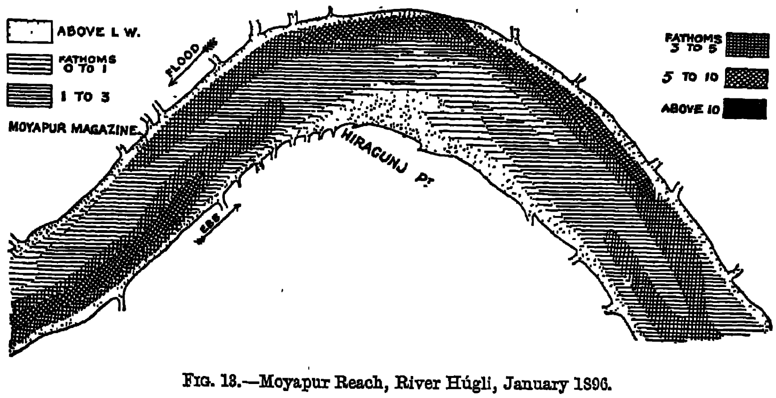

FIG. 13.—Moyapur Reach, River Húgli, January 1896.

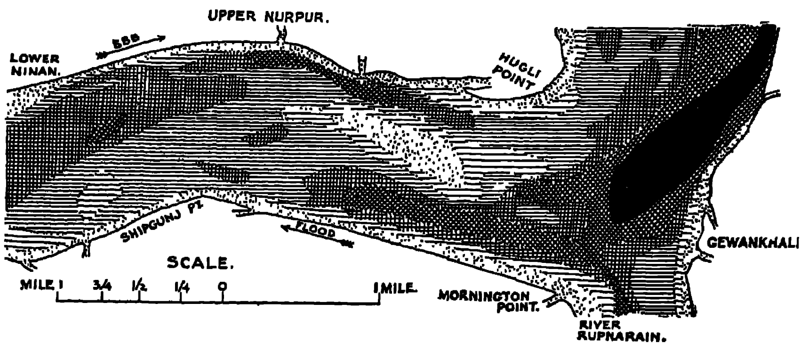

FIG. 14.—James and Mary Reach, River Húgli, April 1890.

height of springs, especially when raised by a narrowing river and impelled by wind, in flowing rapidly up the channel is checked by shoals, till the tide rising behind gains a sufficient head to overcome the frictional resistance and impel the water over the shoal. Under these conditions, the earliest part of the flood tide travels up the river like a breaking wave with an almost vertical face, producing on its passage an instantaneous reversal of the current and a sudden rise of the river. Bores of 6 to 7 feet in height have been often observed on the Severn, the Seine, and the Húgli; whilst bores of 10 to 15 feet high are said to have passed up the Amazon and the Tsientang-kiang. By lowering the obstructive shoals by training works or dredging, the passage of the flood tide is facilitated, and the bore consequently reduced in height; and at the same time the navigable channel is improved, and the tidal condition of the river ameliorated.

Navigable channels.

Tidal rivers in their natural condition have a winding course, accompanied by irregularities in depth; and the gradual erosion of the concave banks at bends often effected by the current, which is followed by accretion in front of the convex banks, aggravates these defects. The main current of the river, flowing in a direct line, when not impeded by any obstacle, impinges against the concave bank opposing its course at a bend, where, being guided and deflected by this bank, it scours out and maintains a deep channel close alongside the bank. At the termination of the concavity of the bank at the end of the bend, the current being no longer controlled, passes in a straight direction diagonally across the river to the following concave bank facing its path at the next bend. Deep channels are consequently always found alongside the concave banks of a winding river; but the main current being perfectly free in crossing over from one concave bank to the next on the opposite side, spreads out and varies somewhat in direction, in accordance with changes in its velocity and obstacles encountered, so that its scouring influence becomes irregular and much reduced at the crossing, and the navigable channel is shallow, and liable to shift somewhat between the bends. Where scour occurs at the concave bank, the further deterioration of the river should be prevented

by protecting these banks from erosion with suitable materials, or by putting out dipping cross dykes to direct the force of the current away from the bank into a more central channel. In rivers above the tidal limit, the shoals in the channel between the bends can be lowered by narrowing the river at these places, so as to direct and concentrate the current at the crossing, and thereby increase its scour, and deepen the channel.

The improvement of the navigable channel between bends in a tidal river is a more complicated problem, because in this case an adequate narrowing of the channel between the bends would check the influx of the tide; and the flood and ebb tides, flowing in opposite directions, tend to follow a different course along opposite banks between the bends, and to form, consequently, two distinct channels. The main currents, accordingly, of the flood and ebb are liable to act in antagonism; and where they pass alongside opposite banks, the gradual erosion of both these banks leads to a widening of the river, and an increasing divergence of the channels formed by the flood and ebb currents respectively. The result is the growth of a central shoal between the channels at the crossing, which reduces the available depth for vessels (Figs. 13 and 14). The ebb tide and the fresh-water discharge, constituting the descending current, necessarily follow the same course as the downward current of a non-tidal river, and generally form the navigable channel, especially when the fresh-water discharge is large; whereas the ascending flood tide takes a somewhat straighter course, and tends to form blind channels in the shoals between the bends, nearer the convex banks than the ebb-tide channel. Eventually, however, the two main currents of ebb and flood both come, at different points, into the deep channel alongside each concave bank.

The divergent channels formed by the ebb and flood tides, in cases where the flood tide has the predominance during a portion of the year, owing to the smallness of the fresh-water discharge in the dry season, are very clearly exhibited on the low-water charts in the dry season of the two worst crossings on the river Húgli below Calcutta, given in Figs. 13 and 14.[1] At the Moyapur crossing (Fig. 13), the main current of the ebb tide forms a deep channel along the concave right bank almost down to Hiragunj Point; and when the right bank, becoming convex, turns away from the direction of the ebb current, this current disperses, and passing over a shoal which it is no longer concentrated enough to scour, it finally reaches the opposite bank near the centre of the bend, whence, being guided by the concave left bank, it runs in a deep channel along this bank to the next change of curvature. The main flood-tide current, on the other hand, coming along the right bank from the bend below, after forming some blind channels towards this side, passes on to the left bank, over a shoal projecting from the point near the centre of the bend, which it follows in a deep channel to the change of curvature above, where the current is dispersed and the deep channel ceases. In the James and Mary reach (Fig. 14), the main ebb current follows the concave left bank till the curving away of this bank towards Húgli Point leaves the current undirected, which results in the spreading out of the current and the consequent disappearance of the deep channel in passing on towards the opposite bank. The main flood-tide current runs up from below along the right bank opposite Húgli Point, at right angles to the ebb-tide channel which it silts up more or less at the extremity in the dry season; and passing round the sharp concave bend of the right bank, it is at length dispersed on approaching Shipgunj Point in the centre of the bend; and the deep channel formed by its scour alongside the right bank terminates in a shoal. The extent of the deep ebb- and flood-tide channels, and the depth over the dividing shoal, vary according to the changes in the relative scouring power of the ebb and flood currents at the different seasons of the year, and the volume and duration of the floods passing down in the rainy season; but the gradual widening of the two reaches, by erosion along both banks, has led to a reduction in the depth over the crossings at the worst periods, and to the appearance in the middle of the James and Mary reach, since 1865, of a sandbank which dries at low water of spring tides in the dry season, and by its growth has still farther separated the ebb- and flood-tide channels.

In winding tidal rivers, where the descending current predominates, and forms a continuous low-water channel which serves as the navigable channel, the diverging action of the flood tide in forming blind channels between the bends, may be mitigated by widening and deepening the ebb-tide channel at the place where the flood-tide channel diverges, and on the side to which it deviates. In this way the influx of the flood tide into the enlarged ebb-tide channel is facilitated, and its flow diverted from the blind channels without impeding its progress up the river, and, consequently, without reducing the tidal capacity, upon the preservation of which the maintenance of tidal rivers largely depends.

Tidal rivers in tropical countries are subject to much greater variations in their conditions of flow than those in temperate regions; for during the rainy season the downward current overpowers the tidal influx in the upper tidal part, the rise of tide at some distance from the outlet being merely due to the backing-up of the fresh-water discharge, and the deep channel corresponds to that formed by the current of a non-tidal river. During the dry season, on the contrary, the fresh-water discharge becomes so insignificant that the rivers depend almost wholly for their maintenance on the flow and ebb of the flood tide. Moreover, the fresh-water discharge is obliged to obtain an outlet to the sea; whereas the flood tide only flows up a river where space is available for its reception; and therefore for those rivers whose maintenance depends on the flood tide for a portion of the year, no

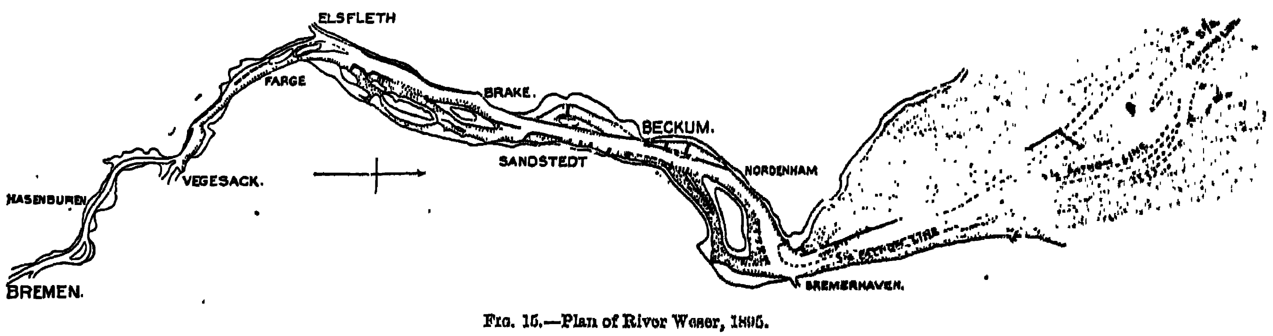

FIG. 15.—Plan of River Weser, 1895.

works should be undertaken which might impede its influx, and every effort should be directed to facilitating its progress. The improvement, accordingly, of winding rivers under these conditions, such, for instance, as the Húgli, which depends on the tidal flow and ebb for its maintenance during about two-thirds of the year, should aim at guiding the descending current by a very low concave training wall, forming a somewhat projecting continuation of the concave bank alongside which this current flows, into the flood-tide channel on the opposite side at a crossing, as proposed for lowering the shoals at Moyapur, and the James and Mary reach.[2] By this arrangement, the freshets in the rainy season would scour out a channel across the shoal at the crossing, and maintain the down-stream part of the flood-tide channel along the opposite bank, which they otherwise would silt up; and thus whilst the incoming flood tide, on the subsidence of the freshets, would not be impeded by the low training wall, submerged at, or even below, the lowest low water, on the land side of the ebb-tide channel, it would find a continuous channel prepared for it by the freshets whereby its progress up the river would be facilitated; and thus both the tidal condition and the navigable depth of the river would be improved.

Regulation of the Weser.

Occasionally the systematic regulation of a tidal river of moderate size has been undertaken between a town of importance on its banks and its outlet into the sea or its estuary, with the object of improving its navigable condition for sea-going vessels, instead of confining the improvement works to special obstructions in the channel, which is all that can be attempted in large rivers. Two instances of the regulation of tidal rivers, by aid of training works and dredging, are furnished by the works on the river Weser between Bremen and Bremerhaven, carried out for the most part between 1887 and 1891, though the channel has been subsequently further deepened by dredging, and on the river Nervion, on a smaller scale, between Bilbao and the sea from 1878 to 1891.

The river Weser, draining an area of 18,600 square miles, and with an average tidal rise at its outlet into its estuary at Bremerhaven of nearly 11 feet, had formerly a very irregular channel,

[1] *Report on the River Húgli*, L. F. Vernon-Harcourt, Calcutta, 1897, plan 6, fig. 3, and plan 7, fig. 2.

[2] *Ibid.*, pp. 89 to 94, and plan 6, fig. 3, and plan 7, fig. 4.

obstructed in many places along the lower 31 miles by islands, and by shoals emerging at low water, which so impeded the influx of the flood tide that the tidal limit was reached at Bremen, 42 miles above Bremerhaven, the available navigable depth up to Bremen being only 9 feet. The river has been trained from Bremen downwards, by 22¾ miles of training walls, and 9½ miles of cross dykes and dams, into a single straightened channel increasing regularly in width seawards.[1] Thus the flood tide is freely admitted up the river; and uniformity of flow is obtained, so as to avoid the formation of shoals by a reduction at places in the velocity of the current (Fig. 15). The low-water channel was made as small as practicable consistently with providing for the discharge of the low-water flow, in order to maintain its depth and regulate its flow; and where necessary it has been trained by low-water training walls of fascine mattresses, backed by materials dredged from the channel. The high-water channel has been left as large as possible, in order to maintain the tidal capacity, and thus by reinforcing the scour of the ebb to preserve the depth of the low-water channel. By these works, together with over 40 million cubic yards removed by dredging, the navigable depth up to Bremen has been increased to 16½ feet (Fig. 16), the volume of tidal water entering and leaving the river has been materially augmented by the lowering of the low-water line, the tidal limit has been extended about 5 miles above Bremen, the discharge of floods has been accelerated, and the liability of the river to be blocked by ice has been diminished owing to the increased tidal flow and ebb. The navigable depth is eventually to be increased to 22 feet by dredging.

The river Nervion has similarly had its channel straightened and deepened between Bilbao and its mouth, a distance of nearly 8 miles, by training works. These works have enlarged the width from 210 feet at Bilbao to 525 feet at the outlet (Fig. 17); have facilitated the influx of the tide, which has an average rise of 9 feet at the mouth of the river; and have increased the navigable depth in the channel up to the port of Bilbao by about 7 feet, thereby providing a minimum depth of 12 feet at the lowest low water.[2]

Improvement of outlets.

It has previously been stated that a bar often obstructs the outlets of tidal rivers, because the heaping-up action of the sea, aided by the drift of sand and shingle along the coast under the influence of the prevailing winds, tends to form a continuous beach across their mouth;[3] and some account has been given of the jetties constructed at the outlets of certain tidal rivers for lowering their bars.[4] The works, however, carried out for improving the outlets of the Weser, the Nervion, and the Mersey possess certain novel features rendering them worthy of notice.

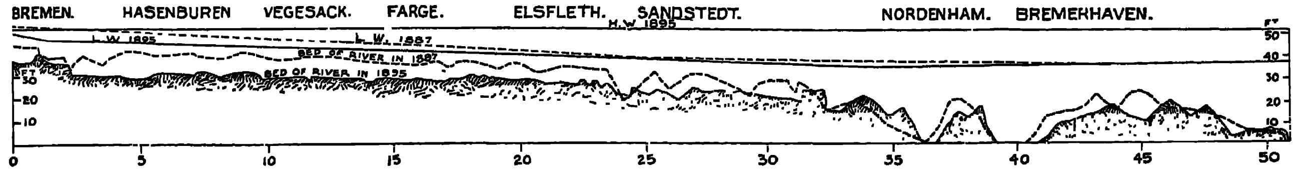

Fig. 16.—Longitudinal Section of the River Weser.

The river Weser on passing Bremerhaven emerges into a wide estuary encumbered by sandbanks rising above low water; but the channel in the estuary, instead of being carried through the estuary between two training walls, is guided by a single fascine mattress training wall forming a continuation of the left bank of the river at low-water level, 3⅝ miles long. This, with the adjacent shore line opposite, provides an expanding outlet for the river through the upper part of the estuary. Secondary and side channels farther down the estuary have been closed, in order to concentrate the scour in the main channel; and the outlet channel is to be further deepened by dredging, aided, if necessary, by an extension of the training wall (Fig. 15).

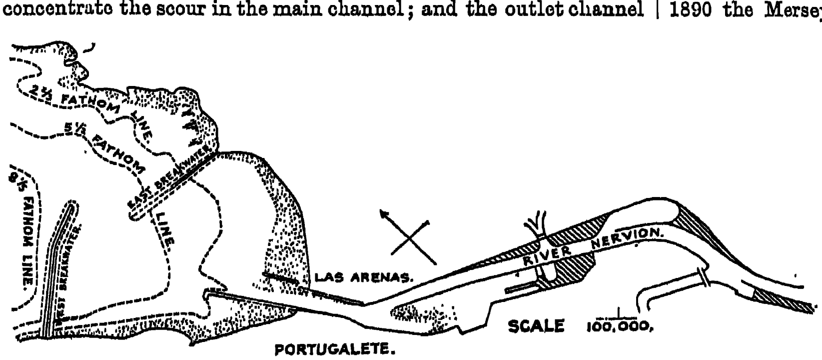

Fig. 17.—Plan of Outlet, River Nervion

As the outlet of the river Nervion was fully exposed to the waves of the Bay of Biscay, the sea had heaped up a bar across it, with an available depth of only 4½ feet over it at the lowest tides. This bar has been removed by the scour of the river guided between two jetties carried out from the shore on each side of the outlet, and by the concave prolongation of the western jetty, aided by dredging, so that a depth of 15⅝ feet has been secured in the outlet channel (Fig. 17). In order to prevent the obstruction of the improved outlet by drift during north-westerly storms, and to provide a sheltered approach to the river for vessels on that very exposed coast, two breakwaters are being constructed projecting from the coast on each side of the mouth of the river, and converging together so as to provide a harbour in which vessels will be fully protected,[5] and from which they can pass into the river in perfect safety (Figs. 17 and 18).

The bar of the river Mersey is about 11 miles seawards of the actual mouth of the river at New Brighton; and this fact, combined with the configuration of the adjacent coast and the exposure of the site, prevented any attempt from being made to lower the bar by the concentrated tidal scour which would be produced by carrying out longitudinal or converging solid jetties or breakwaters from the shore to the site of the bar. Accordingly, up to 1890 the Mersey bar remained in its natural condition, with a depth in the main channel across it of only 10 to 11 feet at low water of spring tides, under ordinary conditions, thereby causing delay to vessels of large draught in getting up to Liverpool. In 1890, however, two sand-pump dredgers were tried for the first time for lowering the bar. This system had been successfully employed in a considerable deepening of the approach channel across a sandy foreshore of the open sea, at Dunkirk since 1876, and at Calais since 1881, and had effected an increase in the depth of the approach to Ostend harbour from 6½ feet at low water of spring tides in 1880 up to 20½ feet in 1884; whilst the dredging of Gedney's Channel at the entrance to New York harbour, undertaken in 1885, had eventually increased the navigable depth from 24 feet up to 30 feet at low water for a width of 1000 feet. These sand-pump dredgers, which were able to raise and load themselves with 500 tons of sand in between 20 minutes and 1 hour, according to the conditions, increased the minimum depth in the channel across the Mersey bar from 11 feet in 1890 to 18 feet at low water of spring tides by the beginning of 1892; but the dredging

Fig. 18.—Section of West Breakwater, River Nervion.

done by them in 1892 and 1893 only widened the channel, without increasing its depth.[6] In 1893, however, a large specially-built sand-pump dredger was set to work, with hoppers capable of holding 3000 tons of sand, which the sand-pump is able to fill in

between half and three-quarters of an hour;[1] and a second similar dredger was added in 1895, to aid or replace the first in the event of a breakdown, though work is generally carried on in the bar channel with only one of the dredgers. By means of this increase of the dredging plant, the depth in the bar channel was increased in two years, by the middle of 1895, from a minimum of 18 feet to 23 feet, and from an average of 20½ feet to 24½ feet over a width of 1500 feet[2]; and these depths were further increased by the middle of 1899 to a minimum of 27 feet, and an average of 28 feet for the same width, by the removal, since 1890, of over 41 million tons of sand from the bar and inner shoals, 29 million tons of which were raised in the last four years of the period.[3] These dredging operations have enabled vessels of large draught to cross the bar at any state of the tide. A greater depth of channel could be obtained if necessary, though it would involve the removal of an increasing amount of sand for each increment of depth gained. The deepening of the bar channel has caused an additional volume of tidal water to be drawn into it from other outlets in the estuary, which will assist in maintaining the channel; but dredging will always be necessary to preserve the depth attained.

Working models and experimental channels have been occasionally employed for investigating the movements of water, and their effects on an unstable bed.

Probably the first model exhibiting the ebb and flow of tide in an estuary was the one made of the inner Mersey estuary in 1885, with the object of indicating that the slight regulation in places of the Cheshire shore of the inner estuary between Runcorn and Eastham, proposed at that time for the Manchester ship-canal, and subsequently carried out closer inshore, would produce no appreciable effect on the tidal condition of the estuary. After the water-level had been raised and lowered many times in succession at the outer extremity of the model, producing the effect of a number of tides, a very fair resemblance in miniature to the channels and banks of the inner Mersey estuary at low water was obtained in the sandy bed of the model.[4] In 1886 a working model of the Seine from its tidal limit to the sea beyond its estuary was constructed, with the object of ascertaining whether the accretion caused by training walls in a tidal estuary encumbered with sand could be reproduced in a model, and the effects, accordingly, of the various schemes which had been proposed for the prolongation of the Seine training works in its estuary could be determined. After various substances had been tried for forming the bed of the model, an extremely fine clean sand mixed with peat was employed. A previous condition of the Seine estuary, as recorded on a chart of 1834 before any training works had been commenced, was eventually very fairly reproduced in the model, in which the tidal flow and ebb, with a period of 25 seconds and a range of 0·71 inch, were effected by the tipping of a hinged tray of suitable size fixed to the outer end of the model, at the proper angle for the current produced to correspond with the direction of the tidal propagation at the entrance to the Seine. The fresh-water discharge was supplied from a little cistern at the upper end of the model.[5] The well-known bore, moreover, of the Seine, which attains its maximum at Caudebec, and also the reverse current, or second tide, which occurs just before high water at Havre, were clearly visible when the model was worked. The lines of the existing training walls in the Seine estuary were then inserted, in the form of strips of tin in the model; and the accretion caused by them in the Seine estuary having been reproduced after the action of a large number of miniature tides, the various lines proposed for the extension of the training works seawards were successively introduced, and their several effects on the estuary recorded on low-water charts. On the completion of these experiments with the Seine model at the end of 1888, similar investigations were made with a model of the Mersey, extending from the tidal limit right out into Liverpool bay beyond the bar. These furnished interesting results as to the effects of training works in the inner and outer parts of an estuary very different in form from that of the Seine.[6]

Model experiments.

These investigations appear to prove the feasibility of testing the effects of training works in a sandy estuary by means of working models. Engineers will thus be enabled to avoid works which might result in the deterioration of a tidal estuary, and to select with confidence beforehand the particular scheme which affords the best prospects of a successful issue.

Additional information about river engineering and subjects connected with it will be found in the following books and papers: L. F. Rivers, Anthony de Wydeville, or WOODVILLE, 2ND EARL OF (1442–1483), an enlightened statesman and patron of literature, and author of the first book printed on English soil, was the son of Richard de Wydeville (1408?–1469) and his wife, Jacquetta de Luxembourg, duchess of Bedford. His father was raised to the peerage in his son's infancy, and was made an earl in 1466. Anthony, who was knighted before he became of age, and fought at Towton Wydeville in 1461, married the daughter of Lord Scales, and became a peer *jure uxoris* in 1462, two years after the death of that nobleman. Being Lord of the Isle of Wight at the time, he was in 1467 appointed one of the ambassadors to treat with the duke of Burgundy, and he exalted his office by challenging the famous Bastard to single fight in what was one of the most famous tournaments of the age. In 1469 Anthony was promoted to be Lieutenant of Calais and Captain of the King's Armada, while holding other honorary posts, and, his father having been beheaded after the battle of Edgecot, he succeeded in August of that year to the earldom. In 1473 he became guardian and governor to the young prince of Wales, and for the next few years there was no man in England of greater responsibility or enjoying more considerable honours in the royal service. It is now that for the first time we become aware of Lord Rivers' literary occupations. His mother, the Duchess, died in 1472, and his first wife in 1473; in 1475 and the following year he went on pilgrimage to the holy places of Italy; from this time forth there was a strong tincture of serious reflection thrown over his character; he was now, as we learn from Caxton, nominated "Defender and Director of the Siege Apostolic for the Pope in England." Caxton had in 1476 rented a shop in the Sanctuary at Westminster, and here had set up a printing-press. The first MS. which he undertook in London was one sent to him by "the noble and puissant lord, Lord Antone, Erle of Ryvyers," consisting of a translation "into right good and fayr Englyssh" of Jean de Teonville's French version of a Latin work, "a glorious

fair mirror to all good Christian people." In 1477 Caxton brought out this book, as *Dictes and Sayengis of the Philosophers*, and it is illustrious as the first production of an English printing-press. To this succeeded the *Moral Proverbs* of Christine de Pisan, in verse, in 1478, and a *Cordial*, in prose, in 1479. The original productions of Lord Rivers, and, in particular, his *Balades against the Seven Deadly Sins*, are lost. In 1478 a marriage was arranged between him and the Princess Margaret, sister of King James III. of Scotland, but it was mysteriously broken off. Rivers began to perceive that it was possible to rise too high for the safety of a subject, and he is now described to us as one who "conceiveth well the mutability and the unstableness of this life." After the death of Edward IV., he became the object of Richard III.'s peculiar enmity, and was beheaded by his orders at Pontefract on the 25th of June 1483. He was succeeded by his son Richard, the third and last earl of the Wydeville family, who died in 1491. Lord Rivers is spoken of by Commines as "un très-gentil chevalier," and by Sir Thomas More as "a right honourable man, as valiant of hand as politic in counsel." His protection and encouragement of Caxton were certainly of inestimable value to English literature, and in the preface to the *Dictes* the printer gives an account of his own relations with the statesman which illustrates the dignity and modesty of Lord Rivers in a very agreeable way. The latter was also one of the purest writers of English prose of his time.

Riverside, a city of California, U.S.A., capital of Riverside county. It is near the southern base of San Bernardino range, on Santa Ana river, and on the Southern California and the Southern Pacific railways, in the southern part of the state, at an altitude of 873 feet. It occupies a level site, has a good water supply and drainage, and is beautifully built up in detached cottages and villas, with ample grounds, containing subtropical plants and trees. The town, which is in a region devoted to the production of oranges, lemons, and other subtropical fruits, and has a large trade in these products, was founded in 1870 by people from New England. Population (1890), 4683; (1900), 7973, of whom 1525 were foreign-born and 195 negroes.

Riviera, the narrow belt of coast which lies between the mountains and the sea all round the Gulf of Genoa in the north of Italy, extending from Nice on the west to Spezia on the east. It is usually spoken of as Riviera di Ponente ("the coast of the setting sun"), the portion between Nice and the city of Genoa; and as Riviera di Levante ("the coast of the rising sun"), the portion from Genoa to Spezia. All this district, being open to the south, and sheltered from the north and east winds, enjoys a remarkably mild climate (winter mean, about 49° Fahr.); so much so that the vegetation in many places partakes of a subtropical character (*e.g.*, the pomegranate, agave, prickly pear, date, palm, and banana). Large numbers of flowers, especially roses, violets, hyacinths, &c., are grown near Nice, Mentone, Bordighera, and other towns, and sent to the London and Paris markets. Bordighera is particularly noted for its noble groves of date-palms, one of the few places in Europe where these trees grow. The uncommon mildness of the climate, conjoined with the natural beauty of the coast scenery—the smother of greenery, the vineyards climbing up the hills, the steep sea-crags, the ruined towers, and in the background the range of the Maritime Alps, often rugged, often snow-capped—attracts thousands of invalids and convalescents to spend the winter in the chain of towns and villages which stretch from the one end of the Riviera to the other. Proceeding from west to east, the following are the places to which visitors principally resort: Nice, Monaco, Monte Carlo, Mentone, Ventimiglia, Bordighera, Ospedaletti, San Remo, Porto Maurizio, Diano Marina, Alassio, Borgio Verezzi, Arenzano (in the Riviera di Ponente), and Nervi, Rapallo, Santa Margherita, Chiavari, Spezia, and San Terenzo (Lerici) in the Riviera di Levante. The Riviera labours, however, under the grave drawback of being liable to earthquakes. In the 19th century there were four such visitations—in 1818, 1831, 1854, and 1887. A railway runs close along the shore all through the Riviera, the distance from Nice to Genoa being 116 miles, and the distance from Genoa to Spezia 55 miles. In the latter stretch the line burrows through the many projecting headlands, which ripple the coast, by means of more than 80 tunnels. Several distinguished men have been born along the Riviera di Ponente—Columbus, Popes Julius II. and Sixtus IV., the Roman emperor Proculus, the Genoese admiral Andrea Doria, the great soldier Masséna, the poet Chiabrera, Paganini the violinist, and Gambetta. Genoa, Sestri Ponente, and Savona, on this same coast, are places of exceptional industrial activity, especially in shipbuilding and other iron industries (see Liguria). The pearl of the eastern Riviera is the stretch (6 to 7 miles) between Rapallo and Chiavari. Lord Byron and Shelley both lived and wrote on the shores of the Gulf of Spezia —and Dickens wrote *The Chimes* at Genoa. Spezia itself is the seat of the chief arsenal and shipbuilding yards of the Italian navy. Francis I. of France was detained for some time at Portofino (peninsula of Rapallo) after being taken captive at Pavia by the Emperor Charles V. in 1525; and in the same neighbourhood is a burial-place of the house of Doria. Lavagna was the ancestral seat of the Fieschi family, known as having produced one Pope, Innocent IV., and from Schiller's play. The women of Rapallo and Santa Margherita are famous lace-makers.

Riviere, Briton (1840- ——), English artist, was born in London on 14th August 1840. His father, William Riviere, was for some years drawing-master at Cheltenham College, and afterwards an art teacher at Oxford. He was educated at Cheltenham College and at Oxford, where he took his degree in 1867. For his art training he was indebted almost entirely to his father, and early in life made for himself a place of importance among the artists of his time. His first pictures appeared at the British Institution, and in 1857 he exhibited three works at the Royal Academy, but it was not until 1863 that he became a regular contributor to the Academy exhibitions. In that year he was represented by "The Eve of the Spanish Armada," and in 1864 by a "Romeo and Juliet." Subjects of this kind did not, however, attract him long, for in 1865 he began, with a picture of a "Sleeping Deerhound," that series of paintings of animal-subjects which has since occupied him almost exclusively. Among the most memorable of his productions are "The Poacher's Nurse" (1866), "Circe" (1871), "Daniel" (1872), "The Last of the Garrison" (1875), "Lazarus" (1877), "Persepolis" (1878), "In Manus Tuas, Domine" (1879), "The Magician's Doorway" (1882), "Væ Victis" (1885), "Rizpah" (1886), "An Old-World Wanderer" (1887), "Of a Fool and his Folly there is no End" (1889), "A Mighty Hunter before the Lord" (1891), "The King's Libation" (1893), "Beyond Man's Footsteps" (1894), now in the National Gallery of British Art; "Phœbus Apollo" (1895, see Plate); "Aggravation" (1896), "St George" (1900), and "To the Hills" (1901). He has also painted portraits; and at the outset of his career made some mark as an illustrator, beginning with *Punch*. He was elected an

Associate of the Royal Academy in 1878, and R.A. in 1881, and received the degree of D.C.L. at Oxford in 1891.

See Sir WALTER ARMSTRONG, "Briton Riviere, R.A.; His Life and Work," *Art Annual*, 1891.

Rivoli, a town in the province of Turin, Piedmont, of Italy, a summer resort of Turin, nine miles west of that city. It has a royal castle, in which King Victor Amadeus II. died a prisoner in 1732; and carries on the manufacture of silks, linens, and woollens. There is also a school of agriculture. Population, about 6000.

Rivoli Veronese, a village in the province of Verona, Venetia, Italy, on a hill on the right bank of the Adige, thirteen miles north-west of Verona. Here, on the 14th of January 1797, Napoleon defeated the Austrians under Alvinczy (Baron von Barberek). A famous street in Paris commemorates the victory, and the village gave the title of Duke to Marshal Masséna.

Road-Making.—Stimulated by the growing demands of vehicular traffic and encouraged by a more liberal expenditure of public money, the art of road-making made substantial progress during the latter part of the 19th century. Questions of foundation being for the time settled, attention was concentrated on the superficial layer, its cost and rate of wear. A perfect pavement would have a surface smooth to the wheel and rough to the hoof. These qualities are not so incompatible as they may seem. In most countries rough pavements have been made smoother, with benefit to both horse and vehicle, and the smoothest might be roughened materially without affecting the rolling wheel. If this process can be carried far enough for safe foothold, the desired roadway will be attained. Foothold should be provided not only at certain places where the shoe may or may not strike or to which it may slide, but wherever the foot may fall. So the modern roadmaker has relied more upon the surface and less upon the joint. Roads of macadam, asphalt, wood, and brick have gained much by recent experiments.

Macadam roads.

If the ideas of the inventor are strictly followed, macadam, when the fine network of joints is thinly masked with hardened mud worn from the stone, comes near to a perfect surface. But stones that will pass through a ring of a given size may be twice as much in length, and unless their form is about that of a cube not exceeding 1¼ inches on its longest side, they cannot be rammed or rolled into the regular mosaic characteristic of the true macadam. The best modern roads are of hand-broken stone dressed slightly on the surface with stone chips, while the mass of the road-metal is kept free from any kind of binding. Some roadmakers, however, have found the large irregularly-shaped stones from the machine so difficult to consolidate that they have had to reconsider the question of binding. The engineer of Central Park, New York, found that, with the greatest care and attention to rolling, such stones would not consolidate properly without admixture; indeed they became more intractable the more they were abraded by rolling. Mr Deacon of Liverpool has advocated a binding composed of large chips of trap rock or else of silicious gravel from the size of three-quarters of an inch down to that of a pin's head, together with about one-fourth part of macadam sweepings obtained in wet weather. This will enable the roller to consolidate the road-metal in a third of the time required for broken stone alone. The harder materials here suggested differ essentially from the sand and dirt formerly used for binding, since they fill up all the vacant spaces and cannot be washed down. Foundations of large and rough hard-core should be rolled down to a surface close enough to keep the finer pieces of road-metal from dropping down, so as to create hollows which, though they may escape the roller, will be detected by the laden wheel and by the pounding of the heavy hoof. But there is no foundation equal to sand, which has the property of spreading pressure over an enlarged area. A 12-inch bed of sand rolled down to 8 inches has been recommended, but military engineers have found that a layer of so little as 3 or 4 inches is sufficient as a foundation for macadam in very bad ground that has been rolled, or on an embankment that has had time to settle.

Tar macadam.

Broken stone mixed with some bituminous composition has been found very suitable for suburban roads, and for towns where the nature of the traffic requires smooth roadways reasonably free from noise and dust. In its simplest form, tar macadam is made from a good hard limestone broken into the usual sizes, the fine chips being used for top-dressing. In a shed a large hearth is formed of stone flagging, under which the flues of a furnace are constructed, and upon the hearth the broken stone is spread in a layer just as thick as the heat may be able to penetrate, to dry off the moisture and make the stones distinctly hot. The load of an ordinary barrow is tipped on an iron plate and gas tar is poured over it (from 8 to 12 gallons per cubic yard), while a couple of men with shovels turn it over exactly as they would turn concrete. No more tar should be used than is required completely to blacken the whole surface of every stone; and when this has been done, the stone can be thrown upon the heap, where it may be kept for one or two months, under cover, to allow the volatile oils to evaporate. Fine siftings are treated in the same way. When it has been properly seasoned, the mass should assume a greenish lustre; and when cut into by a shovel, the particles will cling together and creep down slowly so that the heap is said to be "alive." In that state it may be used. The tar ought to be boiled; and if too thin, a little pitch may be added to it, though not enough to make the heap consolidate. A mixture of tar with pitch and creosote oil is used by more precise makers, one formula being 12 gals. tar, ½ cwt. pitch, and 2 gals. creosote oil to a ton of stone. But those ingredients differ considerably in their chemical composition, and the proportions have to be varied according to experience. Moreover, as regards the tar and pitch used in the manufacture of pavements, the varieties that come directly from a vegetable source are liable to melt in hot and to become brittle in cold weather; coal tar is only moderately proof against these extremes.

Tar macadam must be put down in dry weather. If the material seems too dry, hot tar may be applied as before, but only as an expedient, and with great economy, so that the pavement may not soften in the sun. Upon a well-rolled foundation of hard material a layer of the coarser macadam should be put and rolled, then a layer of the smaller grade. For a road of light traffic a coat of the fine siftings may be put down and heavily rolled to a finished surface. For a road of heavier traffic the second coat should be dressed before rolling with tarred stone of a gauge of three-quarters of an inch to an inch and a quarter, and rolled first with a roller of not more than 10 or 12 cwt., then with one of 30 cwt. After the traffic has been turned on the road for a few days it should again be rolled as heavily as may be necessary to restore any parts that have been disturbed. But such roads are often consolidated by steam-rollers of 10 or 15 tons. For refacing an old road the prongs attached to a steam-roller will easily lift the old layer. Small depressions may be well tarred and levelled up with fine stuff, and the whole surface may be dressed every three years with tar and a fresh coat of fine chips. If the surface of the road is irregular, water will hang upon it, and frost may cause it to become slippery. The lack of affinity between granite

and bitumen prevents the use of tar macadam upon roads of heavy traffic.

Rocks like granite and syenite may be used in combination with Portland cement. The ingredients are mixed in about the proportion of four parts of broken stone that has first been well wetted, one and a quarter or two parts of clean sharp sand, and one of cement put on in two layers, the second being rolled by hand to the required shape and to a good surface. It should remain for two or three weeks to dry and set. Want of elasticity may be urged against concrete macadam, and it is productive of dust, but in some cases it has proved satisfactory.

Concrete macadam.

Smooth rounded gravel is unsuitable for roads unless a large proportion of it is broken, and about an eighth part of ferruginous clay added for binding. Rough pit gravel that will consolidate under the roller may be applied in two or more layers, but each must be of similar composition, or the smaller stuff will work downwards. A gravel road should be always under inspection, and repairs should be done without delay. A track for equestrian exercise should be made of hoggin or fine gravel, that will remain soft when raked or harrowed and watered. It should be well drained. A foundation of rough hard core will let the hoggin pass down into it, so that the hard core will appear at the surface. The best material is rough chalk sufficiently rolled to stop the gravel while draining off the surface water.

Gravel roads.

In Great Britain compressed asphalt for carriage-ways has came into greatly extended use, its perfect suitability for vehicles of all kinds, and its noiselessness under the wheel, being set against its slipperiness, especially when not quite clean. While the road is kept clean, a very slight depression is made by the horse-shoe, which for foothold is a great advantage. The noise made on asphalt by horse-traffic is about the same as that made on hard wood, and is not much more than is necessary for the safety of foot-passengers. In American cities asphalt has been adopted in a totally different form. All asphalt pavements are composed of a very large proportion, perhaps five parts in six, of a hard non-bituminous material. In America it is found cheaper to get the purer bitumen of the island of Trinidad, and to procure in the localities the bulky material required for admixture—a coarse angular sand with a little pure carbonate of lime. An asphaltic cement is made from refined asphaltum. Of this, from 12 to 15 per cent. is used with 70 to 80 per cent. of sand and 5 to 15 per cent. of limestone dust. These materials are heated and stirred together into a stiff mastic paste to form the wearing surface of the road. Upon the concrete foundation is first spread a layer of fine bituminous concrete called "binder," 1½ inches thick, to unite the wearing surface to the concrete foundation. Upon the binder the asphalt is laid to a thickness of 2 inches, being spread with iron rakes and brought to its finished surface by the steam roller. Obviously this is a process requiring great judgment and experience; but the system has become established in America, to the exclusion of European methods. Its great recommendation is the freedom from slipperiness that is said to result from the admixture of sharp sand, and this freedom is really the one quality in which asphalt pavement is seriously deficient. This system has been introduced into England.

Asphalt roads.

The great advance in the use of wood for roadways is due chiefly to the introduction of Australian hard woods, which have to a large extent supplanted fir and pine. The softer woods, which afford reasonably good foothold and are comparatively noiseless, wear rapidly under heavy traffic, and are very liable to decay. Moreover, the wood actually used has been of mixed qualities, and when a block fails, those near it suffer; thus holes are formed, so that the pavement has to be renewed before its time. English oak and beech, which are perhaps too hard, have been used with varying results; but the Australian woods of the genus Eucalyptus have been most extensively tried, and with the most satisfactory results. Those which are best known are jarrah and kauri, but tallow wood, black-butt, blue-gum, red-gum, and spotted-gum, with others, have been tried. Of these, one or two are too dense and hard to afford foothold, others are not easily procured, but jarrah and kauri are used extensively. When cut from the matured heart-wood they are uniform in quality, hard enough for durability, and rough enough to afford fairly good foothold. A very large quantity of wood has been used in London under the name of American red-gum. In substance it comes between the soft and hard woods above mentioned. Wood blocks for paving must be cut with the utmost precision as to the depth of 5 or 6 inches and the breadth of 3 inches. The usual length of 8 or 9 inches should also be kept well enough for bond. A long block is liable to tilt. As to depth, although a slight depression may be of little account, the least projection in a block will be immediately noted as a jolt by the swift-moving wheel. The laying and jointing of wood blocks on concrete is still a matter of experiment. They may be set on a half-inch bed of sand, which is supposed to, though it is doubtful whether it actually does, make the pavement elastic to the tread. If the blocks are not accurately gauged, the sand enables the paviour to adjust them to a uniform surface. But the practice most approved is to pave directly upon the smoothly finished concrete, trusting for elasticity to the wood. On the revival of wood-paving it was thought necessary, for foothold, to leave wide joints filled with small gravel grouted with cement; but this is mischievous. The cement breaks up, and when the blocks shrink, the filling-in is driven downwards, and when they again get wet, they have less room to expand, the side kerbs are driven back, and the foot-pavements are displaced, so as to require relaying. To guard against this, a space of about 2 inches has been left between the pavement and the kerb, to be temporarily filled with clay or sand, which can be cleared out as the pavement expands. But cement has no affinity for wood, and its use, together with the wide joints that were thought necessary to give foothold, has been abandoned. They permitted the edge of the block to be beaten down below the centre, so as to produce a succession of ridges, having much of the character of a "corduroy" road. Asphalted felt placed in the joints has not succeeded. A method very successfully adopted is to leave the end joints slightly open, and to place strips or laths one-tenth of an inch thick between the courses, so that hot pitch can be poured down to fill the joint and cover the surface. The roadway is then strewn with fine sharp gravel. Hard wood blocks so laid expand very slightly, so that a space of an inch and a quarter is sufficient between the kerb and the two courses of blocks that are usually laid parallel to it; this, when filled with pitch, is more than enough to allow for expansion. Paving has been laid with close joints, small vessels of hot pitch being provided, into which each paviour dips the blocks more or less completely before laying them; but wood blocks are more commonly laid dry, a little pitch being brushed over the surface. The gradual abandonment of the wide joints once considered necessary for foothold will be noticed. Soft wood seems to wear under very heavy traffic about five times as fast as hard wood.

Wood pavement.

Since about 1885 brick as a paving for carriage-ways has been adopted to a considerable extent, chiefly in the form of shale bricks, in American cities. The clay is a

hydrated silicate of alumina, containing about 24 per cent. of alumina with 15 per cent. of iron, lime, soda, potash, and magnesia. Lime is injurious, but alkalis to the extent of 3 per cent. are needed to ensure a slight degree of vitrification. Various tests are used for absorption and abrasion. That for abrasion is made by rolling half bricks in an iron barrel or rattler in company with pieces of cast-iron for a given time, and noting the effect on the surfaces, but particularly on the angles, which should be tough enough to resist chipping. Comparisons are also made with test pieces of granite that are mixed with the bricks. To guard against chipping, the best made bricks are pressed over again, and the upper angles rounded to a radius of three-eighths of an inch. Upon a foundation of concrete or well-rolled ballast a cushion or bed of coarse sand from half an inch to three inches thick is laid, and on this the bricks are set. They are then rolled till level, or are heavily rammed, a plank being interposed between the bricks and the rammer. No channel-courses are used. Pitch is poured in at the joints, but by no means on the surface, as that would make them slippery. Brick roadways have stood well under hard wear for fourteen years. Although in the United Kingdom bricks are produced unequalled for hardness and finish, no serious attempt has been made to introduce a tough brick for roadways that will neither chip nor wear smoothly. In various experiments with bricks that seemed most suitable they stood hard traffic for about a year. Clay of absolutely uniform character, and kilns that will ensure perfect equality in firing, are requisite. Slag bricks, made to interlock in the form of a double hexagon, the surface being grooved to a small pattern, have stood good tests for wear and foothold on a perfectly level surface. Many attempts have been made to use compositions, into which asphalt or cement usually enters, for making blocks or slabs, square or hexagonal, that can be laid down on a concrete foundation. A mosaic of macadam set in an iron frame is fixed by running molten slag into the back of the block. Small square pieces of oak are formed into blocks, end-grain upwards. Staffordshire blue bricks, made with holes to hold wooden plugs, have been used with some success. Broad blocks not firmly fixed down usually become loose and tilt when subjected to traffic.

Brick pavements.

Bricks made of cork, granulated and mixed with fibre and asphalt, are also used; they are set in pitch, and seem to be suitable for rather steep gradients. They are comparatively noiseless. For a perfectly noiseless pavement, such as is specially required where a carriage entrance under bedrooms is used by night, no substance is equal to indiarubber. For this purpose it is made in inch sheets about 3 feet wide and as long as the width of the roadway; it is fixed over concrete and secured by iron clips. This arrangement carries the whole of the passenger traffic to St Pancras Station, London, and also a considerable amount of traffic passing under the Euston Square Station Hotel.

Noiseless pavements.

In opening up a new country, roads, temporary or permanent, must be made with such materials as may happen to be at hand. The plank road often used in American forests makes an excellent track for all kinds of traffic. Upon that side of the space devoted to the road, which the heavy traffic leading to a town will use, two parallel rows of sills 15 to 20 feet long, 12 inches wide, and 4 deep, are laid longitudinally flatwise 4 feet from centre to centre, the earth being well packed and rammed to the level of their faces. The joints are not opposite; a short piece of sill is put either under or by the side of each joint. Cross boards about 8 feet 3 inches long and 3 inches thick are laid down loosely, so that groups of four boards together will project on alternate sides of the road 3 or 4 inches, forming a shoulder to enable vehicles to get on to the track at any point. The remainder of the road space is formed as an earthen track, 12 feet wide, for light vehicles. Its slope outwards may be 1 in 16, that of the plank road 1 in 32. If the soil is too bad for the earthen track, short lengths of plank road of double width are made at intervals to form passing places. The cross boards are spiked down on five sills, and are sprung so as to give a fall both ways.

Plank roads.

The log road is formed across swamps by laying young trees of similar length close together. This is ridiculed as a "corduroy" road, but it is better than the swamp. Good temporary roads may be made by laying down half logs roughly squared upon the ground, close together or with spaces between of a couple of inches, into which earth is well rammed. They may be 8 or 9 feet long, alternate logs being made to project a foot on each side for convenience of driving on and off the track.

Log roads.

When fuel is available, good roads can be formed of burned materials. Clay is burned into ballast for foundations, or for a temporary track. In American forests charcoal roads have been largely used. Logs from 6 inches to 2 feet in diameter are piled along the whole route, the stack being 9 feet broad at the base, 6 feet high and 2 feet broad at the top. Dry materials for lighting are intermixed, and the stack is covered up with sods and earth from the side ditches. When burned, the charcoal is simply raked down so as to form a 15-foot road of a well-rounded section. These roads are dry and hard, and otherwise satisfactory.

Charcoal roads.

The mode of carrying a road across a bog upon a foundation of faggots or brushwood is well known. In India the native roads have been made equal to heavy traffic by laying branches of the Mimosa across the track. And in the great plains, where the soil, when dry, would otherwise be made deep in dust, this is entirely prevented by laying across the track a coarse reed or grass like the Pampas grass, and covering it with 3 or 4 inches of loam.

In carrying traffic over a clay soil a covering of 3 or 4 inches of coarse sand will entirely prevent the formation of the ruts which would otherwise be cut by the wheels; and if the ground has already been deeply cut up, a dressing of sand will so alter the condition of the clay that the ridges will be reduced by the traffic, and the ruts filled in.

Sand.

Roanne, chief town of arrondissement and an important railway junction, department of Loire, France, 50 miles north-north-west of St Étienne, on the railway from Paris to St Étienne. The making of knitted articles gives employment to about 3000 women and girls in the surrounding districts. There are besides extensive engineering workshops, iron and copper foundries, numerous dyeworks, and pottery and tile works. Population (1881), 24,274; (1901), 33,775.

Roanoke, a city of Virginia, U.S.A. Though within the limits of Roanoke county, it is not subject to county government. It is situated on the Roanoke river, in the south-western part of the state, at an altitude of 907 feet. It has an excellent water system and sewerage. Situated on the main line of the Norfolk

and Western Railway, at the junction of two branches, its industries are connected with the manufacture of iron and steel. It has blast furnaces, rolling mills, foundries, locomotive and car works, and other manufactures. Formerly known as the town of Big Lick, it was chartered under its present name in 1884. Population of Big Lick (1880), 669; of Roanoke (1890), 16,159; (1900), 21,495, of whom 539 were foreign-born and 5834 negroes.

Roberts, Frederick Sleigh, Earl (1832–——), British Field Marshal and Commander-in-Chief, K.G., second son of General Sir Abraham Roberts, G.C.B., was born at Cawnpore, India, on 30th September 1832. Educated at Eton, Sandhurst, and Addiscombe, he obtained a commission in the Bengal Artillery on 12th December 1851. In the following year he was posted to a field battery at Peshâwar, where he also acted as aide-de-camp to his father, who commanded the Peshâwar division. In 1856 Roberts was appointed to the Quartermaster-General's department of the Staff, in which he remained for twenty-two years, passing from one grade to another until he became Quartermaster-General in India. On the outbreak of the Mutiny in 1857, Roberts, at first, was staff officer to the movable column operating against the mutineers in the Punjab, successively commanded by Colonels Neville Chamberlain and John Nicholson, but, towards the end of June, he joined the Delhi Field Force, and was Deputy Assistant Quartermaster-General with the artillery during the operations against Delhi. He was wounded in the fight of the 14th July, but was sufficiently recovered in September to take command as a regimental officer of the left half of No. 2 Siege Battery during the siege. He rejoined the headquarters staff for the assault, and took part in the storm and subsequent seven days' fighting in the city. He then accompanied Colonel Greathed's column to Cawnpore, and during September and October was present at the actions of Bulandshahr, Aligarh, Agra, Banthira, and Kanoj. He served under Sir Colin Campbell at the second relief of Lucknow in November, at the battle of Cawnpore on the 6th December, and the subsequent pursuit and defeat of the Gwalior Contingent near Sheorajpur. Roberts distinguished himself at the engagement of Khudaganj, on the 2nd January 1858, by capturing, in single-handed combat, a standard from two sepoys, and also by cutting down a sepoy about to kill a sowar. For these acts of gallantry he was recommended for the Victoria Cross. He was present at the reoccupation of Fatehgarh on the 6th January, the storm of Mianganj in February, the siege and capture of Lucknow in March, and the action at Kursi on the 22nd of that month, after which he went home on sick leave. For his services in the Mutiny war he was seven times mentioned in despatches, received the medal with three clasps, the Victoria Cross, and on his promotion to captain in October 1860, a brevet majority. On the 17th of May 1859 he married, at Waterford, Miss Nora Bews, and on his return to India was entrusted with the organization of the Viceroy's camps during the progresses through Oudh, the North-West Provinces, the Punjab, and Central India in 1860 and 1861. In December 1863 he took part, under Major-General Garvock, in the Umbeyla campaign among the mountains to the north of Peshâwar, and was present at the storm of Lalu, the capture of Umbeyla, and the destruction of Mulka, receiving for his services the medal and clasp.

FIELD MARSHAL EARL ROBERTS, K.G.
(From a photograph by Elliott and Fry, London.)

In 1867 Roberts was appointed Assistant Quartermaster-General to Sir Donald Stewart's Bengal Brigade for Abyssinia. He showed judgment in embarking each unit complete in every detail, instead of despatching camp equipage in one ship, transport in another, and so on, as was customary. He arrived at Zula, Annesley Bay, in the Red Sea, the base of the expedition, on 3rd February 1868, and remained there as senior base staff officer during the four months' campaign. At its close he superintended the re-embarkation of the whole army. His duties were so well performed that Sir Robert Napier sent him home with his final despatches. He was three times "mentioned," and received a brevet lieutenant-colonelcy and the war medal. He returned to India the following year as First Assistant Quartermaster-General. In the autumn of 1871 he made the arrangements for the expedition into Lushai, between south-east Bengal and Burma, fitted out two columns under Brigadiers-General Bourchier and Brownlow, and himself accompanied the first. A road, over 100 miles long, was cut through dense gloomy forests in stifling heat, and the column was attacked by cholera; but the object of the expedition was successfully accomplished, and Roberts, who was present at the capture of the Kholel villages and the action in the Northlang range, and commanded the troops at the burning of Taikum, was mentioned in despatches and made a Companion of the Bath. On his return in March 1872, he became Deputy Quartermaster-General in Bengal, and in 1875 Quartermaster-General and Colonel. He settled the details of the great camp of exercise at Delhi on the occasion of the visit of the Prince of Wales in January 1876, and attended H.R.H. at the manœuvres. He also superintended the arrangements for the great durbar at Delhi on 1st January 1877, when Queen Victoria was proclaimed Empress of India.

In 1878 Roberts was appointed to the command of the Frontier Field Force at Abbottabad, in Hazara; but in the autumn, on the repulse of the Chamberlain Mission by the Afghans, and the formation of three columns to advance

into Afghanistan by the Khaibar, the Bolan, and the Kuram passes, he was given the command of the Kuram Field Force, with the rank of Major-General. Concentrating his column at Thal, he advanced to Kuram towards the end of November, and having formed an advanced base there, moved on to Habib Kila. Under cover of preparations for a front attack on the Peiwar Kotal, he reconnoitred that formidable position, and on the night of the 1st December moved part of his force to attack the Spingawi Kotal, in order to turn the Afghan left flank, leaving the remainder of the force to feign a front attack on the Peiwar, and to guard the camp. After a very difficult night march the Spingawi Kotal was carried at daybreak on the 2nd, and, later, the Afghans on the Peiwar Kotal, threatened in rear, abandoned the position. The next morning Roberts occupied the Peiwar, and on the 6th advanced to Ali Khel. He reconnoitred the Shutargardan and the Sapari passes, and made a strong reconnaissance through Khost, in which some fighting took place, and at the end of January returned to Hagir Pir, in Kuram, where his force remained in occupation. In July, Major Cavagnari, the British envoy to the new Amir, Yakub Khan, passed through Kuram on his way to Kabul, and, shortly afterwards, Roberts left his Kuram command and went to Simla to take his seat on the Army Commission, where he strongly advocated the abolition of the three Presidency armies, and the substitution for them of four army corps, a measure which was carried out sixteen years later. While he was at Simla, news arrived on 5th September of the murder of Cavagnari and his companions at Kabul. The Peshawar Valley Force had been broken up; Sir Donald Stewart was still at Kandahar, but most of his troops had started for India; Roberts, therefore, had the only force ready to strike rapidly at Kabul. It was hastily reinforced, and he hurried back to Kuram to take command, as a Lieutenant-General, of the Kabul Field Force (7500 men and 22 guns). By the 19th September a brigade was entrenched on the Shutargardan, and as Roberts advanced, the Amir Yakub Khan came into his camp. An Afghan force of 8000 men blocked the way in a strong position on the heights beyond Charasia, and on 6th October Roberts repeated the tactics that had done him such good service at the Peiwar in the previous year, and sending Brigadier-General T. D. Baker with the greater part of his force to turn the Afghan right flank, threatened the pass in front with the remainder. By the afternoon Baker had seized the position, and the enemy, severely defeated, were in full retreat. Kabul was occupied without further opposition.

The city was spared, but punishment was meted out to those convicted of complicity in the murder of the British Mission. Yakub Khan abdicated on the 12th October, and was eventually deported to India. The troops occupied the Sherpur cantonments; but in November a religious war was proclaimed by the Mullahs, and early in December, in order to prevent a threatening combination of Afghan tribes against him, Roberts moved out two columns to attack them in detail. After considerable fighting around Kabul, the numbers of the enemy were so great that he was forced to concentrate his troops again at Sherpur, the defences of which had been greatly improved and strengthened. Sherpur was invested by the enemy, and early on the 23rd December was attacked by over 100,000 Afghans. They were driven off with great loss; and on making a second attempt to storm the place, were met by Roberts, who moved out, attacked them in flank, and defeated them, when they broke and dispersed. Roberts now recommended the political dismemberment of Afghanistan, and negotiations were carried on with the northern tribes for the appointment of an Amir for the Kabul district only. On the 5th May Sir Donald Stewart arrived with his column from Kandahar and assumed the supreme command in Afghanistan, Roberts retaining, under Stewart, the command of the two Kabul divisions, and organizing an efficient transport corps under Colonel R. Low, which was soon to be of inestimable value. On the 22nd of July Abdur Rahman was proclaimed Amir of Kabul; and Roberts was preparing to withdraw his troops to India by the Kuram route, when news arrived that a British brigade had been totally defeated at Maiwand on the 27th July, and that Lieutenant-General Primrose was besieged in Kandahar. Roberts was ordered to proceed thither at once with a specially selected column of 10,000 troops and his new transport corps. He started on his famous march on the 9th August and arrived at Kandahar on the morning of the 31st, having covered 313 miles in twenty-two days. On the following day he fought the battle of Kandahar and gained a complete victory. His services in the Afghan campaigns of 1878 to 1880 are recorded in eight *Gazettes*, and were recognized by the thanks of both Houses of Parliament, of the Government of India, and of the Governor-General in Council. He was created K.C.B., G.C.B., and a baronet, received the medal with four clasps, and the bronze star, and was given the command of the Madras army.

Before proceeding to Madras, Roberts went home on furlough, and when the news of the disaster at Majuba Hill in South Africa arrived in London at the end of February 1881, he was appointed Governor of Natal and Commander-in-Chief in South Africa. He arrived at Cape Town to find that peace had been made with the Boers, and that instructions were awaiting him to return home. The same year he attended the autumn manœuvres in Hanover as the guest of the German Emperor. He declined the post of Quartermaster-General to the Forces in succession to Sir Garnet Wolseley, and returned to India, arriving at Madras in November. The following year he visited Burma with the Viceroy, and in 1885 attended the meeting between Abdur Rahman and Lord Dufferin at Rawalpindi at the time of the Pendjeh incident, in connexion with which he had been nominated to the command of an army corps in case of hostilities. In July he succeeded Sir Donald Stewart as Commander-in-Chief in India, and during his seven years' tenure of this high position instituted many measures for the benefit of the army, and greatly assisted the development of frontier communications and defence. At the end of 1886, at the request of the Viceroy, he took personal command for a time of the forces in Burma, and organized measures for the suppression of dacoity. For his services he received the medal, was created G.C.I.E., and promoted Supernumerary General. In 1890 he did the honours of the army to Prince Albert Victor at a standing camp at Muridki, and in 1891 his attention was occupied with the Zhob and Hunza Naga frontier campaigns. On the 1st January 1892 he was raised to the peerage as Baron Roberts of Kandahar and Waterford. In 1893 he left India for good, and the G.C.S.I. was bestowed upon him. He was promoted to be Field Marshal in 1895, and in the autumn of that year succeeded Lord Wolseley in the Irish command and was sworn a Privy Councillor. At Queen Victoria's Diamond Jubilee in 1897 he was created K.P.

After the disastrous actions in the Boer war in South Africa in December 1899 at Magersfontein, Stormberg, and Colenso, where his only son was killed, Lord Roberts was sent out as Commander-in-Chief. He arrived at Cape Town on the 10th January 1900, and after organizing his force, advanced with sound strategy on Bloemfontein, the capital of the Orange Free State, and soon changed the aspect of affairs. The sieges of Kimberley and Ladysmith were raised, and the Boer General, Cronje, flying towards the capital, was overtaken at Paardeberg and, after a fine defence, compelled to surrender, with 5000 men, on

the anniversary of Majuba Day, the 27th February 1900. Roberts entered Bloemfontein on the 13th March, and after six weeks' preparation, advanced on Pretoria, the capital of the Transvaal. Mafeking was relieved on the 17th May, and Pretoria occupied on the 5th June. The two Boer states were annexed, and the war gradually assuming a guerilla character, Roberts handed over the command to Lord Kitchener, and returned to England to fill the office of Commander-in-Chief of the Army in succession to Lord Wolseley.

He arrived in the Solent on the 2nd January 1901, and the same day, at Osborne, had an audience of Queen Victoria, who handed him the insignia of the Order of the Garter. The next day he was received at Paddington by the Prince and Princess of Wales, and drove in procession to Buckingham Palace, where he was entertained as the guest of the Queen. He again had an audience of the Queen at Osborne on the 14th January on his elevation to an earldom, the last audience given by Her Majesty before her death, which took place eight days later. When the German Emperor came to London for the Queen's funeral, he decorated Lord Roberts with the Order of the Black Eagle. Earl Roberts received the thanks of both Houses of Parliament and a grant of £100,000 for his services in South Africa. He is the author of *The Rise of Wellington*, 1895, and *Forty-one Years in India*, 1897, which has passed through more than thirty editions.

Robertson, George Croom (1842–1892), Scottish philosopher, was born at Aberdeen on 10th March 1842. In 1857, when only fifteen, he gained a bursary at Marischal College, and graduated as M.A. in 1861, with the highest honours in classics and philosophy. In the same year he won a Fergusson scholarship of £100 a-year for two years, which enabled him to pursue his studies outside Scotland. He first went to University College, London; thence to Heidelberg, where he worked at German; and to Berlin, where he studied psychology and metaphysics; also physiology under du Bois-Reymond, and heard lectures on Hegel, Kant, and the history of philosophy, ancient and modern. He then spent two months at Göttingen; and in June 1863 went to Paris. In the same year he returned to Aberdeen and helped Professor Bain with the revision of some of his books. In 1864 Croom Robertson was appointed to help Professor Geddes with his Greek classes, but he gave up the vacations to philosophical work. In 1864 he wrote an article on German philosophy for the *British and Foreign Evangelical Review*, and one on Kant and Swedenborg for *Macmillan's Magazine*. In 1866 he was appointed Professor of Philosophy of Mind and Logic at University College, London. This post he retained until ill-health compelled him to resign, a few months before his death in 1892. Professor Robertson lectured on logic, deductive and inductive, systematic psychology, and ethical theory. He was a most industrious worker and accumulated large stores of materials, but left little published work. He had projected a comprehensive work on Hobbes; but this was never completed, though part of the materials were used for an article in the *Encyclopædia Britannica*, and another portion was published as one of Blackwood's "Philosophical Classics." Together with Professor Bain, he edited Grote's *Aristotle*; and he was the editor of *Mind* from its foundation, in 1876, till 1891. He was keenly interested in German philosophy, and took every opportunity of making German works on English writers known in the United Kingdom. In philosophy his affinities were chiefly with the school represented by Mill and Bain, but he was widely acquainted with the philosophical literature of all schools. He was associated with his wife (a daughter of Mr Justice Crompton) in many kinds of social work; he sat on the Committee of the National Society for Women's Suffrage, and was actively associated with its President, John Stuart Mill. He warmly supported the admission of women students to University College.

Robilant, Count Nicolas Carlo Felice (1826–1888), Italian soldier and diplomatist, was born at Turin on 8th August 1826. Entering the army as artillery lieutenant in 1845, he was wounded at the battle of Novara, where he lost a hand. In 1860 he took part in the campaign in the Marches, and during the war of 1866 was chief of staff of the 3rd Army Corps. After serving on the Italo-Austrian Frontier Commission, and acting as Prefect of Ravenna at a critical moment in 1869, he was sent to Vienna in June 1871, first as minister and afterwards as ambassador. While approving of the *rapprochement* between Italy and the Central Powers, he opposed the visits of Victor Emmanuel II. to Vienna and Berlin in 1874, and that of King Humbert to Vienna in 1881, since he desired that the Triple Alliance should only be concluded after the Austrian Emperor should have recognized Italian Unity by returning at Rome the visit of the Italian Sovereign to the Austrian capital. Reluctantly accepting the portfolio of Foreign Affairs in 1886, he displayed tact and firmness during the Bulgarian crisis of that year; and before leaving the Foreign Office, after the disaster to Italian troops at Dogali, in Abyssinia, he succeeded (March 1887) in renewing the Triple Alliance on terms more advantageous to Italy than those of the original treaty, and in supplementing it by an understanding with Great Britain in regard to Mediterranean affairs. After his fall from power he re-entered the regular army, but was selected by Crispi for the post of Ambassador to London, where he died on 17th October 1888. (H. W. S.)

Rochdale, a municipal, county (1888), and parliamentary borough of Lancashire, England, on the Roch, 196 miles north-west of London by rail. The corporation acquired powers in 1900 to purchase the tramways and to replace them by electric lines. The electric light has also been recently introduced. Several new mills, board schools, and other buildings have been erected. Specially noticeable are the technical school (1893), costing £15,000; a school of art (1889), and a Roman Catholic orphanage. There is a statue of John Bright (1891). The Equitable Pioneers Society (1844), pioneer of co-operation, numbers over 11,000 members, with a capital of over £350,000. A handsome new co-operative store, belonging to the Rochdale Provident Co-operative Society, was opened in 1900. In 1891, 5699 males and 8353 females were engaged in the cotton, 1860 males and 2107 females in the wool and worsted, and 591 males and 395 females in the silk manufacture; and 1423 persons in the making of machines. Area of parliamentary borough, 4185 acres; population (1881), 68,866; (1891), 71,401. Till November 1900 the municipal and county borough was coincident with the parliamentary borough; it was then, however, extended to include the urban district of Castleton, and now has an area of 6454 acres with a population in 1901 of 83,112.

Rochefort, chief town of arrondissement, department of Charente Inférieure, France, 20 miles south-south-east of Rochelle, on the railway from Nantes to Bordeaux. Manufactures include tiles and drain pipes, preserved foods, artificial fuel, and steam saw and planing mills. Large quantities of wine are produced in the districts around Rochefort and Tonnay-Charente, amounting in 1899 to 28,963,700 gallons. The third floating basin of the commercial port was completed in 1890; it has an area of 15 acres, with 3692 feet of quayage, and a depth, spring

and neap tides respectively, of 29½ and 25½ feet. Exclusive of coasting trade, the number of vessels entered at Rochefort and Tonnay-Charente in 1900 was 151 of 117,284 tons; cleared, 130 of 105,359 tons. The total movement, including coasting trade, amounted to 339,582 tons. At TONNAY-CHARENTE (4 miles to the north), in the same year, the total tonnage, including coasting trade, amounted to 218,225. A "bridge with suspended carrier" has been constructed across the Charente between Rochefort and the sea, at a height which admits of the tallest ships passing underneath at any time. The "carrier," suspended some 150 feet below the bridge, but above the highest water-line, conveys persons, animals, goods, and vehicles from side to side, a distance of 300 or 400 yards. This bridge was completed at a cost of about £28,000. Population (1881), 21,608; (1901), 31,613. Tonnay-Charente: population (1901), 4640.

Rochefort, Victor Henri, Marquis de Rochefort-Luçay (1830-——), French journalist and politician, generally known as Henri Rochefort, the son of a Legitimist noble, was born 30th January 1830, at Paris. He was successively in early life a medical student, a clerk in the Hôtel de Ville, a successful playwright, and a journalist. When one of the writers of the *Charivari*, his articles led to his appointment as sub-inspector of Fine Arts in Paris, but this post he resigned in 1861. In 1863 he joined the staff of the *Figaro*, at a salary of 30,000 francs; but his severe comments on the Second Empire brought the paper into collision with the authorities, and led to his retirement. His articles were collected and published in three volumes, entitled *Les Français de la Décadence*. Rochefort now founded *La Lanterne*; but it was seized on its eleventh appearance, and in August 1868 the editor was fined 10,000 francs, with a year's imprisonment. The publication was afterwards rigorously suppressed. Rochefort fled to Belgium; and after two unsuccessful candidatures, he was returned to the Chamber of Deputies by the Ultra-Democrats of the first *circonscription* of Paris. After a brief arrest on crossing the frontier, he took his seat. He attacked the Imperial régime violently in the Chamber; and in 1869 started a new paper, the *Marseillaise*, in which Victor Noir and Pascal Grousset were collaborators. The attacks in this journal on Prince Pierre Bonaparte led to the killing of Victor Noir by the Prince; the paper was seized, and early in 1870 Rochefort and Grousset were fined, and committed to prison for six months. Upon the downfall of the Empire in September 1870 Rochefort was released by the mob, and for a short time he became connected with the Government of National Defence; but was compelled to resign on account of his open sympathy with the first Communistic outbreaks. When the Commune was established in March 1871 Rochefort at first supported its terrible excesses in the *Mot d'Ordre*, but finding its tyranny insupportable, he fled from Paris in disguise on 11th May. Arrested by the Versailles Government, he was condemned by martial law to imprisonment for life, and notwithstanding Victor Hugo's efforts to procure his release, he was transported to New Caledonia. In November 1872 he was temporarily released to enable him to legitimize his children by marrying their mother, who was dying. Then he was reconveyed to New Caledonia, whence he escaped in 1874 in an open boat. He made his way to San Francisco, and thence to London and Geneva, where he contributed to the Parisian press, and attempted to revive *La Lanterne*, but without success. After being severely wounded in a duel, —a form of hostility in which he was always conspicuous, —he took advantage of the general amnesty to return to Paris, where he founded a new journal called *L'Intransigéant*. He resumed his assaults upon all the French Governments in turn. He also attacked with special incisiveness the Tunis expedition, which he declared to be a mere stock-jobbing affair; and he secured a triumphant acquittal in an action for libel brought against him by M. Roustou, the Resident at Tunis, who had been the chief promoter of the annexation. During the Boulangist fever he was a staunch partisan of the General, whom he accompanied to England in 1889, having escaped through Belgium from France. Rochefort remained in exile in England for some years, and was always hospitably received there. In January 1895 a French Amnesty Bill was passed by the Chamber, and Rochefort, with many other proscribed persons, took immediate advantage of it and returned to Paris. He played a prominent part against ex-Captain Dreyfus during his second trial at Rennes. In 1900, during the course of the South African war, he initiated a movement in France on behalf of the Boers, and no words in his vocabulary were too insulting for the country which had so long given him refuge.

Rochelle, La, chief town of department Charente Inférieure, France, 293 miles south-west of Paris, on the railway from Nantes to Bordeaux. The new Parc Charruyer lies outside the fortifications west of the town. Local institutions include an academy of belles-lettres and science. Shipbuilding, the manufacture of briquettes, chemicals, sardine- and tunny-preserving, and petroleum-refining are among the principal industries. The maritime commerce, included with that of LA PALLICE, is very important. La Pallice, the new port of La Rochelle, inaugurated 1890, is situated nearly 4 miles to the south-west on the ocean, and is defended by a fort. At La Pallice petroleum refineries and chemical manure works have been established, and it has a repairing shipyard. Its importance, however, centres in its magnificent port, entirely artificially excavated, which, sheltered by the islands of Ré and Oléron, affords excellent and safe anchorage in all weathers. The outer part, protected by two jetties, respectively 1420 and 2054 feet in length and each terminated by a lighthouse, has an area of 29 acres and depth 16½ feet below lowest tide level. Ships drawing up to 16 feet can enter at any time, and those drawing from 16 to 26 feet during six hours daily. At the extremity of the breakwater is a wharf 680 feet long where ships may discharge without entering the basin. A lock 770 feet long and 72 feet wide connects with the inner basin, which has an area of 27 acres, with 5900 feet of quayage, a minimum depth of 28 feet, and depths of 29½ feet and 36 feet at high neap and spring tides. Connected with the basin are two graving docks, respectively 616 and 364 feet in length, with depths ranging between 23 and 30 feet. The number of vessels entered at La Pallice in 1900 was 205, of 317,080 tons; cleared 200, of 305,220 tons. At La Rochelle basin 207 vessels entered, of 139,695 tons; cleared 169, of 123,267 tons. Including coast trade, the total movement for the two ports amounted to 2,215,210 tons. The total value of the imports at La Rochelle was, in 1899, £2,556,000, and of the exports, £1,020,000, chiefly brandy (5103 tons). Belonging to the port in 1899 were 253 vessels of 23,520 tons, mostly small sailing ships. In 1900, 198 sailing boats, manned by 743 persons, were engaged in the fisheries. The fish market of La Rochelle is the most important on the west coast. The value of fish sold in 1900 was £154,240. Population (1881), of La Rochelle, 17,234; (1901), 28,578.

Rochester, an episcopal city and municipal and parliamentary borough, Kent, England, in the Medway parliamentary division of the county, on the Medway, 33 miles

east of London by rail. The restoration of the west front of the cathedral (Norman style) was commenced in 1888 by Dean Hole, and was completed about 1898, costing, with other work, £7358. The church of St Nicholas was restored in 1892. A museum was opened in 1894 in the basement of the corn exchange, and a handsome Elizabethan mansion has been acquired by the corporation for museum purposes, as a memorial of Queen Victoria's Diamond Jubilee. In 1888, 9680 vessels entered the port with 704,207 tons of cargo, and 9290 cleared with 659,233 tons. In 1901, 1540 vessels entered with 386,879 tons, and 1567 vessels cleared with 392,872 tons. The population of the municipal and parliamentary borough was in 1891, 26,290; in 1901, 30,622. The parish of Strood lies mainly within the borough, and is connected with the city by a bridge. Population (1901), 14,432.

Rochester, a city of Minnesota, U.S.A., the capital of Olmstead county. It is on the Zumbro river, and on the Chicago and North-Western and the Winona and Western railways, in the south-eastern part of the state, at an altitude of 991 feet. It contains one of the state insane asylums, and is in the midst of a fertile farming region, with grain elevators and flour-mills, utilizing the water-power furnished by the river. Population (1890), 5321; (1900), 6843, of whom 1680 were foreign-born.

Rochester, a city of Strafford county, New Hampshire, U.S.A. It is on Salmon Falls and Cocheco rivers, and at the junction of several branches of the Boston and Maine Railroad, in the south-eastern part of the state, at an altitude of 226 feet. It has fine water-power, and manufactures of boots and shoes, woollen goods, and other articles. Rochester was settled in 1728, incorporated as a town in 1737, and received a city charter in 1891. Population (1890), 7396; (1900), 8466, of whom 1651 were foreign-born.

Rochester, a city of New York, U.S.A., the capital of Monroe county. It is on both banks of the Genesee river, in the north-western part of the state. The plan of the city is irregular, with broad, well-shaded streets, a large proportion of which are paved, mainly with asphalt. It has a fine water-supply and is well sewered. It is the seat of Rochester University, which in 1899 had a faculty numbering 15 and was attended by 213 students. Rochester is a lake port, the river being navigable to this point. It is also a railway centre of great importance, being entered by seven railways, the Buffalo, Rochester, and Pittsburg, the Erie, the Lehigh Valley, the New York Central and Hudson River, the Rochester and Lake Ontario, the Western New York and Pennsylvania, and the West Shore, which afford internal communication in all directions. Rochester is a manufacturing city of much importance, aided by water-power derived from the falls. In 1900 it contained 2616 manufacturing establishments, with a total capital of $49,086,212. These employed 33,408 hands and paid $13,832,122 in wages. The raw materials had a value of $31,557,122, and the finished product of $69,129,820. The principal of these products, with their values, were as follows:—

Boots and shoes	$6,933,111
Men's clothing	11,138,220
Flouring and grist mill products	3,010,539
Foundry and machine-shop products	4,036,479
Malt liquors	2,748,290
Tobacco	3,040,331
Furniture	2,069,972

The assessed valuation of real and personal property was, in 1900, $115,570,890, the net debt of the city was $10,574,431, and the tax-rate was $24.29 per $1000. The total municipal receipts, apart from loans, were $4,336,506, and the expenditures for maintenance and operation, $3,645,343. Population (1890), 133,896; (1900), 162,608, of whom 40,748 were foreign-born and 601 negroes. Of 45,395 males 21 years of age and over, 1327 were illiterate (could not write).

Rockaway, formerly a village of Queens county, New York, U.S.A., but since 1st January 1898 a part of the borough of Queens, one of the five boroughs of which New York City is composed. It is a summer resort, situated on a sandbar on the south coast of Long Island.

Rockford, a city of Illinois, U.S.A., the capital of Winnebago county. It is situated in 42° 15′ N., 89° 5′ W., on Rock river, which furnishes a fine water-power, in the northern part of the state, at an altitude of 714 feet. The city has an excellent water-supply from artesian wells and from the river; its business streets are paved with brick, wood, and asphalt, and many of its residential streets are macadamized. It is upon four railways, the Chicago, Burlington, and Quincy, the Chicago and North-Western, the Chicago, Milwaukee, and St Paul, and the Illinois Central, which give it a large trade. In manufactures, the census of 1900 reported that the city contained 450 establishments, with a total capital of $14,126,834, employing 6620 hands, and with a product valued at $12,586,116. The principal articles of manufacture were furniture, knitted goods, foundry and machine-shop products, and agricultural implements. In 1900 the assessed valuation of property, real and personal, was $5,266,804, a very low assessment. The net debt of the city was $565,134, and the rate of taxation was $60.75 per $1000. Population (1890), 23,584; (1900), 31,051, of whom 9337 were foreign-born and 212 negroes. Of 8856 males 21 years of age and over, 129 were illiterate (could not write).

Rockhampton, a town of Queensland, Australia, in the county of Livingstone, on the Fitzroy river, about 420 miles north-west of Brisbane. It has frequent communication by steamer with the principal Australian ports, and is the outlet for a wide agricultural district, which produces also gold and copper. The value of the exports in 1899 amounted to £2,390,000. Much of the trade is carried on through the ports of Alma and Broadmount, near the mouth of the river, both available for ocean steamers. The Central Railway starts from this town. Population (1891), 11,629; (1901), 15,461. North Rockhampton is a separate municipality on the opposite side of the river. Population (1901), 2865.

Rock Hill, a city of York county, S.C., U.S.A. It is situated on the Southern and the South Carolina and Georgia railways, in the northern part of the state. Population (1890), 2744; (1900), 5485, of whom 33 were foreign-born and 1706 negroes.

Rock Island, a city of Illinois, U.S.A., the capital of Rock Island county. It is situated in 41° 32′ N., 90° 31′ W., on the east bank of the Mississippi, in the western part of the state, at an altitude of 570 feet at the river bank. The city has a water-supply pumped by the Holly system, is sewered, and is divided into seven wards. It has five railways, the Chicago, Rock Island and Pacific, the Chicago, Burlington, and Quincy, the Chicago, Milwaukee, and St Paul, the Davenport, Rock Island, and North-Western, and the Rock Island and Peoria. The city has a large trade by rail and river, and, aided by ample water-power derived from the Rock Island Rapids, it has important manufactures, including flour, lumber, glass, and agricultural implements. Rock Island is the seat of Augustana College, a Lutheran institution, opened in 1860, which in 1899 had a faculty numbering 27 and was attended by 458 students. Popu-

lation (1890), 13,634; (1900), 19,493, of whom 4412 were foreign-born and 282 negroes.

Rockland, a city and seaport of Maine, U.S.A., the capital of Knox county. It is on the shore of Penobscot bay, and on a branch of the Maine Central Railroad, in the southern part of the state. It is divided into seven wards, and has a water-supply and sewer system. The principal industries are the quarrying of granite, the burning of lime, and shipbuilding. Owing to its strength and durability, Rockland granite is used for building in various parts of the country. Population (1890), 8174; (1900), 8150, of whom 610 were foreign-born.

Rockland, a town of Plymouth county, Massachusetts, U.S.A. It is an inland town in the south-eastern part of the state, on a branch of the New York, New Haven, and Hartford Railroad. It contains an area of 11 square miles, well settled, mainly with rural population. There is a village bearing the same name as the town. Population (1890), 5213; (1900), 5327, of whom 796 were foreign-born.

Rockport, a town of Essex county, Massachusetts, U.S.A. It is at the eastern point of Cape Ann, in the north-eastern part of the state, on a branch of the Boston and Maine Railroad. It has an area of seven square miles of broken, rocky country, bordered by a rugged coast-line. It contains several villages, Rockport, Ocean View, and Pigeon Cove, which are popular seaside resorts. Rockport is widely known for its granite quarries. Population (1890), 4087; (1900), 4592, of whom 1290 were foreign-born.

Rockville, a city of Tolland county, Connecticut, U.S.A. It is on the Hockanum river, and on the New York, New Haven, and Hartford Railroad, in the northern part of the state, at an altitude of 403 feet. It possesses excellent water-power, which has been put to use in manufactures. These consist largely of envelopes and woollen and silk goods. Rockville was separated from Vernon town and chartered as a city in 1889. Population (1890), 7772; (1900), 7287, of whom 2548 were foreign-born.

Rodin, Auguste (1840-——), French sculptor, was born in 1840, in Paris, and at an early age displayed a taste for his art. He began by attending Barye's classes, but did not yield too completely to his influence. From 1864 to 1870, under pressure of necessity, he was employed in the studio of Carrier-Belleuse, where he learnt to deal with the mechanical difficulties of a sculptor. Even so early as 1864 his individuality was manifested in his "Man with a Broken Nose." After the war, finding nothing to do in Paris, Rodin went to Brussels, where from 1871 to 1877 he worked, as the colleague of the Belgian artist Van Rasbourg, on the sculpture for the outside and the caryatides for the interior of the Bourse, besides exhibiting in 1875 a "Portrait of Garnier." In 1877 he contributed to the Salon "The Bronze Age," which was seen again, cast in bronze, at the Salon of 1880, when it took a third-class medal, was purchased by the State, and placed in the gardens of the Luxembourg. Between 1882 and 1885 he sent to the Salons busts of "Jean-Paul Laurens" and "Carrier-Belleuse" (1882), "Victor Hugo" (see Plate) and "Dalou" (1884), and "Antonin Proust" (1885). From about this time he chiefly devoted himself to a great decorative composition six metres high, which was not finished for twenty years. This is the "Portal of Hell," the most elaborate perhaps of all Rodin's works, executed to order for the Musée des Arts Décoratifs. It is inspired mainly by Dante's *Inferno*, the poet himself being seated at the top, while at his feet, in under-cut relief, we see the writhing crowd of the damned, torn by the frenzy of passion and the anguish of despair. The lower part consists of two bas-reliefs, in their midst two masks of tormented faces. Round these run figures of women and centaurs. Above the door three men cling to each other in an attitude of despair. After beginning this Titanic undertaking, and while continuing to work on it, Rodin executed for the town of Damvillers a statue of "Bastien-Lepage"; for Nancy a "Monument to Claude le Lorrain," representing the Chariot of the Sun drawn by horses; and for Calais "The Burgesses of Calais" surrendering the keys of the town and imploring mercy (see Plate). In this, Rodin, throwing over all school tradition, represents the citizens not as grouped on a square or circular plinth, but walking in file. This work was exhibited at the Petit Gallery in 1889. At the time of the secession of the National Society of Fine Arts, or New Salon, in 1890, Rodin withdrew from the old Society of French Artists, and exhibited in the new Salon the bust of his friend "Puvis de Chavannes" (1892), "Contemplation" and a "Caryatid," both in marble, and the "Monument to Victor Hugo" (1897), intended for the gardens of the Luxembourg. In this the poet is represented nude, as a powerful old man extending his right arm with a sovereign gesture, the Muses standing behind him. In 1898 Rodin exhibited two very dissimilar works, "The Kiss," exhibited again in 1900, a marble group representing Paolo Malatesta and Francesca di Rimini, and the sketch in plaster for a "Statue of Balzac." This statue, a commission from the Society of Men of Letters, had long been expected, and was received with vehement dissensions. Some critics regarded this work, in which the poet was represented in his voluminous dressing gown, as the first-fruits of a new phase of sculpture; others, on the contrary, declared that it was incomprehensible, if not ridiculous. This was the view taken by the society who had ordered it, and who "refused to recognize Rodin's rough sketch as a statue of Balzac," and withdrew the commission, giving it to the sculptor Falguière. Falguière exhibited his model in 1899. In the same Salon Rodin, to prove that the conduct of the society had made no change in his friendship with Falguière, exhibited a bust in bronze of his rival, as well as one of "Henri Rochefort." In 1900 the city of Paris, to do honour to Rodin, erected at its own expense a building close to one of the entrances to the Great Exhibition, in which almost all of the works of the artist were to be seen, more especially the great "Portal of Hell," still quite incomplete, the "Balzac," and a host of other works, many of them unfinished or mere rough sketches. Here, too, were to be seen some of Rodin's designs, studies, and water-colour drawings. He has also executed a great many etchings and *sgraffiti* on porcelain for the manufactory at Sèvres. His best known etching is the portrait of Victor Hugo. Rodin's works may be found in some private collections, and at the Luxembourg he is represented by a "Danaïd" (in marble), a "Saint John" (in bronze, 1800), "She who made the Helmet" (bronze statuette), and the busts of "J. P. Laurens" and of "A Lady." In the Musée Galliera is a very fine bust of Victor Hugo. Rodin has exerted a marked influence on many contemporary artists.

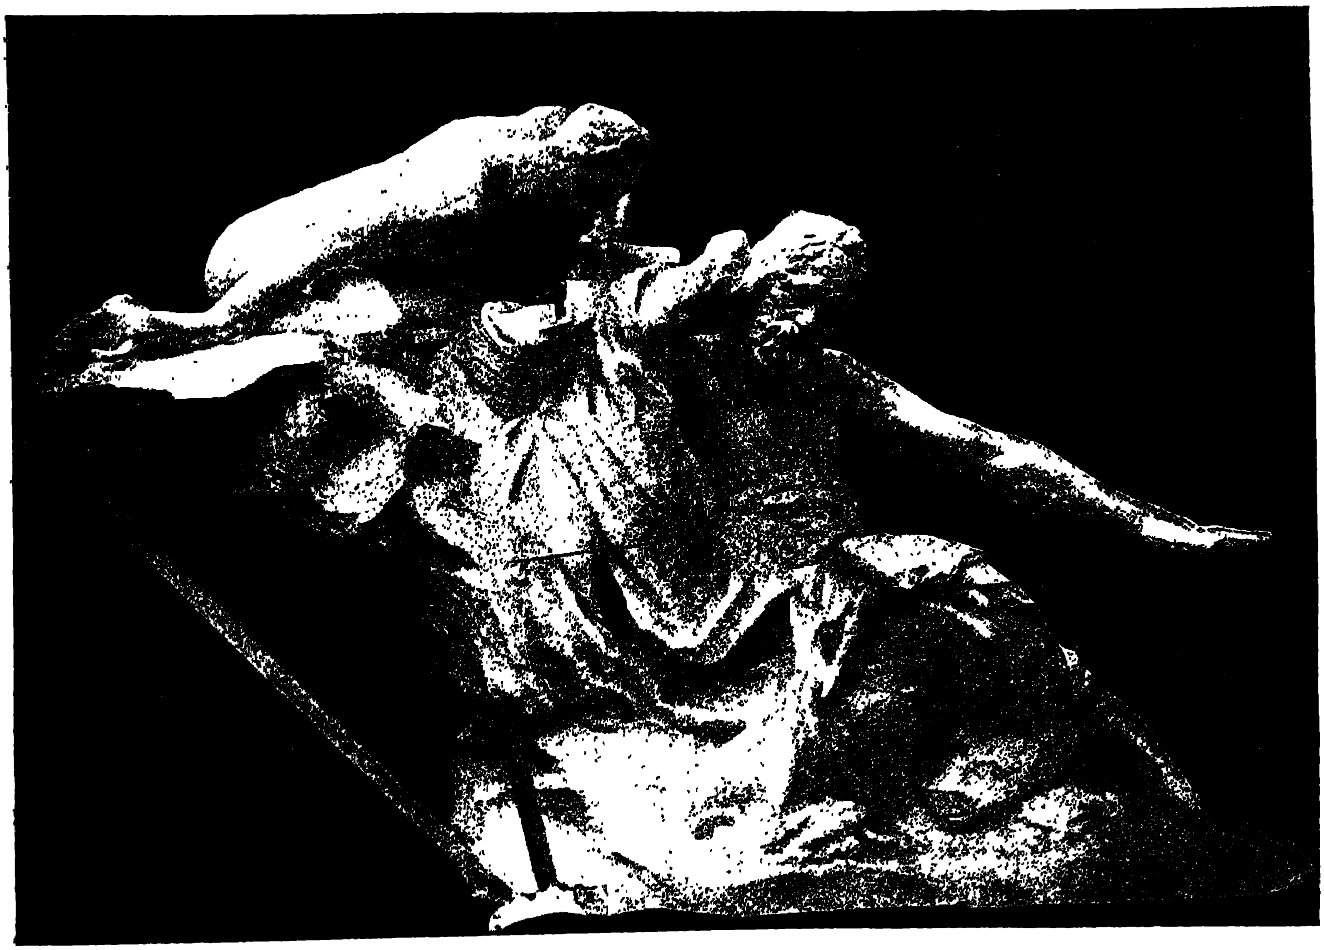
Rodosto, a town of European Turkey, is an open roadstead on the Sea of Marmora, about 85 miles west of Constantinople, of which it is practically a commercial dependency. It is the administrative centre of a district producing and exporting barley, oats, spelt, and canary seed, and largely planted with mulberry trees, on which

"The Burgesses of Calais." By Auguste Rodin.



Victor Hugo. By Auguste Rodin.

are fed silkworms of the "Baghdad" breed. White cocoons to the amount of 394 cwt. were exported to western Europe in 1901, besides a large quantity of silkworms' eggs to Russia and Persia. Being financially dependent on the capital, Rodosto suffered heavily during the commercial crisis which paralysed the trade of Constantinople in the years 1896–99, and a considerable area of land fell out of cultivation. This period of depression was followed, however, by two years of exceptional abundance. Population (1890), 19,558; (1902), 35,000.

Roebuck, John Arthur (1802–1879), British politician, was born at Madras on 28th December 1802. After the death of his father, a civil servant, his mother's second marriage transferred him to Canada, where he was chiefly brought up. He came to England in 1824, was called to the Bar, became intimate with the leading Radical and utilitarian reformers, was elected M.P. for Bath in 1832, and took up that general attitude of hostility to the Government of the day, be it what it might, which he retained throughout his life. At all times conspicuous for his eloquence, honesty, and recalcitrancy, he twice came with especial prominence before the public—in 1838, when, although at the time without a seat in Parliament, he appeared at the bar of the Commons to protest in the name of the Canadian Assembly against the suspension of the Canadian constitution; and in 1855, when, having overthrown Lord Aberdeen's ministry by carrying a resolution for the appointment of a committee of inquiry into the mismanagement in the Crimean War, he presided over its proceedings. In his latter years his political opinions became greatly modified, but with one interruption he retained his seat for Sheffield, which he had gained in 1849, until 1879, when he died with the reputation of an intrepid, pugnacious, perfectly disinterested and thoroughly impracticable senator.

Rogers, James Edwin Thorold (1823–1890), political economist, was born at West Meon, Hampshire, in 1823. He was educated at King's College, London, and Magdalen Hall, Oxford. After taking a first-class degree in 1846, he was ordained, and was for a few years a curate in Oxford. Subsequently, however, he resigned his orders. For some time the classics were the chief field of his activity. He devoted himself a good deal to classical and philosophical tuition in Oxford with success, and his publications included an edition of Aristotle's *Ethics* (in 1865). Simultaneously with these occupations he had been diligently studying economics, with the result that in 1859 he was appointed professor of statistics and economic science at King's College, London, a post which he filled till his death. From 1862 to 1867 he also held the position of Drummond professor of political economy at Oxford. During that period he published (in 1866) the first two volumes of his *History of Agriculture and Prices in England*, a minute and masterly record of the subject and the work upon which his reputation mainly rests. Two more volumes were published in 1882, a fifth and sixth in 1887, and he left behind him at his death copious materials for a seventh and eighth. In 1868 he published a *Manual of Political Economy*, and in 1869 an edition of Adam Smith's *Wealth of Nations*. In 1875 he collected and edited the *Protests of the Lords*. An intimate acquaintance with Cobden and John Bright led Rogers to take an active part in politics: he represented Southwark in Parliament from 1880 to 1885, and Bermondsey from 1885 to 1886, as a Liberal. In 1888, on the death of Professor Bonamy Price, who had succeeded him at Oxford as professor of political economy, he was re-elected to the post, and held it till his death. Previously (in 1883) he had been appointed lecturer in political economy at Worcester College, Oxford. His latter years were mainly spent at Oxford, where he died on 12th October 1890. He was celebrated in society as a wit and humorist. Of his miscellaneous economic and historical writings, which were numerous, the most noteworthy is his *Six Centuries of Work and Wages*, published in 1884.

(R. F. S.)

Rogier, Charles Latour (1800–1885), Belgian statesman, descended from a Belgian family that had settled in the department of the Nord in France, was born at St Quentin on 17th August 1800. His father, an officer in the French army, perished in the Russian campaign of 1812; and the family moved to Liége, where the eldest son, Firmin, held a professorship. Charles, after being called to the Bar, founded, in collaboration with his lifelong friends, Devaux and Lebeau, the journal *Mathieu Laensberg* (afterwards *Le Politique*), which by its ardent patriotism and its attacks on the Dutch administration soon acquired a widespread influence. When the insurrection of 1830 broke out at Brussels, Rogier put himself at the head of 300 Liégeois, and inscribing on his banner the motto, "Vaincre ou mourir pour Bruxelles," marched upon the capital. Here he took his place at once among the leaders of the revolutionary party. His influence saved the town-hall from pillage on 19th September. On the 24th a *commission administrative* was formed, of which Rogier became president. The energetic measures of this body and of its successor, the *gouvernement provisoire*, soon freed the greater part of the country from the Dutch troops. Rogier was sent as delegate of the provisional Government to Antwerp, where the citadel still held out for Holland. He succeeded in arranging an armistice, and then, in the exercise of the absolute power with which he was invested, organized afresh the entire administration of the city. He sat for Liége in the National Congress, voted for the establishment of a hereditary monarchy, and induced the Congress to adopt the principle of an elective second chamber. In the long-drawn debates on the bestowal of the crown, he ranged himself on the side of Louis Philippe: he first supported the candidature of Otto of Bavaria, and on the latter's rejection declared for the Duc de Nemours. Finally, when Louis Philippe declined the crown on behalf of his son, Rogier voted with the majority for Leopold of Saxe-Coburg. In June 1831 he was appointed governor of the province of Antwerp, a post rendered exceptionally difficult by the continued presence of Dutch troops in the citadel. The ability he displayed was so marked that in October 1832 he was made minister of the interior in the Goblet-Devaux cabinet. In the following June he intervened with characteristic courage in a quarrel in the Chamber of Deputies between Devaux and the Opposition leader Gendebien, claimed a prior right to give satisfaction, and fought a duel, in which he was severely wounded. During his term of office he carried, in the teeth of violent opposition, a law that established in Belgium the first railways on the continent of Europe, and thus laid the foundation of her industrial development. Owing to dissensions in the cabinet, he retired in 1834, together with Lebeau, and resumed the governorship of Antwerp. On Lebeau's return to power in 1840, Rogier became minister of public works and education. The proposals that he made in the latter capacity were defeated by the determined opposition of the Clerical party, and on the resignation of the ministry in 1841, Rogier gave his support to a compromise on the subject of education, which passed into law in 1842. He led the Liberal party in Opposition till 1847, when he formed a cabinet in which he held the ministry of the interior. He at once

embarked on a programme of political and economical reform. He took effective steps to remedy the industrial distress caused by the decay of the Flemish linen trade. The limits of the franchise were extended; and as the result of the Liberal policy of the Government, Belgium alone escaped the revolutionary wave that spread over the Continent in 1848. He passed a law in 1850 organizing secondary education under the control of the State, and giving the clergy only the right of religious instruction. The Clerical party, though unable to defeat this measure, succeeded in shaking the position of the cabinet; and it was finally undermined, after the *coup d'état* of 1851, by the hostility of the French Government, which found its political exiles welcomed by the Liberal cabinet at Brussels. Rogier retired in October 1852, but was brought back into office by the Liberal reaction of 1857. He again became president of the council and minister of the interior in a cabinet of which Frère-Orban was the most conspicuous member. The first important measure passed by the ministry was one for the fortification of Antwerp. In 1860 the fear of French designs on the independence of Belgium led to a movement of reconciliation with Holland, and inspired Rogier to write the only one of his numerous poems that is likely to survive, his national anthem, "La Nouvelle Brabançonne." Some of the ministers resigning in 1861, on the question of recognizing the kingdom of Italy, the cabinet was reconstructed, and Rogier exchanged the ministry of the interior for that of foreign affairs. In this capacity he achieved a remarkable triumph of diplomacy in freeing the navigation of the Scheldt, and thus enabling Antwerp to become the second port on the mainland of Europe. Defeated at Dinant, he sat for Tournai from 1863 till his death. His younger and more energetic colleague, Frère-Orban, gradually overshadowed his chief, and in 1868 Rogier finally retired from power. He continued, however, to take part in public life, and was elected president of the extraordinary session of 1878. From this time his age, his devoted patriotism, and the unassuming simplicity of his life made him the idol of all classes. The fiftieth anniversary of the kingdom of Belgium in 1880, and two years later that of his entry into parliament, were the occasion of remarkable demonstrations in his honour. He died at Brussels on 27th May 1885, and his remains were accorded a public funeral. (H. SY.).

Rohilkhand, or ROHILCUND, a division of British India, in the North-Western Provinces. It comprises the six districts of Bijnor, Moradabad, Budaun, Bareilly, Shahjahanpur, and Pilibhit. Area, 19,908 square miles; population (1891), 5,343,674, being 489 persons per square mile. It also includes the native state of Rampur. In 1897–98 the Rohilkhand system of canals irrigated 122,767 acres; the gross receipts were Rs.1,89,414, giving a net return of 3·67 per cent. on a capital outlay of Rs.17,73,000.

See Sir JOHN STRACHEY, *Hastings and the Rohilla War.* Oxford, 1892.

Rohlfs, Friedrich Gerhard (1831–1896), traveller, was the son of a physician, and was born at Vegesack, near Bremen, 14th April 1831. After the ordinary course at the gymnasium of Osnabrück, he entered the Bremen corps in 1848, and took part as a volunteer in the Schleswig-Holstein campaign, being made an officer after the battle of Idstedt, July 1850. He then for several years devoted himself to the study of medicine at the universities of Heidelberg, Würzburg, and Göttingen; but yielding to his natural inclination, he travelled over nearly all Europe, and then proceeded to Algeria, where he acted as military surgeon during the French campaign of 1855–60, and was appointed for his bravery Chevalier of the Legion of Honour. Having studied the language and customs of Algeria, Rohlfs went to Morocco in 1861, and presenting himself as a Mussulman, gained the favour of the enlightened Sherif of Wezzan, and was thus enabled to travel over the length and breadth of the country. He then explored the western portion of the Sahara and the entire extent of the Wed Draa, being the second European (the first being René Caillié) to visit Tafilet. Between that town and Kanatsa he was robbed by his guides and left for dead, 1862; but two marabuts charitably succoured him, and quickly recovering health, he again set forward in 1864 to Tuat, which he was the first European to reach and describe. Returning by Ghadames and Tripoli, he spent a few months in Germany, and then went back to Tripoli, intending to explore the highlands of the Ahaggar; but being prevented by a war among the Tuaregs, he went to Muzzuk, where he remained until 1866, and then entered Bornu, when he explored and mapped the oasis of Kawar. Rohlfs then passed through Mandara and its ancient capital Mora, and struck out for the coast of the Gulf of Guinea. Passing through Gugeba and Gongola, he crossed the Sokoto mountains, descended the Benue to Lakodja, and ascending the Niger to Rabba, proceeded on horseback to Lagos, and landed at Liverpool, 2nd July 1867. In the following year he accompanied the Abyssinian expedition, and traversed the Cyrenaica, reaching Egypt by way of the oasis of Siwa, 1869. Rohlfs then returned home, married, and settled down in Weimar. He did not rest long, however, for in 1873–74 he carried out an expedition to the desert of Libya for the Khedive. Commissioned by the German African Society, he proceeded to Wadai in 1878, but was driven back by the natives. In 1880 he accompanied Dr Stecker in the German exploring expedition to Abyssinia; but after delivering a letter from the Emperor to the Negus, he returned to Europe. In 1885 Prince Bismarck appointed him consul at Zanzibar; but he was shortly recalled, and did not again visit Africa. Rohlfs published accounts of each of his expeditions, as well as several works on Africa and its people. His death took place at Rüngsdorf, near Bonn, 2nd June 1896. (G. F. R.)

Rohtak, a town and district of British India, in the Delhi division of the Punjab. The town is a railway station, 42 miles north-west of Delhi. Population (1881), 15,699; (1891), 16,702; municipal income (1897–98), Rs.23,758. Cotton turbans are manufactured. The municipal high school cost Rs.22,000.

The district of ROHTAK has an area of 1797 square miles. Population (1891), 590,475; (1901), 630,711, showing an increase of 7 per cent. Land revenue and rates (1897–98), Rs.11,25,828, the incidence of assessment being R.0.13.5 per acre; cultivated area, 548,493 acres, of which 182,968 were irrigated, including 117,531 from Government canals; number of police, 433; number of schools (1896–97), 103, attended by 5087 boys, being 10·3 per cent. of the boys of school-going age; death-rate (1897), 32·64 per 1000. The principal crops are millet, pulse, wheat, barley, cotton, sugar-cane, and indigo. The district is traversed by the line of the Southern Punjab Railway from Delhi to Jhind, and also touched on by the Rewari Firozpur branch of the Rajputana Railway; total length, 52 miles. Part of it is watered by the Western Jumna canal. It is peculiarly exposed to drought, suffering in the famine of 1896–97 (when the maximum number of persons on relief was 12,781 in June 1897), and again in 1899–1900.

Roman, a town in Rumania, situated on the left bank of the river Moldava, near its junction with the

Sereth, is the chief place of the district of the same name. It is the seat of an Orthodox bishopric created in 401 by Alexander the Good. There are several fine churches, including the cathedral. Population (1895), 15,687; (1900), 14,019, of whom 6099 were Jews.

Roman Catholic Church.—The history of the Catholic Church since 1880 roughly coincides with the history of the Pontificate of Leo XIII., who came to the throne in 1878. It may be considered, therefore, in the present outline from that standpoint.[1]

As regards his own position at Rome, Leo XIII., like his predecessor, has kept up the protest against the invasion of his temporal sovereignty. The principal occasions on which he has spoken to this effect were his first Encyclical, which announced his accession and indicated the policy of his reign; the Allocution to the Cardinals of 4th August 1881, on the occasion of the insults offered to the remains of Pius IX. during their transfer from St Peter's to San Lorenzos without the Walls; and his Allocution of 2nd March 1884, on the occasion of the practical confiscation, under the guise of conversion, of the property of the Congregation de Propaganda Fide, the great central missionary agency of the Catholic Church. A recent clear account of the grounds on which the Pontifical protest is based may be read in Archbishop Ireland's Pastoral Letter (given by the *Tablet* for 11th January 1901), which cites the interesting analogy of the District of Columbia kept free from incorporation in the states of the Union in order to guard the independence of the Federal Government. So far from being animated by any temporal ambitions, as has been alleged, the Pontiffs declare that they must ever claim the restitution of the small temporal sovereignty which Providence has assigned them, precisely because without it it is impossible for them to discharge adequately their spiritual office as rulers of the universal Church. It is a continual charge made by their enemies against the Popes, that their action on the local Church administration in the different countries is the action of a "foreign Power." There would be some justification of the charge, or at least of the suspiciousness out of which it springs, if the Popes consented to be the subjects of any one temporal ruler; and it is only by their persistent protests against the subjection in which it is sought to place them that they have hitherto been able to avoid the difficulty. Again, the Popes require to surround themselves with various institutions through which, as central agencies, they may control and guide the work of the Church in its different departments throughout the world. Such are the Sacred Congregations, particularly the Holy Office, the Congregation of Bishops and Regulars, the Propaganda, the Mother-Houses of the Religious Orders. Unless the Pope can maintain these institutions in due freedom and with the necessary resources to enable them to do their work in the spirit, in the manner, and with the effectiveness which he judges desirable, the ill effects must be felt not in Rome only, but in every country. Once more, the region which is the headquarters of the Pontifical government should, above all others, be one in which the Church is free to display fully and publicly the characteristic features of Catholic life. It is certainly not one in which it ought to be exposed to anti-Christian restrictions and persecutions. Yet in regard to all these matters the Pope, if not a temporal ruler himself, must be at the mercy of the ruler under whom he is placed; a ruler whose government may be favourable to the Church's best interests, but may equally well be actively hostile to them. It is obviously with the view of showing that these liabilities are not merely theoretical that Leo XIII. has timed his recurrent protests as he has done.

Roman question.

If in Rome the necessity of securing for the Holy See its perfect liberty of action and immunity from suspicion in the exercise of a spiritual office affecting the whole world renders it impossible for the Popes to acquiesce in the invasion of their temporal jurisdiction, in other countries the same insistence on a particular form of government or objection to political change is by no means essential to Catholicism. Men who are Catholics by creed will have also their political opinions like other men, with whom they will divide off into parties, differing among themselves; and again, like other men, may take action in accordance with their political opinions. But as Catholics they have no complaint against any government solidly established in their midst on account of its form, as monarchical or republican, but only if it attempts to penalize the practice of their ancient religion, or their endeavour to bring up their children in the same. When this is done, they find themselves in the necessity of choosing whether they will obey God or comply with the laws imposed on their country, and it is obvious on which side lies their conscientious duty. On the other hand, where no attempt is made thus to interfere with their worship of God, there is no class of citizens on whose peaceful submission to their civil rulers greater reliance can be placed. The truth here stated is important, as explaining the contrasts between the Catholics and their respective governments in the three principal European countries.

In Great Britain, speaking generally, there is no longer a Catholic question, and the Catholics in consequence live in perfect contentment with the national institutions, and cause no anxiety to their rulers. In Ireland, indeed, there is dissatisfaction and agitation, but this is due partly to some serious religious grievances, but mainly to causes which are political and social, not religious.

In Germany, when the Pontificate of Leo XIII. began, a disastrous conflict between the Imperial Government and the Church was in progress. It was called the Kulturkampf, as professing to be undertaken on behalf of civilization and culture; but it had originated in the belief, instilled into the Government by interested persons, that the Vatican Decrees on Infallibility were issued for a political purpose. The May Laws—so called because passed through the Reichstag in May 1873—besides suppressing the religious orders, gave the entire control over the education, appointments, and tenure of office of the clergy into the hands of the State: they forbade also all disciplinary control over the clergy by any foreign ecclesiastical authority—in other words, by the Holy See. Compliance with such laws as these would have meant co-operation in a speedy conversion of German Catholicism into a schism and a heresy. The Catholics had therefore no other course left open to them save to continue as best they could their own system under the rule of the Holy See, and offer to the May Laws a resolute and as far as possible an organized passive resistance. This they did with the aid of the Centre or Catholic party in the Reichstag, but the consequences to themselves were terrible. Before many years were over five bishops, together with numbers of their clergy, were in prison, whilst several sees were vacant, and innumerable parishes left without other pastors than the few priests who went about in secret. At length it became evident even to the authors of the Kulturkampf that the effects of their campaign were the exact opposite of what they had desired: that they, by alienating a perfectly peaceful section of its subjects, were weakening instead of

Germany.

[1] See also the article VATICANISM for a treatment of some of these questions from a rather different point of view.—ED.

strengthening the bonds of the empire, and that this result was the more sad as they had been entirely misled as to the character of the Vatican Decrees, and were fighting against a purely imaginary danger. Thus by the time Leo XIII. came to the throne an opportunity had been created which, with his diplomatic instincts, he did not fail to perceive and use. In announcing his election to the German Emperor he took occasion to hope that the peace which had formerly prevailed throughout the empire between the Church and the Government might before long be restored; and in another letter to the Archbishop of Cologne he expressed his intention of working for that happy end to the extent of his power. The friendly overtures were received in a corresponding spirit; and although nothing was altered at the time, the *rapprochement* grew, and by 1886 had led to the withdrawal of the more obnoxious clauses of the May Laws, though some still remain. The consequences have been seen proportionately in the revived attachment of the Catholics for the empire and its rulers. It would, however, be an error to suppose that all traces of unfairness to this portion of the German people have been removed.

France. Whilst in Germany the relations between the Church and the State improved, in France they went from bad to worse, and all because the ruling party had not learnt the lesson taught it by the two neighbouring kingdoms. It was the Second Republic, and the Third Republic in its earlier stage, which conceded to the French Catholics their most valuable rights and liberties; and had the same tolerant spirit continued, probably the republican form of government would have been in general favour among them. But in 1879 the anti-religious party came into power, and the governmental principle which Gambetta had proclaimed shortly before was henceforth to prevail—"*le Cléricalisme voilà l'ennemi.*" The Ferry Ministry, which was under his domination, brought before the Chambers in 1879 two Bills framed with the express purpose of rendering impossible the Catholic education of the young. Of these the first and most important, besides suppressing the charters of the recently established and flourishing Catholic universities, declared all members of religious congregations unauthorized by the State incapable of giving public or even private education of any kind—a declaration aimed chiefly at the Jesuits, who had numerous schools throughout the country. The Senate refusing to pass the latter portion of the Bill, M. Jules Ferry resolved to accomplish his purpose in a more arbitrary way. In March 1880 he issued two ministerial decrees to the same effect as the rejected Bills. By the first the Jesuits were ordered to quit all their houses within the space of three months; and the other congregations of both sexes, under pain of incurring the same proscriptions, were ordered to apply within six month for an authorization, which it was intended in most cases to refuse. That these measures were illegal was made manifest by the fact that more than five hundred magistrates gave up office rather than enforce them; but they were none the less ruthlessly carried into effect, and the work of Catholic education was for the time in ruins. Gradually, however, thanks to the enormous energy of the French Catholics and the comparative tolerance of some of the cabinets which succeeded M. Ferry's, a tolerance due to the realization that the decrees had only proved sources of national division, the Catholic schools were re-established under lay proprietorship, but with staffs partly composed of members of the teaching congregations. Their numbers increased considerably, and they were preferred to the State schools by a growing number of parents, including those from whose political proclivities one would have least expected it. Hence the return of 1902 to the policy of M. Ferry, but with the aid of laws much more drastic than his decrees. Side by side with these endeavours to withdraw secondary education from the influence of the Church went on the process of "laicizing" the primary schools, orphanages, hospitals, and other State institutions—that is, of substituting staffs of lay officials for the brothers and nuns of the different congregations to whose care they had been previously entrusted. This process could only be gradual, in proportion as lay teachers and nurses were obtainable to fill up so many posts, but by the end of the 19th century the transformation was practically complete. Other measures tending in the same direction were the imposition of military service on candidates for the priesthood, and the serious diminution of the budget for the maintenance of the bishops and parochial clergy, which budget, by the terms of the Concordat, the State had pledged itself to provide annually, in exchange for the Church property then made over to it at its desire. These assaults of its adversaries on the Catholic Church in France were aided by the political divisions in the Catholic party, split up into Legitimists, Orleanists, Bonapartists, and Republicans, and thereby rendered incapable of any sustained action on a common principle. The evil seems to have been a matter of concern to Leo XIII. from the beginning of his Pontificate, and in February 1892 he wrote his famous *Encyclical to the French People*, exhorting them to lay aside political aims, over which they are so much at variance, and accept the form of government under which they were actually living, a form which in itself was not unlawful or incompatible with their religion on the one hand or with national progress on the other. He bade them unite to form a Catholic party on this basis, and use their constitutional rights to work for the restoration of their religious liberties and the pacification of their country. He addressed himself "not only to the Catholics, but to all upright and reasonable Frenchmen," appealing to them on the ground that only thus could domestic peace return to the nation under a durable social bond. The policy recommended in this Papal letter was not without its influence on the course of the religious movement in France. It was resented, indeed, in some circles, but was accepted and obeyed by the bishops and clergy generally, and gradually made its way among the Catholic body. The future alone can reveal to us whether it is destined to achieve a wider success; but at least it bears witness that the Holy See will always do its best to remove all needless causes of strife, and may help to dispel the delusion that the free development of Catholic life and work is a danger, and not rather a support, to any Government which will leave it unharassed. On the other hand, it is writ large on the page of modern French history that a policy of religious persecution tends only to cleave a nation in two, by parting off its sons into hostile camps, to the great detriment of the national welfare.

Encyclicals. A special feature of the history of the Pontificate of Leo XIII. is the series of Encyclicals by which that Pontiff endeavoured to guide Catholic thought on various subjects of importance. Among them the following have been the most notable: *The Æterni Patris* of 1879, in which an impulse was given to philosophical study, and the philosophy of St Thomas of Aquinas was indicated as the basis on which it should rest; the *Immortale Dei*, of 1st November 1885, on the Constitution of Christian States, in which the teaching of catholic philosophy on the origin, character, and limits of civil government was expounded; the *Libertas*, of 20th June 1888, which distinguishes between true and false liberty; the *Rerum Novarum*, of 15th May 1891, in which the right of personal property is vindicated, and the respective

rights and duties of employers and employed are set forth; the *Providentissimus Deus*, of 18th November 1894, which encourages Biblical studies, and declares what it is necessary for a Catholic to hold about inspiration. With these Encyclicals may be counted the *Letter*, of 18th August 1883, addressed to Cardinals Luca, Pitra, and Hergenroether, on the importance of a solid study of Church history. They were to prepare the Vatican Library for the use of scholars of all nations, without distinction of religious belief. Important use has been made of this permission, and the different Governments sent their representatives to search for documents bearing on the history of their respective countries. Of Leo XIII.'s letters of an administrative character three may be mentioned as having attracted much attention. The *Romanos Pontifices*, of 9th May 1881, settled within what limits the religious communities should henceforth be exempt from, or subject to, the jurisdiction of the bishops. It was originally issued to terminate certain controversies which had arisen in England, but has since been extended to other countries where the Church is similarly on a missionary footing. The *Officiorum et Munerum*, of 22nd February 1897, recast the Rules of the Index, with a view to adapting them better to the conditions of the modern period. The *Testen Benevolentiæ*, of 22nd January 1899, condemned a set of opinions which, having been advocated chiefly in America, had most unfortunately and inappropriately come to be called Americanism. Another class of Apostolic Letters was inspired by Leo XIII.'s ardent wish for the reunion of Christendom. In 1894, on 2nd July, appeared the *Præclara Gratulationis*, addressed to "the rulers and nations of the world." It was universal in its scope, but contained an urgent appeal to the Orientals, exhorting them to desire and work for the reconciliation of East and West. It was followed shortly afterwards by the establishment of a Roman Commission "for the reunion of Christendom," which was to sit regularly and work for that end. It was followed also in the same year by the *Orientalium dignitas*, or Apostolic Constitution for the Eastern Churches, which sought to remove the false impression that submission to the Holy See meant the abandonment of the ancient Eastern rites for those of the Latin Church. With this end in view it enforced the restrictions even previously enjoined, which compelled converts from the Eastern schismatic communions to attach themselves to corresponding Uniat Churches, and use their rites only. Shortly after the *Præclara Gratulationis*, namely, on 14th April 1895, appeared the Letter *ad Anglos*. It was likewise an appeal to work for reunion, and was intended to remove any impression which might exist that the Pope was animated by other than cordial and sympathetic feelings for English Protestants. This letter was succeeded on 29th June 1896 by the *Satis cognitum*, an exposition of the grounds on which the Holy See bases its duty of claiming supreme jurisdiction over the Church; and on 13th September 1896 by the Bull *Apostolicæ Curæ*. The latter was the outcome of a fresh inquiry into the validity of Anglican orders, which Leo XIII. had instituted to satisfy the desire of those who thought that previous inquiries had not been thorough enough to command confidence. This Bull declared the orders in question to be altogether null and void.[1]

Catholicism in England.

The Clergy.—On the accession of Queen Elizabeth a considerable portion of the clergy and people conformed to the new laws concerning Roman Catholicism, but the bishops, with the exceptions of Kitchin of Llandaff, Stanley of Sodor and Man, some 180 or more of the "dignified clergy," and an unknown number of the lower clergy, remained steadfast in the old faith and refused to take the oath of supremacy. Accordingly, the bishops were all at once dispossessed of their sees, and either imprisoned or placed under detention. The clergy likewise were gradually removed from their benefices. Thus the old machinery for ecclesiastical administration was destroyed, and the faithful found themselves without regular pastors. A portion, however, of the dispossessed priests contrived to live in concealment, and minister as best they could to the spiritual wants of those whom they could reach. Dodd says of them in his *History* (vol. ii. p. 141): "There was not a province through all England where several of Queen Mary's clergy did not reside, and were commonly called the old priests. They served as chaplains in private families. Their names and residences I have frequently met with in the manuscripts in composing this work. Again, several Catholic clergymen found such friends as to be permitted to enjoy sinecures, without being disturbed by oaths and injunctions." But these "old priests" must die out soon, and the old faith with them, unless new arrangements could be made for a continuous supply to take up and extend their work. The need was foreseen, and the "foreign seminaries" were established to provide for it. These were Douay College, founded by Dr (later Cardinal) Allen in 1568; the English College at Rome, remodelled for the purpose in 1576; St Alban's College, Valladolid, founded in 1589; and the establishments founded shortly after at Seville and Lisbon. Thither resorted young men of zeal and capacity to receive their ecclesiastical education, who were afterwards sent back as missionaries to their own countrymen. In distinction to the Marian clergy, they were called the "seminary priests," and were a special object of aversion to the Government, which had been counting on the inevitable extinction before long of the Marian clergy. Accordingly, it was made a capital offence for them to enter the country, and likewise for any person to harbour them under his roof for a night. Nevertheless they braved the danger, and came over regularly in yearly detachments, until by 1596 we learn, from a letter of Father Holt, there were about three hundred of them at work in the country. Many of them, however, paid the price of their zeal, suffering long and painful imprisonments not unaccompanied by the application of torture, whilst nearly two hundred shed their blood for their faith on the scaffold. The seminary priests were secular clergy, but they were supplemented in their work by members of two of the religious orders, the Jesuits and Benedictines. The Jesuits began to come in 1580, when Parsons and Campion were sent over, to be followed by regular supplies, which continued all through. At the beginning of the 16th century the Benedictines were also coming—that is to say, the Benedictines from abroad, who by this time were provided with some English subjects. The old English congregation of this order had died out with the Marian priests, except that there was just one former monk of Westminster, Father Sigebert Buckley, still surviving, who in 1607 admitted to profession twelve English-speaking Benedictines from abroad, and thus preserved the unbroken continuity of that congregation up to the present day. Some others of the religious orders appeared in small numbers, but took no part in the permanent missionary work of the country till much later. Still, some insight into the ultimate proportions between the different sections of the clergy may be had from the report to Propaganda of the Vicars-Apostolic towards the close of the period of the Penal Laws. According

[1] See also the article Anglican Orders.

to these reports, in 1773 there were then on the mission in England "121 Jesuits, 44 Benedictines, 37 Franciscans, 8 Dominicans, 7 regulars of other orders, and 175 secular priests." Besides the clergy actually working in the country, there were others belonging to the same categories retained on the Continent to carry on the schools there established for the education of youth, schools for them in England being forbidden under heavy penalties. Of these schools, one was at Douay in connexion with the seminary, and under the charge of the secular clergy; another, under the charge of the Jesuits, was at Saint Omer; and there were also establishments under the charge of the Benedictines at Douay, Paris, and Dieulwart. Mention should also be made of the English convents for Englishwomen wishing to lead the life of nuns, some of which also received young girls for their education. Such were the Bridgettines of Lisbon (the lineal representatives of the nuns of Sion House, Isleworth, who went into exile at the accession of Elizabeth); the Benedictines at Brussels, Cambrai, and Ghent; the Poor Clares at Gravelines; the Franciscans at Nieuport and Bruges; the Carmelites at Antwerp; the Sepulchrines at Liége; and the Augustians at Louvain. An effect of the French Revolution was to send all these houses of prayer and education back to England, where now they all have their representatives.

Ecclesiastical Administration.—The principle of authority pervades the Catholic system, and it would be accounted impossible for the clergy to engage in missionary work except in so far as they were commissioned and supervised by a competent ecclesiastical superior. When, therefore, the older system of administration broke down through the dispossession of the Marian bishops and those who held under them, it was necessary for the Holy See to substitute some other arrangement. The first measure of reconstruction was the granting of apostolic faculties (that is, faculties issued directly by the Apostolic See) to Drs Harding and Sander by Pius V. in 1566. These included the power to subdelegate; and a similar power was granted to de Quadra, the Spanish ambassador, who was a bishop. When Douay College was founded, Dr Allen was empowered by the Holy See to grant missionary faculties for the whole of England to the priests sent forth from the college. The next step in the development of the post-Reformation administration was the appointment in 1599 of an archpriest to reside in the country and exercise jurisdiction over the secular clergy, the regulars being still left under their own superiors for this purpose. As this arrangement curtailed the liberty of action which the seminary priests had till then enjoyed, it was not received without protest, and led to the "Archpriest controversy." George Blackwell, the first archpriest, was succeeded in that office by George Birkhead and William Harrison, the latter of whom died in May 1611. It was felt to be a great misfortune that the ruler of the missionary clergy should not be in episcopal orders; but the rigour of the persecution had hitherto made that appear impracticable, as a bishop would have been specially watched, and could not have hoped to avoid a speedy capture, as also to draw down a still fiercer persecution on the rest. On the death of Harrison, however, it was thought safe to make a further advance. The marriage of Prince Charles with the Catholic princess, Henrietta Maria, led to negotiations with the French Court, which insisted as a condition of the marriage that some relief from persecution should be extended to the English Catholics. Nothing definite was indeed settled, but advantage was taken by the Holy See of the passing disposition to mitigate the enforcement of the existing laws, and Dr William Bishop was appointed Vicar-Apostolic with episcopal orders. This prelate died almost immediately, but was succeeded by Dr William Smith, appointed, like his predecessor, titular Bishop of Chalcedon and Vicar-Apostolic over the whole of England. Bishop Smith's tenure of office was very brief. He became involved in what came to be called after him the "Bishop of Chalcedon controversy," over the question of the apostolic faculties of the regular clergy. As this drew attention to his presence in the country, he had to fly across the Channel, and took up his abode in Paris, where he remained till his death in 1665. He had also incurred the displeasure of the Pope by the position he had taken up in the aforesaid controversy, and was deprived of his office of Vicar-Apostolic. After him, and until 1685, the government of the clergy on the English mission was assumed by the Chapter, a body instituted by the first Vicar-Apostolic immediately after his own appointment. Their action in thus assuming to rule over the clergy was based on the common law of the Church, which entrusts the government of a diocese during the time of vacancy to the cathedral chapter; but as a Vicar-Apostolic has no right to a chapter, and the Holy See had never given the necessary formal approval to this English Chapter, the state of things ensuing was irregular, and amounted to a sort of anarchy. Three Papal envoys were sent over during the reign of Charles I.—Panzani, Con, and Rosetti—to reduce matters to order again. They were accredited to Queen Henrietta Maria, and probably would have succeeded in their task, only that the great Rebellion then broke out, during which nothing further could be done. After the Restoration, Monsignor Airoldi, the Papal Nuncio at Brussels, was sent over to resume the work, being accredited to Queen Catherine of Braganza; but nothing was accomplished till the reign of James II. James at once opened negotiations with Innocent XI., which led to the appointment of a new Vicar-Apostolic, Dr Leyburn, who was consecrated on 9th September 1685. He was appointed in the first instance, like his predecessors, Vicar-Apostolic over the whole country; but the area was too large for one man, and was divided in 1687 into two districts, and again in the following year into four, called respectively the London, the Midland, the Northern, and the Western districts. This arrangement was able to persist in spite of the renewal of persecution after the Revolution, and continued into the 19th century. In 1840 the growing needs of the Catholic body made necessary the subdivision of the four vicariates into eight, but even this was intended only as a temporary measure. Vicars-Apostolic are delegates of the Pope. Their indefinite powers are most suitable for regions where the Church is on a missionary footing, but they are not bound to their flocks by the same intimate ties as bishops in ordinary, and cannot become such effectual centres of pastoral work. Hence it is that there had been for some time a movement among the English Catholics for a restoration of the hierarchy, that is, of bishops in ordinary set over dioceses of their own, and formed into an ecclesiastical province under an archbishop. Probably the Holy See would have granted this sooner, only that it was most anxious to avoid offending English susceptibilities; and probably it would have delayed the measure still longer, could it have foreseen the fierce outburst of bigotry which it occasioned—contrary to the assurances received from English statesmen that the Government would view the matter with indifference. But it was well that it came when it did, for it was sadly wanted, and the English people soon discovered that it was a measure without political significance of any kind, but merely an arrangement for the better regulation and development of their spiritual life among the adherents of the ancient faith. The Bull *Universalis Ecclesiae*, restoring the hierarchy, was dated 29th September 1850. It

mapped out the country into twelve dioceses, a number which has since been increased by subdivision to fifteen. Care was taken in the selection of the sees to avoid all the names held at the time by the Anglican bishops, and in this desire the seat of the archbishop was placed at Westminster, not London. To give more impressiveness to the new order, a cardinal, Dr Wiseman, was appointed to be the first Archbishop of Westminster, and the precedent has been followed in the case of his two successors.

Statistics.—At the beginning of the reign of Elizabeth, even after her first penal laws had begun to tell, the adherents of the old faith were roughly estimated at about half the population of the country. By the end of her reign her repressive policy had achieved a practical success. There are no means of arriving at any figures, but it may be near the mark to conjecture that the Catholics then formed one-tenth of the whole. In the 17th century they continued to decrease, the persecutions following on the Gunpowder Plot and the Great Rebellion being specially disastrous to them. They increased again under James II., but the more skilfully contrived penal laws of William and Mary caused them to undergo another considerable fall. By the third quarter of the 18th century this fall had reached its ebb. A return to the House of Lords in 1780 gave the total number for England and Wales as 69,376, but this must have been a serious understatement. At all events, the turn of the tide began soon after, for Bishop William Gibson, who in 1819 computed the Lancashire Catholics alone at 50,000, stated that "within the last thirteen or fourteen years the mass of Catholics has been very great, in consequence of the abolition of the penal laws"; he means by the Acts of 1788 and 1791. During the 19th century, under the reign of tolerance introduced by the Emancipation Act of 1827, the number rose considerably, and is set down in the *Catholic Directory* for 1901 as about a million and a half. The contributory factors to this increase are (1) the natural growth of population, (2) the Irish immigration, and (3) the converts. The Irish immigration dates back in some measure to the end of the 18th century, but assumed large dimensions after the great famine of 1845. It was soon, however, superseded by emigration to the United States and the colonies, an emigration which drew off many of those who had previously immigrated into England. It is these Irish immigrants and their descendants who form the mass of the Catholic poor, particularly in the large towns, although this class has its numerous representatives of English birth in north Lancashire, as well as sprinklings in other parts of the country. In the upper and middle classes, in which, however, the absolute numbers are small, the English element probably predominates over the Irish, a fact largely due to the influx of converts during the last fifty years. As each reception of a convert is entered in the register of the church where it takes place, the means exist of computing their number with exactness. The average thus established during the later years of the 19th century was between eight and nine thousand a year. For the past it is more difficult to say, but in 1837, before the Oxford Movement began to influence the figures, we find Bishop Griffiths reporting to the Holy See that "last year 518 Protestants were converted to the Catholic faith in the London district," *i.e.*, in London and the home counties.

Against the growth of the Catholic population through the above-mentioned causes has to be set what is usually called the "leakage." This is a subject which has engaged much attention. Apart from neglected children who are picked up by Protestant institutions, there are apparently few Catholics who pass over to the religious practices of other denominations. But the number of those who neglect the practice of their own religion, and lapse into an indifferentism which either in themselves or their children tends to become permanent, must be very considerable, and perhaps balances, or even more than balances, the accessions to the Catholic population from other causes. This conclusion is established partly by actual observation, partly by inference from the number of baptisms and marriages. For the particulars on this point see Morris's *Catholic England in Modern Times* and Mr Britten's Catholic Truth Society's tract entitled *The Leakage.* The causes of the leakage are not difficult to recognize. The prevalent tone of thought and literature, so anti-dogmatic and agnostic, accounts for much. So too does the want of earnestness about their eternal destiny, which is to be expected in a proportion of the adherents of every religion, and naturally disposes them to abandon a religion whose tenets are disliked by the majority in the country where they live. But the most potent cause of all is the absence of proper parental control over the children of the poor in the period of life following on their school-days, an absence largely due to parental neglect, but largely also to the difficulty of exercising such control under the conditions of modern labour.

Catholic Institutions.—The growth of Catholic churches, chapels, and institutions since the establishment of the hierarchy has been very striking. In 1851 there were 826 priests and 586 churches in England and Wales; in 1880 there were 1962 priests and 1175 churches in the same area; in 1901 there were 2837 priests and 1536 churches. Some, too, of these churches are really fine buildings, as St George's Cathedral, Southwark; the Brompton Oratory; the Dominican Church at Haverstock Hill; the churches at Arundel, Norwich, and Cambridge. The Westminster Cathedral is recognized as destined to rank among the architectural monuments of London. Besides the growth in clergy and churches is the increase in colleges, monasteries, and convents. In 1851 there were only 12 monasteries and some 40 or 50 convents, most of which were in their infancy. Now there are some 80 monasteries, and convents innumerable, some 150 of which latter are engaged in the work of teaching. The number of colleges has also received accessions, whilst the few which are in the first rank have developed to considerable proportions. Some of these latter, as St Edmund's (Old Hall, Herts), Ushaw, and Stonyhurst, have already kept the centenaries of their abode on English soil, on the occasion of which some interesting books were written containing valuable information for the historical inquirer. It would have been impossible for a body so small and poor as the Catholics in England to provide for the educational needs of their children of the poorer class without aid from the public funds. Accordingly, since 1848, when the opportunity was first offered, the Catholic elementary schools have taken their place among the voluntary schools under Government. A great development has followed. In 1849 there were 89 schools, containing 8445 children, under Government inspection. By 1884 their numbers had grown to 828 schools and 169,115 children in average attendance, and by 1900 to 1049 schools and an average attendance of 251,768 children. The certificated teachers during the same interval grew from *nil* in 1848 to 2409 in 1886, and 2732 in 1900. To keep up the supply of these teachers there are three training colleges, one at Hammersmith for the male teachers, and two at Mount Pleasant, Liverpool, and West Hill, Wandsworth, for female teachers, to which another has been added at Glasgow for the female teachers in Scottish schools. A joint pastoral of the Catholic bishops in 1898 states that the Government grants earned by the

Catholic schools in 1897 amounted to £391,107, and the Government grants earned since 1848 to £6,013,513; also, that "between 1863 and 1895 the Catholic voluntary schools had subscribed (see Blue-books) £1,520,000; between 1870 and 1896, Catholics had spent on school premises (part of which is still owing) £1,850,000; whilst expenses on schools not under Government, or incurred before 1863, are estimated at over £1,000,000." And the bishops add that "if to the sum £4,370,000 (the sum total of the items just set down) be added the amount of school pence paid by parents of children in Catholic schools (£1,480,000), it will be found that the total contributed by Catholics towards public elementary education has been in reality much larger than the amount received in grants." It was not without a severe strain that the Catholic community supplied these sums; and besides them, there has been the expense of the training colleges, the condition of Government aid as regards which has been that the buildings and 25 per cent. of the cost of maintenance shall be provided by voluntary contributions. In connexion with Catholic elementary schools mention should be made of the Catholic School Committee, formed of priests and laymen representing the different dioceses. This was founded by the bishops in 1847, and has rendered invaluable service ever since. To it belongs the duty of maintaining and managing the training colleges, of making representations to the Education Office on questions that arise from time to time, of carrying out a system of religious inspection, and generally of unifying the action of all engaged in the work of the elementary schools. Besides elementary schools, it has been necessary to provide charitable institutions of various kinds—poor law schools, industrial schools, homes for destitute children, homes for penitents, homes for the sick and aged, nursing institutions, &c. A list of these may be found in the *Catholic Directory*, published annually, and a comparison of the current number with that for 1884 will show that during the interval good progress has been made. None the less, it is keenly felt by all Catholic workers how inadequate the existing supply is to meet the almost overwhelming demand. Further particulars as to these institutions may be learnt from the Catholic Truth Society's *Handbook of Catholic Charities*.

Foreign Missions.

The foreign missionary work of the Catholic Church has never been carried on with such a system of organization and on so large a scale as during the latter part of the 19th century. As regards organization, the whole of the foreign missions are placed under the supreme control of a central "Congregation," a kind of ministry or board, well known as "Propaganda" (Sacra Congregatio de Propaganda Fide), established by Gregory XV. in 1622. This important Congregation has been described as corresponding pretty much in the Catholic Church to the Colonial Office in the British Empire, and its head, the "Prefect of Propaganda," to the Secretary of State for the Colonies. It holds supreme control over all the foreign missions in heathen countries, and also over large and important parts of the Church in Christian countries whose Governments are not Catholic—including the British Empire, the United States, Holland, the Norse kingdoms, Greece, and some parts of Germany and Switzerland. A special section (erected by Pius IX.) has charge of the affairs of all the Oriental Rites in union with the Roman See. Confining our attention at present to the missions strictly understood under "foreign," *i.e.*, to heathen or non-Christian countries, we shall find the whole of these parts of the globe carefully mapped and parcelled out by Propaganda to a variety of missionary agencies or religious orders. The government of the various mission-fields is generally carried on by "Vicars-Apostolic" (*i.e.*, titular bishops acting as vicars or delegates of the Apostolic See) or "Prefects-Apostolic" (*i.e.*, priests with similar powers, but without episcopal rank). In some few cases (notably India and Japan) a regular territorial hierarchy has been established, just as in the United Kingdom and the Netherlands. Of the religious societies engaged in the evangelization of these many fields of labour, some have been established exclusively for foreign missionary work among the heathen—notably the famous Société des Missions Étrangères of Paris, the oldest and greatest of all (dating from 1658, and consisting of 34 bishops, 1099 European missionaries, and 598 native priests); the German "Society of the Divine Word," whose headquarters are at Steyl in Holland; the Belgian Society of Scheat; the celebrated French Society of the "White Fathers," founded by the late Cardinal Lavigerie for African missions; the English Society of St Joseph, founded at Mill Hill by Cardinal Vaughan; and some others. The other missions are entrusted to the care of various religious orders and congregations, which take up foreign missionary work in addition to their labours in Christian countries. Such are the Franciscans, Dominicans, Jesuits, Lazarists, Augustinians, Marists, &c. Besides the above orders of priests, an immense number of religious societies of women are engaged in works of education and charity throughout the whole of the foreign mission field. These have been reckoned at about 42,000 European and 10,000 native sisters. Again, there are some 20 congregations of "Brothers" (not priests) engaged in teaching, and numbering some 4500 members.

Turning now to the individual fields of labour under the care of Propaganda, we may briefly summarize the latest information as follows:—

FOREIGN MISSIONARY SOCIETIES AND THEIR FIELDS OF WORK.[1]

I. *Société des Missions Étrangères* (Paris, 1658).—*Missions:* Manchuria, Korea, Tibet, Japan, China (Sze-Chuen, Kui-Chow, Kwang-tong, Yunnan), Indo-China (W., S., and Upper Tongking, E., W., and N. Cochin-China; Cambodia; Siam), Malay Peninsula, Burma (S. and N.), S. India (dioceses of Pondicherry, Kombakonam, Mysore, Coimbatore). *Staff:* 34 bishops, 1099 European missionaries, 598 native priests. *Catholic flock:* 1,227,161.

II. *Society of "White Fathers"* (founded by Cardinal Lavigerie, 1868).—*Missions:* Algeria, Sahara, Nyasa, Victoria Nyanza, Tanganyika, Unyanyembe, Upper Congo. *Staff:* 9 bishops, about 150 missionaries.

III. *Lyons Seminary for Foreign Missions* (1856).—*Missions:* Nile Delta, Benin, Ivory Coast, Gold Coast, Dahomey, Upper Niger. *Staff:* 58 missionaries.

IV. *Congregation of the Holy Ghost* (1703 and 1848).—*Missions:* Senegambia, Gambia, Sierra Leone, Lower Niger, Gaboon, French Congo, Lower Congo, Mayotte, Nossibé, and Comoro Islands. *Staff:* 311 missionaries (9 bishops).

V. *Milan Seminary for Foreign Missions* (1850).—*Missions:* China (Hong Kong, N. and S. Ho-nan), East Burma, India (dioceses of Kishnagar and Haidarabad). *Staff:* 59 missionaries (7 bishops).

VI. *Steyl Society of Foreign Missions* (German, 1875).—*Missions:* S. Shan-tung, China; Togo, W. Africa. *Staff:* 1 bishop, 213 missionary priests, 555 lay brothers.

VII. *Scheut Society of Foreign Missions* (Belgian, 1863).—*Missions:* Mongolia, Kang-Su (China), Belgian Congo. *Staff:* 4 bishops, 61 missionaries.

VIII. *Picputian Society*[2] (Paris, 1817).—*Missions:* Hawaii, Tahiti, Marquesas Islands. *Staff:* 3 bishops, 50 missionaries.

IX. *Mill Hill Society* (English, 1866).—*Missions:* N. Borneo and Labuan; N. Punjab, Kashmir; and Ladak; Telugu missions of Madras; Maori missions of N. New Zealand; N. Uganda. *Staff:* 1 bishop, about 100 missionaries.

X. *Congregation of the Sacred Heart* (Issoudun, France, 1855).—*Missions:* New Guinea, New Pomerania, Gilbert Islands. *Staff:* 3 bishops, 34 missionary priests, 38 lay brothers.

XI. *Society of the Divine Saviour* (Rome, 1881).—*Mission:* Assam. *Staff:* 10 missionary priests, 3 lay brothers.

XII. *Verona Society for African Missions.*—*Mission:* The Sudan, Upper Egypt. *Staff:* 12 missionaries (1 bishop).

The following societies are engaged in home as well as foreign missions:—

XIII. *Marists* (French, 1816).—*Missions:* Fiji, Navigator's Island, New Caledonia, Central Oceania, Solomon Islands, parts of New Zealand (dioceses of Wellington and Christchurch). *Staff:* 6 bishops, 130 missionaries.

XIV. *Lazarists* (founded by St Vincent de Paul, 17th century).—*Missions:* Abyssinia, Persia, China (Peking or N. Chih-li, S.-W. Chih-li, Kiang-si, Che-Kiang), S. Madagascar. *Staff:* 226 missionaries (9 bishops).

XV. *Oblates of Mary Immaculate* (1840).—*Missions:* Ceylon (nearly all), S. Africa (Basutoland, Natal, Transvaal, Orange River Colony), the "Great North-West" of Canada (Athabasca-Mackenzie, Saskatchewan, St Boniface, New Westminster). *Staff:* 270 missionaries (9 bishops).

XVI. *Salesians* (founded by Don Bosco).—*Missions:* Patagonia and Tierra del Fuego, Falkland Islands, Indians of S. America (Ecuador, Brazil, Argentine); some missions in Palestine.

XVII. *Pallottines.*—*Missions:* Cameroon, W. Africa; Australia (Beagle Bay, native settlement).

XVIII. *Jesuits.*—*Missions:* India (dioceses of Bombay, Poona, Calcutta, Madura, Mangalore, Trichinopoly), Ceylon (dioceses of Galle and Trincomalee), China (Kiang-nan, S.-E. Chih-li), Madagascar, Koango (W. Africa), Zambezia, Jamaica, British Guiana, British Honduras, Alaska. *Staff:* 800 missionaries, of whom 460 are priests.

XIX. *Dominicans.*—*Missions:* Asiatic Turkey (Mosul), Tongking (N., E., and Central), China (Amoy, Fokien), Curaçao, Trinidad.

XX. *Franciscans.*—*Missions:* Egypt, Tripoli, Morocco, China (N. and S. Shan-si, N. and E. Shan-tung, N. Shen-si, E., N.-W., and S.-W. Hu-pe). *Capuchins:* Aden and Arabia, India (dioceses of Agra, Allahabad, Lahore), Seychelles, Eritrea (Red Sea), Gallas, Cephalonia, Trebizond, Mardin, Crete, Caroline Islands, Araucania, Brazil, Bulgaria. *Conventuals:* Jassy (Rumania).

XXI. *Benedictines.*—*Missions:* Ceylon (diocese of Kandy), New Zealand (diocese of Auckland), N. American Indians (Indian Territory and Oklahoma), Australian natives (New Nursia).

XXII. *Trappists.*—*Missions:* Settlements in Natal (Marianhill), West Africa (Congo), China, Japan.

XXIII. *Augustinians.*—*Missions:* Philippines,[3] China (N. Hu-nan), Balkan Peninsula, Asia Minor ("Assumptionists").

XXIV. *Carmelites.*—*Missions:* Bagdad, India (dioceses of Verapoly and Quilon).

XXV. *Redemptorists.*—*Missions:* Dutch Guiana.

XXVI. *Passionists.*—*Missions:* Bulgaria (diocese of Nicopolis).

SOCIETIES FOR THE SUPPORT OF FOREIGN MISSIONS.

Society of the Propagation of the Faith (est. in Lyons, 1822).

Receipts,	1822–31	£72,000
	1852–61	1,100,000
	1882–91	2,604,000

Total in 70 years, 1822–1892, £10,714,000 (of which sum France contributed £3,000,000).

Society of the Holy Childhood (est. 1843 as auxiliary to the former; "children for children").

Receipts, 1843–91, £3,336,000 (of which France contributed £1,500,000).

Work.—Supports 624 orphanages, 3022 schools, 332 workshops, 167 farms, 837 dispensaries; educates 146,000 children. Number of children subscribers (½d. a month), about five millions.

Society of the Schools of the East (est. 1855).

Smaller and special societies attached to each of the missionary congregations and societies.

AUTHORITIES.—I. **For General Reference.**—The latest and most comprehensive dictionary is the second edition of *Wetzer und Wette's Kirchenlexikon* (edit. Hergenröther and Kaulen, 1882, &c., Freiburg in B., Herder). Taken together with the *Staatslexikon* (same publishers), this work, when completed, will supersede the first edition (1847–1860), of which there is a French translation (edit., I. Goschler, 1870).—MIGNE's ample *Encyclopédie Théologique*, though partly antiquated, contains much useful matter. The same may be said of GAETANO MORERI, *Dizionario di Erudizione.* Venice, 1840–1861; Index, 1875, 107 vols.—ADDIS and ARNOLD (and SCANNELL). *A Catholic Dictionary.* London, Kegan Paul, 1884, 1893, 1897.

II. **On the Machinery of Modern Government at Rome, with allied Questions.**—G. GOYAN (and others). *Le Vatican.* Paris, Firmin Didot, 1895.—CH. DE T'SERCLAES. *Le Pape Léon XIII., sa vie, son action religieuse, politique, et sociale.* Paris, Desclée, 1894.—BERNARD O'REILLY. *Life of Leo XIII.* London, Low, 1887.

III. **Collections of Modern Papal Decrees.**—The best is the *Analecta Juris Pontificii*, 1855 to 1891, since 1893 called *Analecta Ecclesiastica.* Rome, Palazzo Cenci. The Constitutions, etc., of Pope Leo XIII., *S. D. N. Leonis, PP. xiii., Allocationes, etc.* Bruges, 1887–1894, 4 vols.—Shorter English handbooks on this subject: W. HUMPHREY. *Urbs et Orbis.* London, Baker, 1899.—W. H. EYRE. *The Pope and the People.* Leamington, Art and Book Co., 1895.—Many valuable documents concerning the questions discussed at the Vatican Council: *Acta et Decreta S. Conciliorum recentiorum, Collectio Lacensis*, vol. vii. Freiburg im B., Herder, 1890, in progress.

IV. **English Catholic Periodicals**, which report the decrees of Roman congregations, and discuss literary, educational, and legal questions: *The Dublin Review* (quarterly, Burns), *The Month*, (monthly, Longmans), *The Tablet* (London, weekly).

V. **Catholicism in England since the Reformation.**—JOSEPH GILLOW. *Bibliographical Dictionary of the English Catholics.* London, Burns, 1885–1895. In progress, goes to MET, 4 vols. On the general history of Catholicism in Great Britain, the amplest modern work is that of ALPHONS BELLESHEIM, *Cardinal Allen und die Englishen Seminare* (Mayence, Kirchheim, 1885), *Katholische Kirche in Schottland* (*ibid.* 1886), *Katholische Kirche in Irland* (*ibid.* 1890). His *Catholic Church in Scotland* has been translated and enlarged by D. O. Hunter Blair, O.S.B. Edinburgh, Blackwood, 1887.—CHARLES DODD (*vere* HUGH TOOTELL). *Church History of England* (1737, 3 vols., goes down to 1688). New edition 1839–1843, "with notes, additions, and continuation, by Rev. M. A. Tierney" (unfinished).—BUTLER, CHARLES. *Historical Memoirs respecting the English, Irish, and Scottish Catholics.* London, 1819, &c.—W. MAZIERE BRADY. *Episcopal Succession in England, Scotland, and Ireland.* Rome, Typ. della Pace, 1876, 3 vols. The last volume treats of the post-Reformation period exclusively.—T. F. KNOX. *The Douay Diaries.* London, Nutt, 1878. *Letters of Cardinal Allen. Ibid.* 1882.—J. MORRIS. *Catholic England in Modern Times.* London, Burns, 1892.—T.

[1] Many statistics only up to 1890.

[2] Father Damien belonged to this society, which takes its popular name from the Rue de Picpus, Paris.

[3] Not under Propaganda.

MURPHY. *Catholic Church in England during the Last Two Centuries. Ibid.* 1892.

VI. **Nineteenth Century.**—W. J. AMHERST. *The History of Catholic Emancipation,* 1771–1820. London, Kegan Paul, 1886, 2 vols.—F. C. HUSENBETH. *Life of John [Bishop] Milner.* Dublin, 1862.—W. WARD. *Life and Times of Cardinal Wiseman.* London, Longmans, 1897, 2 vols. *W. G. Ward and the Oxford Movement. Ibid.* 1892. *W. G. Ward and the Catholic Revival. Ibid.* 1895.—E. S. PURCELL. *Life of Cardinal Manning.* London, Macmillan, 1895, 2 vols.

VII. **Catholic Education.**—J. GERARD. *Stonyhurst College.* Belfast, Ward, 1894.—R. C. LAING. *Ushaw College.* Newcastle, Mawson, 1895.—B. WARD. *St Edmund's College, Old Hall.* London, K. Paul, 1893. A chronicle of the strenuous efforts of Catholics to provide elementary schools is a desideratum, but much valuable information may be found in the annual *Reports* of the *Catholic School Committee* (London, 42 Gerrard Street), founded in 1847.

VIII. **Catholic Sufferings under the Penal Laws.**—For general reference: R. STANTON. *A Menology of England and Wales.* With supplement, London, Burns, 1892. No part of Catholic history has been better explored than this. The principal modern writers are: T. E. BRIDGETT, A. GASQUET, A. JESSOPP, J. MORRIS, R. SIMPSON; but Bishop CHALLONER'S *Missionary Priests* (1741, &c.) still remains the classical work on this subject.

IX. **Present State of English Catholics.**—*The Catholic Directory.* Annual, London, Burns. *Handbook of Catholic Charities.* London, Catholic Truth Soc., 1894.—W. S. LILLY and J. E. P. WALLIS. *Manual of the Law especially affecting Catholics.* London, Clowes, 1893. The addresses and papers read in the annual *Conference of the Catholic Truth Society.* Reported in the Catholic newspapers. The C.T.S., 21 Westminster Bridge Road, publications also deal briefly with most modern subjects.

X. **Foreign Missions.**—*Missiones Catholicæ cura S. Congregationis de Propaganda Fide descriptæ.* Romæ, ex Typographia polyglotta S. C. de Prop. Fid. [official biennial publication].—LOUVET. *Les Missions Catholiques au xixe. Siècle.* Nouvelle Édition, 416 pp. Lyon, Bureau des Missions Catholiques, 14 Rue de la Charité, 1900.—PIOLET. *Les Missions Catholiques Françaises au xixe. Siècle,* 6 vols. Paris, A. Colin, 5 Rue des Mézières.—O. WERNER. *Atlas des Missions Catholiques.* Tribony en Brisgau, Herder, 1886. *Album des Missions Catholiques,* 4 vols. Paris, Société St Augustin, 1888.

Periodicals.—*Les Missions Catholiques* (weekly), publ. in Lyons, and corresponding monthly or weekly papers in Italian, German, Dutch, Spanish, Polish, Hungarian, and English. (The last-named is monthly, price 3d., published in London, 19 Henrietta Street, Strand, W.C.) *Annales de la Propagation de la Foi* (monthly), published in Lyons, with translations in nearly all countries.

(✠ H. E. V.)

UNITED STATES.

The history of Roman Catholicism in the New World begins with the Norse discoveries of Greenland and Vinland the Good. In the former the bishopric of Gardar was established in 1112, and extinguished only in 1492. To the latter (the coast of New England) the Northmen during the same period made "temporary visits for timber and peltries, or missionary voyages to evangelize for a season the natives." Beyond these facts, the Norse sagas and chronicles contribute little that is certain (cf. "The Norse Hierarchy in the United States," *American Cath. Quart. Review,* April 1890). Although a bishop was appointed by the Pope for the vaguely defined territory of Florida so early as 1528, the oldest Catholic community in what is now the United States dates from 1565, when the Spanish colony of St Augustine was founded. Hence the aboriginal tribes of the South were evangelized. In 1582 the missions of New Mexico were undertaken, and from 1601 Catholic missionaries were at work along the Pacific coast, especially in California. Early in the 17th century trading posts and mission centres were established on the coast of Maine, and during the same century French priests laboured zealously in northern New York, along the entire course of the Mississippi from Wisconsin to Louisiana, and around the Great Lakes. Their principal concern was for the savages, over whom they acquired an extraordinary influence. Political jealousies, human avarice, and treachery arrested the progress of most of their missions. The foundation of the English colony of Maryland (1634) by the Catholic George Calvert (Lord Baltimore), and of Pennsylvania (1681) by the tolerant Quaker William Penn, first permitted the legal existence of Catholicism in English-speaking communities of the New World. It is from these centres that it spread during the 18th century. In 1784 the Rev. John Carroll was appointed Prefect-Apostolic for the Catholics of the English colonies, hitherto dependent on the Vicar-Apostolic of London. In 1790 Father Carroll was made bishop of the see of Baltimore, and given charge of all Catholic interests in the United States. There were then about 30,000 Catholics in the land, of which number 16,000 were in Maryland and 7000 in Pennsylvania. In 1807 they had grown to 150,000, with 80 churches. In the following year Baltimore found itself the first metropolitan see of the United States, with New York, Philadelphia, Boston, and Bardstown as suffragans.

The growth of the Catholic population by decades since 1820 was calculated by a competent historian, the late John Gilmary Shea, as follows:—

1820	244,500	1860	3,000,000
1830	361,000	1870	4,685,000
1840	1,000,000	1880	7,067,000
1850	1,726,470	1890	10,627,000

According to this ratio of increase, the Catholic population of the United States ought to have been in 1900 something over 14,000,000. Hoffmanns' *Directory,* however, for that year puts it at 10,129,677. The reason of this discrepancy is found in the fact that absolutely trustworthy official figures of the Catholic population are not accessible. The main source of this growth has been immigration. Originally the Irish and the Germans furnished the greater quota. Later, the French Canadians, Italians, Poles, and Bohemians added notably to the Catholic population; an appreciable percentage of Oriental Catholics is also found—Greeks, Syrians, Armenians, &c. Natural increase, especially among the descendants of the first Catholic immigrants, and a certain percentage of conversions from Protestantism, are contributory sources. Being under the protection of the constitution, and enjoying the advantages of the common law, Catholicism could not meet with any official opposition; such few outbursts of fanaticism as there have been were but temporary or local, and did not represent the true feelings of the great Protestant majority of the country.

As to the future of the Church in the United States, all Catholics feel, with their latest historian, that "the Catholic Church is in accord with Christ's revelation, with American liberty, and is the strongest power for the preservation of the Republic from the new social dangers that threaten the United States as well as the whole civilized world. She has not grown, she cannot grow, so weak and old that she may not maintain what she has produced—Christian civilization."

Doctrine and discipline.

Internally, Catholicism in the United States has been free from any noteworthy schisms or heresies that might impede its development—its doctrinal history offers nothing of importance. The discipline differs little from that of the other Churches of Catholicism. The unity of doctrine, liturgy, and moral ideals is preserved by an intimate union with the see of Rome. The general canonical legislation of the Church, the legislation by papal rescript and the Congregation of the Propaganda, the decisions of the Apostolic Delegation at Washington, and a certain amount of immemorial custom and practice, form the code that governs its domestic relations. Decennially each bishop of the United States is expected to pay a visit to Rome (*Ad Limina Apostolorum*), and to make a report of the

spiritual condition of religion within his diocese. In addition, a system of synods provides for local unity among bishops, priests, and laity. Thus each diocese holds occasional synods, each province or body of bishops under a metropolitan holds provincial councils, while at greater intervals a plenary or national council is held. Of these last, three have taken place—their decrees, when approved at Rome, are binding on all Catholics in the United States.

In education the Catholic Church endeavours to keep abreast with the best. There were, according to Hoffmanns' (Milwaukee, 1900) *Directory*, 3811 parochial schools, in which 854,523 children of both sexes receive instruction. If to these be added the children in Catholic charitable institutions, the number reached is nearly one million. There were 170 colleges for boys and 662 academies for girls. This system of education is crowned by the Catholic University of America at Washington, established by Leo XIII. and the American hierarchy, and endowed with all the privileges of the old pontifical universities of Europe. In addition, there are several other schools that rank as universities. The education of the clergy is provided for by seminaries. In 30 of these that are under episcopal direction there are 2630 students; in 79 that belong to religious orders, 1998 students are reckoned. The charitable institutions of the Church in the United States are very numerous. There are 251 orphan asylums, with 35,243 inmates. The other charitable institutions are 827 in number, and include every form of public and private charity; no diocese is without one or more such establishments. The actual government of the Catholic Church in the United States is represented by 1 cardinal, 14 archbishops, 77 bishops, 8660 diocesan clergymen under the sole and immediate direction of their bishops, 2976 members of religious orders subject to episcopal supervision—in all, 11,636 clergymen. There are 6409 churches with resident priests, and 3930 mission churches—in all, 10,339, to which must be added 1723 chapels. Several hundred weekly publications are printed in English and in foreign tongues, to minister to the religious needs of the Catholic population. There exist also several literary and academical magazines and reviews of a high order of merit.

The principal religious events since 1880 were the holding of the Third Plenary Council of Baltimore (1884), the Catholic Congress (1889), the opening of the Catholic University (1889), the Columbian Educational Exhibit at Chicago (1893), the establishment of the Apostolic Delegation at Washington (1893).

The Catholic Church in the United States conducts no foreign missions, but takes care of its own percentage of Indians and negroes. Of the Indian population of the United States about 90,000 are Catholics. They are attended by 113 priests, who look after 183 churches or chapels. There are 73 schools conducted by the members of 24 sisterhoods, in which over 5000 Indian children are educated. The Catholic negroes are about 140,000 in number. They have 40 churches, conducted by 45 white clergymen; 81 schools, in which 6401 coloured children are educated by 24 sisterhoods, who also conduct 11 charitable institutions. The expenses of these missions are borne by private charity, and by a general annual collection, which in 1899 amounted to $59,247.

There exists no satisfactory history of American Catholicism. Among the more useful helps may be indicated the following:—**General History**: JOHN GILMARY SHEA. *Life and Times of Archbishop Carroll*, N.Y., 1888; *The Catholic Church in Colonial Days*, N.Y., 1886; *The Hierarchy of the Catholic Church in the United States*. N.Y., 1886.—BISHOP O'GORMAN. *A History of the Catholic Church in the United States*. 1895. This work contains a useful bibliography.—CLARKE. *Lives of the Deceased Bishops*, 1872. **Statistics**: *The Annual Directory of the Catholic Clergy*. Of these, two are published; one by D. and J. Sadlier, New York, the other (Hoffmanns') by M. Wiltzius and Co. of Milwaukee. The Catholic general statistics of the eleventh (1890) census may be found in *The Religious Forces of the United States*, by H. K. Carroll, N.Y., 1893. Those of the twelfth (1900) are printed in the official reports of that census. **Legislation**: *Acta et Decreta Concilii Plenarii Baltimorensis*, iii., Baltimore, 1886. This is illustrated and brought into relation with the general laws of the Church in Smith's *Elements of Ecclesiastical Law*, New York. In connexion with this may be read Humphrey's *Urbs et Orbis*, London, 1899, an account of the general government of Roman Catholicism.

(✠ J. G.)

Roman Walls (*Recent Excavations*).—The mainland of Great Britain twice contracts to a narrow width—once north and once south of the English and Scottish border. From Clyde to Forth is barely 35 miles; from Tyne to Solway, barely double the distance. The Romans at one time or other took each isthmus as their frontier; and since the distances were short, fortified each with a continuous wall. The southern line, Hadrian's Wall, was occupied far longer, and was far more important, than the northern "Wall of Pius."

For modern purposes, the dominant feature of the southern isthmus is the easy natural passage which the valleys of the Tyne and Irthing provide for road and railway between Newcastle and Carlisle. But the utilization of this passage is modern. It was not used by the Romans, and even in 1745 it was found to be roadless. The Roman frontier works followed the high ground to the north of the valleys. In the east they commenced at Wallsend-on-Tyne and traversed the moors of south-east Northumberland; inland they climbed along precipitous basalt cliffs; in the west they descended through the lowlands of Carlisle, south of Scaleby and Solway mosses, to the coast at Bowness. Military reasons—the shortness of distance and the advantages of cliff and moss—seem to have suggested this line. Politics and commerce had no share in determining it: the land south of the wall is for miles as desolate as the land north of it, and no native racial boundary can be traced in this neighbourhood.

The actual frontier works are threefold. First, there is a wall of stone, with a ditch in front, forts behind, and a connecting road. The wall was 8 feet thick and originally perhaps 16 feet high; the forts, walled in stone, varied in size, but the larger covered from 3 to 5 acres. Secondly, there is the so-called vallum—in reality no vallum at all, but a broad flat-bottomed ditch, out of which the earth has been cast upon either side, and heaped into regularly made mounds resembling ramparts. Thirdly, there is the turf wall, constructed of sods laid in regular courses, with a ditch in front. The stone wall and "vallum" have long been known, and are among the stateliest monuments of Roman military power that time has spared. The turf wall was first found in 1895, is nowhere clear on the surface, and is only traceable at all at special points.

Excavations along the Wall have had two objects—either to examine the forts, to plan their buildings, and collect inscriptions, &c.; or to ascertain the relations of stone wall, "vallum," and turf wall—that is, to recover the history of the Roman frontier. Earlier excavators, like Clayton and Bruce, essayed principally the first task; since 1893 both have been tried.

(*a*) *Forts*.—Before 1893 much of Chesters (*Cilurnum*) had been uncovered, and casual search made elsewhere. In 1894–97 bits of Greatchesters were dug; in 1898 Housesteads (*Borcovicium*) was entirely excavated by Mr R. C. Bosanquet and others. If we combine the results won on these sites with those won at High Rochester (partly excavated about 1850), at Hardknott (1892), at Gellygaer, near Cardiff (1900–01), and in Scotland, we

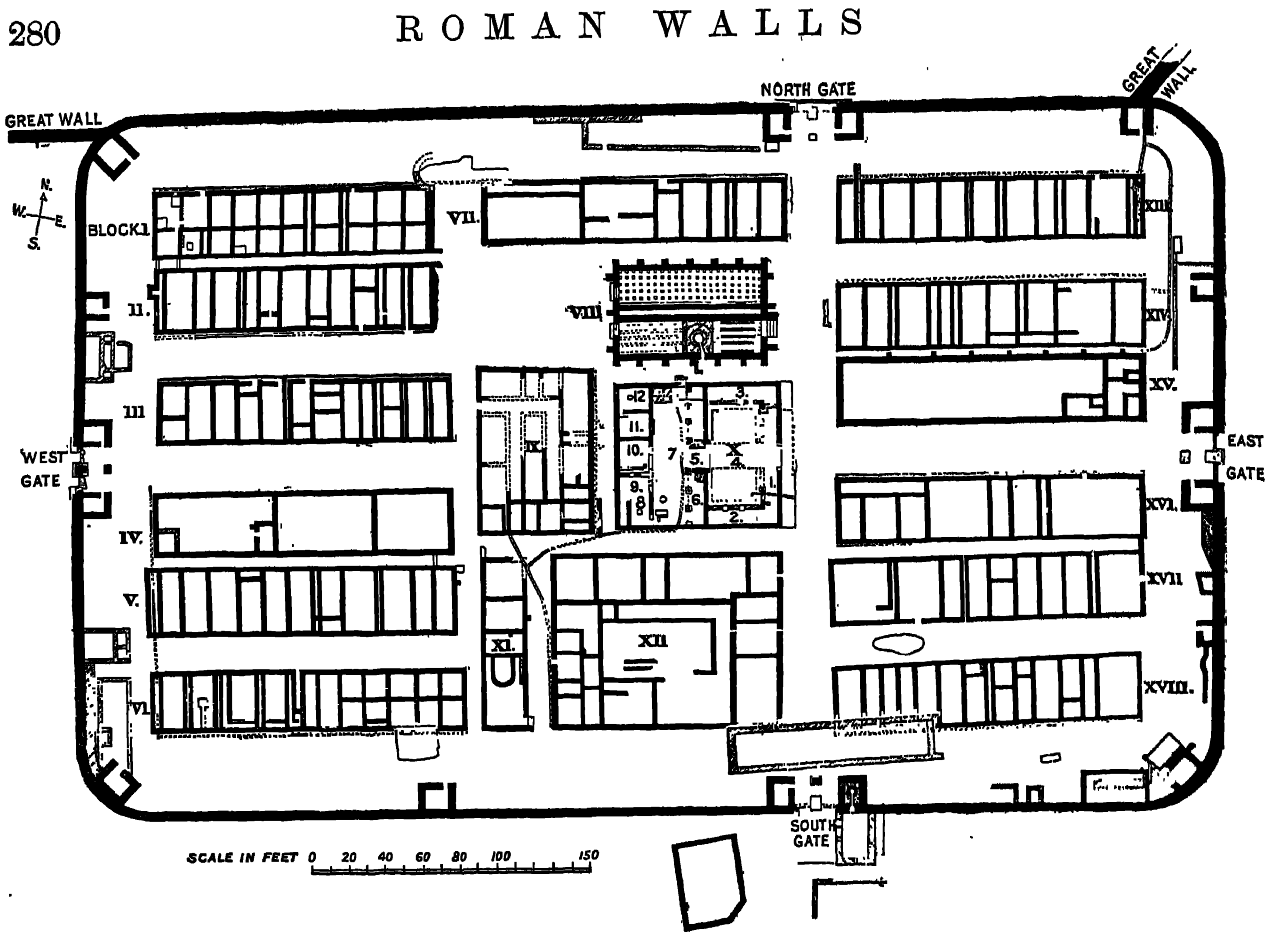

FIG. 1.—Plan of Housesteads (Borcovicium).

may seem to have acquired much evidence respecting Roman forts in Britain. We have, however, achieved less than the Germans on the Limes and the French in Algeria. What we do know may be illustrated from Housesteads. This fort measures about 120 by 200 yards, and covers 5 acres (see Plan, Fig. 1). Its walls are stone, its north wall the same as the great wall which runs from sea to sea. Within, it is full of buildings of stone. Chief among these is the "Prætorium," in the centre of the fort—a rectangular structure enclosing two small open courts and a row of small rooms (shrine for official worship, treasury, &c.), which faced on to the inner (western) court (Plan, x.). This was the official centre of the fort. Close by were officers' quarters (Plan, xi., xii.) and storehouses with buttresses and dry basements (Plan, viii.). The long blocks which filled the ends of the fort were doubtless principally barracks (Plan, i.–vi., xii.–xviii.). Outside the fort stood various buildings not all yet explored —a bath-house, a little way east; a shrine of Mithras, and perhaps other shrines, a little way south; and huts of camp-followers, women, &c. To the north-east, outside the great wall, is a tiny hollow, formerly explained as an amphitheatre, now thought to be only a quarry. Such is Housesteads, and such probably were nearly all the Roman forts in Britain. They differ somewhat from Roman forts in Germany, notably in the details of their "Prætoria" and in the number of their stone-built structures. Even in military matters, it seems, the Roman provinces varied from each other.

(*b*) *Wall, "Vallum," &c.*—Ancient writers assert that Hadrian (about A.D. 120) built in North Britain a wall for 80 Roman miles from sea to sea. The mileage and various inscriptions prove that this refers to some part of

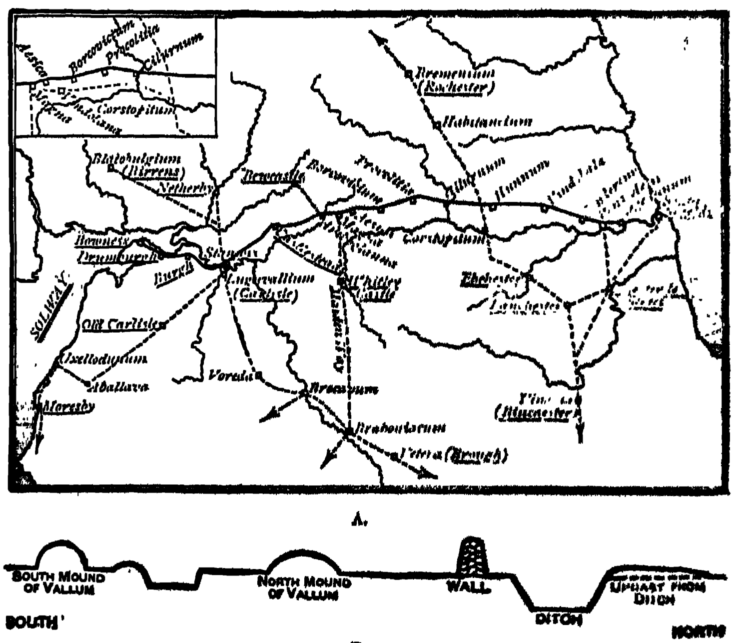

FIG. 2.—A, Hadrian's Wall; B, Section of the same. (From *Social England*, by permission of Cassell and Co. Ltd.)

the frontier works of the southern isthmus. Ancient writers also say that Severus (about A.D. 208) built a wall in North Britain from sea to sea. But they differ as to its length; inscriptions do not wholly support them, and their

statement has been variously explained. Hodgson and Bruce, the chief local authorities of the last century, maintained that Hadrian erected the stone wall, with its forts, against northern enemies, and the "vallum" against southern insurgents, while the work of Severus was confined to a few repairs in the stone wall. This was the accepted view till lately, but recent excavations show that in several points it is not tenable.

In the first place, the stone wall and its forts, which the visitor now admires, were not the earliest frontier works. An earlier line (as it seems, a wall of turf) has left clear traces of itself at Chesters and Birdoswald (*Amboglanna*), and we have not one wall but two walls to deal with. The dates of these are still doubtful. But our ancient writers mention two wall-builders, Hadrian and Severus; and the most natural conclusion is that Hadrian built the first wall in turf, and Severus reconstructed it and its forts in stone. It has been acutely suggested that probably Severus adhered as closely as possible to his predecessor's line, in order to use the existing ditch; in one or two cases, however, as at Birdoswald, he deviated. Evidence can be adduced from other parts of the Roman Empire to show that the Roman military engineers continued to use earthworks for permanent fortifications till after the reign of Hadrian, and that Severus "converted" some of these earthworks into stone.

The "vallum" can no longer be explained as of old, but it is still a puzzle. Many of its features have been elucidated by recent excavations. It has been definitely proved to be Roman, which certain despairing minds had doubted. Its course, not quite accurately known to Bruce and Hodgson, has been better traced. The method of its construction is now plain. Its date has proved to be not earlier than the turf wall; probably it is contemporaneous either with that or with the stone wall. Its object was not military: it must have marked some limit of the civil province. But more precise we cannot be. The "vallum" is one of the largest of extant Roman earthworks; speculation has busied itself about it for two centuries, and excavation for some years. It remains unexplained, a proof of the imperfection of our knowledge of antiquity.

The Wall of Pius consists of a continuous rampart, a ditch in front of it, forts behind it, and a connecting road; it was constructed about A.D. 142, and abandoned within 45 years. An ancient writer states that the rampart was built of regularly laid sods, like the turf wall of the southern frontier: this was verified by excavations in 1891–93. Except for this, the wall is entirely unexplored: a commencement of excavation was, however, being made in 1902 at the fort of Castlecary, 15 miles east of Glasgow. The site has been cut into by road and railway, and the stones of the fort have been taken away wholesale by later builders. But a bath-house, a buttressed storehouse, and a latrine have been found, and also massive stone substructures for the northern rampart. The surviving masonry is finer than that usually visible along Hadrian's Wall, and the work of Pius was plainly far more substantial than has been thought. Tacitus states that Agricola erected a line of forts across the northern isthmus. No trace of these has yet been found, unless possibly at Camelon near Falkirk, recently excavated by the Society of Antiquaries of Scotland.

No report of the Housesteads work has yet been published (July 1902); the writer is indebted to Dr Hodgkin and Mr R. C. Bosanquet for the plan, reduced from surveys by Messrs Bosanquet and Dickie. For other excavations, see *Archæologia Æliana*, vols. xvi., xvii., xxiii., xxiv.; *Transactions of the Cumberland Archæological Society*, 1894–1902; *Report of the Glasgow Archæological Society on the Antonine Vallum.*

(F. J. H.)

Romanes, George John (1848–1894), British biologist, was born at Kingston, Canada, 20th May 1848, being the third son of the Rev. George Romanes, D.D., professor of Greek at the university. He was educated in England, going in 1867 to Gonville and Caius College, Cambridge. He early formed an intimate friendship with Charles Darwin, whose theories he did much during his life to popularize and support. His first appearance as a man of science was at the Royal Society, where he delivered the Croonian lecture for 1875 on the *Locomotor System of Medusæ*, in which he described the nervous system of these little beings, thereby rendering valuable service to the study of elementary physiology. These studies he continued to prosecute, publishing a few years later a work on *Jelly-Fish, Star-Fish, and Sea-Urchins*. In 1881 came *Animal Intelligence*, in 1883 *Mental Evolution in Animals*, in which he traced the parallel development of intelligence in the animal world and in man. He followed up this line of argument in 1888 with *Mental Evolution in Man*, in which he maintained the essential similarity of the reasoning processes in the higher animals and in man, the highest of all. In 1892 he brought out an *Examination of Weissmanism*, in which he sturdily upheld the theory of the hereditability of acquired character. In 1890 he settled at Oxford. Here he founded a lectureship similar to the "Rede" of Cambridge. *Darwin, and after Darwin*, which came out in 1892, he was obliged, owing to failing health, to publish without fully completing. His religious opinions are somewhat interesting: he began life as an Evangelical, and then came under agnostic influences, to which he gave expression in an anonymous book, *A Candid Examination of Theism*, the tone of which is reluctant disbelief in the Deity. Subsequently he was much impressed by the teaching of liberal High Churchmen, and recovered his faith in Christianity. *Thoughts on Religion*, published after his death, shows how very far the pendulum of his mind had swung from the Evangelical and agnostic standpoints. He died 23rd May 1894.

Rome, the capital of the kingdom of Italy. Very great changes in the municipal and social conditions of Rome followed the occupation of the city by the Italians (20th September 1870), and the rapid increase of population due to immigration from other parts of Italy; and even in 1902 it could not be said that the new Rome had assumed its final shape. It is a mistake, however, to attribute all the works undertaken and executed since 1870 to the initiative of the new Government. A plan for the improvement of the city was made, under the direction of Mgr de Merode, during the reign of Pius IX.; and although but a small portion of the projected changes were carried out under the Pope, the general scheme was in most respects satisfactory, and proved a good foundation for further extensive developments. It did not include, however, the destruction of villas such as the Villa Ludovisi, nor the wholesale removal of trees, which is so greatly to be deplored. These acts of barbarism were the consequences of the reckless speculations in land and buildings that accompanied and followed the active and excellent work done by the municipality, and might have been checked by vigorous and timely action of the Government. As it was, a number of the most important Roman families were ruined. At the outset, and as soon as political circumstances admitted the consideration of such matters, the municipality set to work; and though a comprehensible love of the picturesque has caused many persons to regret the result, altogether or in part, it is not to be denied that the improvements carried out have been of the highest advantage to the city, and that the work is in many instances of creditable solidity. Two principal

problems presented themselves at once. By far the more important was the confinement of the Tiber in such a manner as to render impossible the serious floods which had from time to time inundated the city, often causing great damage to property and rendering the lower streets more or less impassable. There were floods which almost reached the level of the first storey near San Carlo in the Corso, and it was common to see the great Piazza Navona and the neighbourhood of the Pantheon full of water for days together during the winter. The interruption of traffic can be imagined, and the damage to property was serious. The other urgent matter was one of which the Government of Pius IX. had been partially aware, namely, the necessity for opening better thoroughfares between different parts of the city. In the Middle Ages the population of Rome had dwindled to twenty or thirty thousand inhabitants, who lived huddled together about the strongholds of the barons, and the modern city had slowly grown again upon the exiguous foundation of a mediæval town. The need for changing this condition of things, which had been felt under Pius IX., became overwhelmingly apparent as the population rapidly increased. That which under a continuance of the old Government might have been done by degrees during a long period, had to be accomplished in the shortest possible time, with means which, though considerable, were far from adequate, and in the face of stormy opposition exerted by many holders of real estate, the most important of whom were conservatively attached to the Papal Government, and resisted change for no other reason. In what was now done it is necessary to distinguish clearly between the work undertaken and carried out by the municipality, under considerable pressure of circumstances, and that which was done in the way of private speculation. The first was on the whole good, and has proved enduring; the second was in many cases bad, and resulted in great loss. As soon as the opening of such streets as the Via Nazionale and the Via Cavour, the widening and straightening of the Via dell' Angelo Custode, now the Via del Tritone Nuovo, and similar improvements, such as the construction of new bridges over the Tiber, had demonstrated that the value of property could be doubled and quadrupled in a short time, and as soon as the increase of population had caused a general rise in rents, owners of property awoke to the situation of affairs, and became as anxious as they had at first been disinclined to improve their estates by wholesale building.

By far the most important and expensive work done by the municipality was the construction of the embankments along the Tiber. Though damaged by the great flood of December 1900, their truly Roman solidity saved the city from the disastrous consequences of a wide inundation. It is impossible not to admire them, and not to feel respect for a people able to carry out such a plan in such a manner and in so short a time, in the face of such great difficulties. But so far as the life of the city was concerned, the cutting of new streets and the widening of old ones produced a more apparent immediate result. The opening of such a thoroughfare as the Via Nazionale could not but prove to be of the greatest value. It begins at the Piazza delle Terme, in which the principal railway station is situated, and connects the upper part of the city by a broad straight road, and then, by easy gradients, with the Forum of Trajan, the Piazza dei Santi Apostoli, and the Piazza di Venezia, whence, under another name, it runs through the heart of the old city to the Bridge of Sant' Angelo. It is true that in order to accomplish this, a part of Villa Aldobrandini had to be destroyed; but this is almost the only point which lovers of beauty can regret, and in compensation it opened to full view the famous palace of the Massimo family, the imposing church of Sant' Andrea della Valle, and the noble pile of the Cancelleria, one of the best pieces of architecture in Rome. Another great artery is the Via Cavour, which was intended to connect the railway station with the south-western part of Rome, descending to the Forum, crossing it by a light iron bridge, and continuing to the river behind the Palatine. These are only examples of what was done, for it would be impossible, within any ordinary limits, to give a just idea of the transformation of the city. Rome is now divided very clearly into two parts, the old and the new, of which the old is incomparably the more artistic and the more beautiful, as it will always remain the more interesting.

Municipal Administration.—After the taking of Rome, those persons who remained loyal to Pius IX. took no part whatever in public affairs, and the municipal administration was entirely in the hands of the Monarchists. The expression "nè eletti nè elettori," meaning that Catholics are to be neither voters nor candidates, which came to be regarded as a sort of rule of the party, was invented at that time by an epigrammatic journalist, and it seems at first to have been applied also to municipal matters, whereas it was later understood to refer only to parliamentary elections. Leo XIII. encouraged the formation of a Catholic party in the municipal administration, and the municipal government drifted largely into the hands of Catholics, though circumstances make it necessary that the Syndic (Mayor) should always be a Royalist. Between 1870 and the end of the century, the Socialist party had no great influence in Rome, which can never be a city of manufacturing interests. For purposes of municipal government the division of the city into districts has been changed. It was formerly divided into fourteen "Rioni." It is now further divided for various purposes of administration into more than one series of divisions. The municipality consists of a Mayor and 78 "Communal Councillors," of whom a considerable proportion are usually members of the aristocracy—a fact which shows the extremely conservative and aristocratic tendency of the city in municipal matters.

Population.—The population on 31st December 1870 was 226,022, as against 512,423 on 31st December 1899. It therefore more than doubled in thirty years. The increase, however, did not take place at a very regular rate, owing to the changes in the rates of immigration and emigration. The largest increase was in 1870, reaching 22,186; the next most important in 1884, 1885, 1886, 1887, in which years it constantly remained near 20,000. The least increase in later years was 4417 in 1891. In 1899 it was 11,813. The garrison of Rome may be taken at about 10,000 men. Careful inquiry has placed it beyond doubt that there are in Rome about the same number of ecclesiastics of all orders, including about 1500 students in the theological seminaries. The average birth-rate of Rome is about 22 per 1000, as against 13½ in Budapest, the lowest in Europe, about 30 in London, and 40 in Cologne, the highest in Europe. It is lower in Rome than in the majority of cities, but is higher than in a considerable number of others, as shown in the *Bulletin de statistique démographique et médical de la Ville de Bruxelles.* The number of births increased after 1870 very nearly in proportion with the increase of population.

Hygiene.—The hygienic conditions of Rome have greatly improved, largely through the ceaseless efforts of Commendatore Baccelli, who is a distinguished man of science, and has repeatedly held office in the Italian Ministry. The publication of exceedingly accurate graphic tables in February 1900 shows the following facts. Ninety per 1000 deaths occurred in 1871 from typhoid (the so-called "Roman fever"), and the average has now fallen

to a low constant. Deaths from small-pox, formerly of alarming frequency, can be said not to occur at all, and their numbers diminished suddenly after the introduction of compulsory vaccination. A great decrease in the number of deaths from malarial fevers is referred to the increased use of quinine among the poor in the outlying districts. Tuberculosis alone produces precisely the same mortality as formerly. On the whole, the tables show a notable decrease in the death-rate, which has now fallen below an average of 18 per 1000, a fact which places Rome among the healthiest cities in Europe. The death-rate of Moscow is nearly 30, for instance, and that of Dublin about 26. With regard to the consumption of meat in Rome, it increased until 1887, after which it suddenly decreased in a remarkable manner, coincidently with the failure of the numerous building speculations; and though the population had increased by nearly 120,000 since 1887, there were slaughtered in 1899 only 116,661 head of cattle, whereas the number in the former year was 140,549, showing a decrease of 23,888 head. In this connexion it should be noted that the slaughter-house of Rome is one of the best organized establishments of the sort in Europe.

Charities and Education.—A great number of small charitable institutions for children and old people have been founded, which are organized on the most modern principles, and in many of these charitable persons of the upper classes give their individual assistance to the poor. There are also private hospitals for diseases of the eye, in which poor patients are lodged and treated without payment. There are two hospitals entirely maintained by private resources, where infants are treated whose mothers fear to send them to a public hospital, or in cases refused by the latter as not being serious enough for admission. Of course the numbers of the poor greatly increased with the growth of population, especially after the failure of building speculations between 1888 and 1890, though great efforts were made by the municipality to send all persons then thrown out of employment back to their homes. One of the difficulties under which Rome labours is that while it attracts the population of the country, as other capitals do, it possesses no great mechanical industries in which the newcomers can be employed. Efforts to create small industries in the populous quarters of the poor met with little success. Previous to 1870 a society was formed, and it has since greatly developed as an intelligent private enterprise, of which the object is to provide the poor with sanitary tenements; but its success is much hampered by the absence of employment, which, again, is partly due to the heavy taxation of small industries. A number of trade schools are also maintained by private funds, such as the Istituto degli Artigianelli, managed by the Fratelli della Dottrina Cristiana, and the Ricovero pei Fanciulli Abbandonati (home for friendless children), which is under lay management and has flourishing workshops. The character of official charities has certainly improved in principle, so far as their educational and moral scope are concerned; for whereas in former times the limited number of the poor made individual and almost paternal relief possible, that form of charity had a pauperizing influence. If anything, the present tendency is to go too far in the opposite direction, and to require too many formalities before any relief is granted; and while the union of the principal charities under a central management on advanced theories improved the methods of administration, it destroyed numerous small sources of immediate relief on which the poor had a traditional right to count, and was in that way productive of hardship. At the same time, however, mutual benefit societies (*società di mutuo soccorso*) have been organized in great numbers by the different crafts and professions, and are chiefly distinguishable by the political parties to which they belong. It is characteristic of the modern Roman people that the most widely different elements subsist without showing any signs of amalgamating, yet without attacking each other. Some of these societies have an exclusively Clerical character, others are merely Conservative, some consist of Monarchists, and some of avowed Republicans.

Popular education is fully half in the hands of private persons, for, over and above the schools officially mentioned in the municipal reports, a very large number of religious institutions impart elementary instruction to children of the lower classes, following, of course, the Government curriculum, and being under the supervision of municipal inspectors both as regards their teaching and their hygiene. The Pope also expends large sums in the maintenance of the people's schools, managed entirely by laymen and also under Government inspection. For education of the higher grade there are many private so-called lyceums and gymnasiums, from which pupils can present themselves for the regular Government examinations, the privilege of conferring certificates and degrees having been allowed only to very few private institutions.

Society.—After 1870 both the aristocracy and the middle classes were divided into hostile factions, each of which maintained a press of its own and rallied round representative individuals. So far as the middle classes were concerned, the common interest of commercial operations soon concentrated political differences. The aristocracy, however, kept rigidly aloof from all speculations for a time, and maintained its traditional attitude of contemptuous superiority, to which the middle class answered with its profound hatred. This state of things lasted about ten years, until the time of the great building speculations, into which a number of noble families were tempted, and in which they soon found themselves hopelessly involved, and brought into close contact with the middle class. The two classes thus became necessary to each other, and the result was a notable and salutary diminution of prejudice, soon leading to alliances by marriage which would formerly have seemed impossible, but which the redistribution of wealth rendered mutually advantageous. The appearance at social gatherings of an official element, almost exclusively taken from the middle class, also tended to reduce inequalities of caste. Yet it must be admitted that the parties composing Roman society were drawn together mechanically, rather than fused into anything really homogeneous. It is worth mentioning that the Jewish element, which is very strong in business, in journalism, and in the administrations, has made no attempt to enter Roman society. Rome and Genoa are practically the only Italian cities in which Israelites are rigidly excluded from social intimacy, and are only met on official occasions.

(M. CR.)

Archæology of Rome and Neighbourhood.

Modern archæological research in Rome and its neighbourhood has proceeded on lines previously traced, and has considerably increased knowledge of the early inhabitants and conditions of life in and about the city. Single buildings and groups of buildings within the walls have been searchingly studied in the effort to elucidate their original form and use, a branch of research particularly valuable in Rome, where continuous habitation and events of war have caused many ancient buildings to be diverted from their original forms and purposes. Excavations connected with the rapid growth of the modern city have, moreover, brought to light an enormous number of the

most varied objects, for the preservation of which, as for the preservation of the results of carefully directed research, several museums, some of purely scientific character and others with artistic intent, have been formed. In most cases the archæologists entrusted with excavations and with the formation of museums have been moved by desire to work in ways fully consistent with modern knowledge and methods. Unfortunately, in some noticeable instances (to be mentioned later) the work was unworthily done, either carelessly or hurriedly, under the influence of momentary excitement.

It was inevitable that the great development of the city should involve much destruction of ancient ruins and monuments. In consequence of the building of the Tiber embankment and scientific regulation of the course of the stream, the channel to the left of the island of San Bartolomeo became filled with silt and joined to the bank by a noisome mud-flat.[1] The Ponte Sant' Angelo has been added to at each end, and its ancient appearance altered. During the work on this bridge in 1892 a piece of the original paved roadway leading from it to the Campus Martius was laid bare. Most of the other bridges have been more or less destroyed, two of the arches of the Pons Æmilius being demolished in 1887, and the Pons Cestius completely altered between the years 1886 and 1889. Fragments of the Servian Wall and tombs on the Flaminian Way were further destroyed in connexion with the building of the monument to Victor Emmanuel. More than once portions of the Golden House of Nero were found and destroyed during the laying out of streets. Outside the walls, the arches of the Claudian Aqueduct near Roma Vecchia were much shaken by the passing trains. In addition to this perhaps inevitable destruction, harm was done by certain methods of preservation. Quantities of unrelated objects from all parts of the city and neighbourhood were heaped together in storehouses, in such a way as to deprive them of value as expressions of ancient life and character, and to make them mere curiosities, mere refuse of "past, incompatible ages." The formation of modern museums is carried out in a spirit very different from that which prevailed when the great private collections or the Papal Galleries were being gathered. Then scientific study of archæology was almost unknown, but much greater interest was taken in beauty *per se*. Humanists cared little for products of barbaric ages, or tribes, and sought objects noteworthy especially for beauty, both in order to develop their own faculties and to multiply opportunities of enjoying adequate expressions of the intellectual life of the highly civilized men of earlier days. Judged by this standard, a modern museum such as the Museo delle Terme seems less satisfying than the Vatican Gallery. In the Museo delle Terme objects are grouped together without system, or scattered through the dark cells and narrow passages of a mediæval convent, where not only is it impossible to see them in the way their makers intended, but even to see them in any way completely. In the Vatican, though the marbles suffered from ignorant restoration, an attempt was made to present them in a proper setting as things of beauty rather than as examples of odd fashions of the past. It would often be well to leave objects where they are found, and to form local museums, or at least to gather on one spot things found together. For instance, it would have been well to make a museum on the Palatine and another in the Forum, for the preservation of antiquities found on those sites, instead of transporting some of them to the Museo delle Terme and leaving others where they were excavated. An attempt in the right direction was made by Signor Boni in connexion with the excavations in the Forum, where two small museums were formed. The general system of scattering antiquities among various museums prevailed, however, in the case of objects found elsewhere in the city. Some were stored at the Botanic Gardens, some in the Museo delle Terme, and some in the Museo dei Conservatori. The authorities had, it is true, to contend with the serious difficulty that, according to the circumstances of their discovery, antiquities may belong to the municipality or to the State; yet this circumstance ought not to form an insuperable obstacle to intelligent arrangement.

A more serious ground for complaint came to light in 1899 in connexion with the Papa Giulio Museum of Etruscan Antiquities. Doubt as to the scientific value of the museum was expressed by Professor Helbig in the preface to the second edition of his guide to Roman museums. Inquiry conducted by three Government commissioners (two of whom held offices under Professor Bernabei, organizer of the museum) proved: (1) That, contrary to the public statements of two Ministers of Public Instruction, the Etruscan tombs, to hold the contents of which the museum was formed, had been excavated without proper supervision, and in large measure by a "boy scarcely fifteen years old." (2) That the published plans and maps could not be certified because, with one exception, all the original topographical notes had been destroyed. (3) That the directors of the museum "did not always act in a praiseworthy manner." (4) That no proper inventories of objects bought for the museum were kept for ten years, and that lists actually forthcoming were inaccurate. (5) That in the case of some twenty tombs the objects exhibited did not tally with the official descriptions of them (*Supplemento al No. 23 del Bollettino Ufficiale del Ministero dell' Istruzione Pubblica*, June 1899). It therefore became evident that the value of the Papa Giulio Museum, as a co-ordinated illustration of the development of Etruscan civilization, is open to serious question.

While so many famous private collections were sold and scattered, two collectors at least gathered objects of interest and beauty with the declared intention (at any rate in the case of one of them) of giving them to their country. One of these is King Victor Emmanuel III., whose collection of Italian coins is unrivalled; the other is Baron Barracco, who has collected choice marbles, selecting them for their artistic excellence rather than for archæological peculiarity (see *La Collection Barracco*, by Helbig, text and plates).

Intimately bound up with the questions of the management of museums, and their arrangement in such manner as to offer facilities for study to properly accredited students, are the problems of scientific excavation and of disposal of important private collections which may come into the market. The various foreign archæological institutions having headquarters in Rome are refused permission to excavate in Italy, although there is vastly more work to do than the Government can possibly undertake, and though permission to excavate is freely given to similar institutions by Greece, and even by Turkey. The attitude of the Italian Government delays the progress of knowledge, prevents the formation of local museums, allows much harm to be done by untrained Italian antiquity dealers, to whom excavation rights are often granted, and who dig merely to find [illegible] to sell, induces much secret digging, and keeps money out of the country. In cases like those arising from the purchase *en bloc* of the Borghese and Boncompagni collections, which contain some masterpieces and much second-rate work, the problem is complicated by the fact that the collections were formed, at least in part, as a public trust. The Government thus possesses the right of pre-emption, but, considering the innumerable treasures already in the various Government museums, would it not be well to let a permanent board of properly trained experts select the objects of

[1] In consequence of the fall of a part of the embankment opposite S. Bartolomeo in November 1900, a special commission was appointed to consider the best means of removing this mud-flat, and of causing the stream again to surround the island, as in former times.

most moment, and sell the remainder at a Government office, as in Egypt? One other question calls for brief notice, namely, the rights of foreign students to study and publish results of research. No one can wish to place foreign students in a more favourable position than native scholars, but the Italian authorities are often slow in publishing proper accounts of discoveries, and unwilling to let foreigners make photographs, or even take notes, of objects exhibited in the museums. It is an exaggeration to say, "We are most liberal in allowing strangers to study the archæological riches excavated and arranged by us, and we favour their researches in every possible way" (*Supplemento al No. 23 del Bollettino Ufficiale del Ministero dell' Istruzione Pubblica*, June 1899).

Excavations in the Forum.

The most important modern excavations took place in the Roman Forum under the direction of Commendatore Giacomo Boni. They began tentatively in September 1898 with the re-erection of a little 3rd-century shrine at the north-west angle of the Atrium Vestæ. The plan adopted by Boni in regard to reconstruction was simple and wise. When large portions of a monument have been preserved and their original positions known with certainty, it is better to replace them in their true relation with each other, supplying missing portions with materials that cannot mislead, than to leave them lying on the ground in unintelligible disorder and liable to injury. From this beginning the work was extended by degrees to the whole Forum. The discoveries were so varied, and in some cases so significant, as to necessitate the re-writing of all existing literature on this part of Roman archæology. The principal modifications and discoveries were as follows:—

Honorary Columns, which formerly stood opposite the Basilica Julia, but of which the chief portions were lying where they had fallen, were in two cases reconstructed and raised on their bases.

Heroon of Cæsar (October 1898). It was manifest that the remains of this temple had not been completely cleared of earth by earlier excavators. This was now done, and in the semicircular recess of the front wall was found the base of the altar erected on the pavement of the republican Forum on the spot where Cæsar's body was burned. The foundation walls were traced, and the temple shown to be larger than previously supposed.

Arch of Augustus.—Lower blocks of the piers, found but not recognized some years ago, were replaced in their original position.

Temple of Vesta.—The shapeless mound previously called by this name proved to be in large part simple earth. This was removed, and in the centre, below the level of the temple floor, was found a trapezoidal chamber of early date, rebuilt (like the temple above) in later times. In the chamber, which was probably the *favissa*, was found a quantity of fragments of vases, bones (ox, dog, sheep, and pig), charred oak, and ashes.

House of the Vestals (September 1899).—Much earth was cleared away, mosaic floors laid bare, and the lower steps of the stairs leading to the second floor discovered. A hoard of 397 *solidi aurei* was found. The coins were mostly of the 4th and 5th century A.D.; ten were of Euphemia, wife of Anthemius. One republican and three mediæval wells were emptied, and an early altar with traces of sacrifices brought to light. The sewers were found to be full of oyster-shells and of various objects used by the Vestals.

Regia (May–August 1899).—The foundation walls were more accurately traced than before, and various fragments of the last (imperial) reconstruction collected. The basis of what may have been the *sacrarium* for the sacred spears of Mars was unearthed, and a subterranean beehive chamber of large dimensions discovered. This chamber, or *tholus*, which had a thick external coating of fine clay and an internal coating of cement, contained, among other objects, seventy-eight bone styluses, a bone writing-tablet, and a piece of well-kerb with the word "Regia" inscribed in republican characters.

Domus Publica (September 1899).—Cleared and examined more accurately than before, mosaic floors (previously known) cleaned and examined, and the *impluvium* found.

Temple of Castor and Pollux (August 1899–January 1902).—The standing columns, which were in great danger of falling, were strengthened; many architectural fragments, previously scattered heedlessly about the Forum, were gathered together; the western side of the stylobate and the foundations were excavated. The excavation was carried round the temple.

Vicus Tuscus was cleared of mediæval paving-stones, and a short stretch of curious pavement, composed of small brick *tesseræ*, like a mosaic, brought to light.

Arch of Fabius (1899).—The exact site of this arch was not found, but three large *voussoirs* of travertine belonging to it were discovered opposite the Heroon of Romulus underneath the previously existing modern pavement, on the line of the Sacra Via. The arch is thus shown to have been larger than hitherto supposed, and to have had a span at its spring 4·58 metres wide. One republican and three mediæval wells were found near by, one of the latter containing, among other things, three large weights of serpentine with bronze handles. Their excellent state of preservation makes them valuable material for the study of Roman metrology.

Forum Pacis (1899).—Cleared of earth and made accessible from the Forum Romanum, in such way as to render visible the well-known door in the eastern side of the Templum Sacræ Urbis and the side of the Basilica of Maxentius (Basilica of Constantine). Some four hundred fragments of the marble plan of Rome which was affixed to the northern wall of the Templum by Septimius Severus were found in April 1899 behind the Farnese Palace.

Temple of Antoninus and Faustina (June 1900).—The modern stairs in front were removed, and the core of the original steps exposed. The lower half and the head of a statue of a seated female figure and another early well were found. Under the ancient steps a grave, dating probably from the 8th century B.C., was found. Its contents were not remarkable, but it shows that at that epoch the Forum was outside the city boundaries. The town was probably limited at that time to the Palatine.

Via Sacra (June 1899).—The finding and clearing of a large early sewer built of *opus quadratum* and *opus reticulatum*, running under the so-called Via Sacra, prompted further exploration, which proved the pavement, hitherto considered ancient, to be of mediæval or of even later date. Several pieces of mediæval carving and coins, some of the 16th century, were found below this pavement; also pieces of the porphyry columns which once stood at the southern entrance of the Basilica of Maxentius. Several republican wells were discovered, containing many small objects of bronze, bone, terra-cotta, or stone. In two mediæval wells several carved marble fragments were found. About two metres below the above-mentioned pavement an early imperial pavement of large, well-laid, polygonal blocks came to light. A continuation of this pavement was also found immediately under the Church of Sta Francesca Romana, thus showing that the Sacra Via originally ran due east from the Forum, a circumstance which suggests that the Arch of Titus is not now standing in its original position.

Horrea Margaritaria (spring 1900).—Deeper excavations than those previously made on this site revealed the existence of buildings earlier than the imperial constructions hitherto known. Many small objects of various materials were found among them, fragments of Aretine pottery, and some three hundred terra-cotta lamps of diverse patterns.

Basilica Æmilia (begun spring of 1899).—This was one of the first large undertakings, and its success led to the continuation of Signor Boni's work. It was necessary to expropriate a block of houses which partly covered the site, and this expense was borne by an Englishman, Mr Lionel Phillips. The southern half of the Basilica was cleared, and work gradually proceeded with. Although the Basilica was rebuilt at various times, it is now a complete ruin. Nevertheless, much has been learned concerning its character. The plan consisted of a nave, with aisles on each side running east and west, surrounded by a colonnade. Several important inscriptions and architectural fragments were found, including portions of the large pillars of African marble (about 3 feet in diameter and 30 feet high) which separated the nave from the aisles. These columns show that the *pavonazzetto* pillars in St Paul's outside the Walls were not, as was previously believed, taken from the Basilica Æmilia. Traces of many partial reconstructions have been found, the last having apparently been executed in the time of Theodoric. The final destruction of the edifice was due to fire.

Niger Lapis (spring of 1899).—On 10th January 1899 a square pavement some 12 feet by 12 in extent, composed of thick slabs of black marble veined with white, was discovered at a short distance from the front of the Arch of Septimius Severus. The objects found below this pavement are convincing proof that it is the "black stone" mentioned by Festus as marking the spot where, according to tradition, Romulus was buried (cf. also *Schol. Crug. ad Hor. Epod.* xvi. 13; *Dion. Hal.* i. 87). Beneath the "black stone" are two bases on which, in all probability, stood the two lions known to have been near the Tomb of Romulus. Close by, also under the "black stone," were discovered a (hitherto unexplained) cone shaped shaft of tufa and a *cippus*, of which the upper half had been destroyed. On the four sides of this *cippus* was a Latin inscription, perhaps of the 6th century B.C., which, so far as it can be deciphered, relates to sacrificial ritual. Around these monuments lay a thick stratum of sacrificial remains, in which were found, among other objects, half a dozen finely worked bronze figurines, similar to the Apollo of Tenea.

Comitium (January–November 1900).—The various strata, more than twenty in number, were carefully examined down to the

original geological stratum. Each of the principal epochs was characterized by a different flooring—the mediæval of travertine, the imperial of marble, the republican of tufa, and others perhaps of beaten earth. Many inscriptions and statue bases were found, among the latter being one dedicated to Mars and to the founders of the Eternal City by Maxentius on 21st April 308 A.D., the anniversary of the foundation of Rome. Four rows of ritual pits (22 in all) of the republican epoch, and set according to the early orientation of the Forum, were found in front of the Comitium, but, unfortunately, contained little of special interest.

Cloaca Maxima (August 1899–September 1900).—When, after exploring the Comitium and the Basilica Æmilia, the outside of this sewer was uncovered, it become evident that it was built of blocks taken from republican buildings, and that its date could not be anterior to the time of Agrippa. A large drain, perhaps two centuries older, was found under the Basilica Æmilia, together with another massive sewer, which may be the original Cloaca Maxima. This latter is made of rough-hewn blocks of tufa, and has rather the appearance of a walled-in stream than that of a regular sewer.

Rostra (December 1898–November 1900).—Some discoveries of great interest were made, although not entirely explained. Signor Boni shows reason for the belief that he has found traces of the original Rostra near the "black stone." He also advances convincing architectural proof that the construction considered by Middleton and others to be the Rostra built by Cæsar in 45 B.C. was really built in the time of Domitian, with, as was already known, an addition at the northern end dating from the 5th century A.D. Behind this construction is a curved platform, sometimes called the Græcostasis, to the rear of the southern half of which Signor Boni found another construction of *opus incertum*, consisting of barrel-vaulted niches some 5 feet high, with carefully laid floors of brick *tesseræ* and piers and archivolt of neatly cut well-set blocks of tufa. The whole structure, except the floors, was covered with stucco. The materials and the excellent method of construction show the monument to date from the republican epoch. The arches suggest that it may be the Rostra shown on the famous Palikanus coin of the *gens Lollia;* but one serious difficulty lies in the way of this explanation, namely, the absence of all trace of an attachment of the *rostra* either within or without the arches. It is to be noted that the traces of the Miliarium Aureum, placed by some students on the spot where this arched structure was found, can never have existed. There was no evidence to justify, and many architectural reasons against, the belief that the curved mouldings in this locality had anything to do with the monument. Nor is there the slightest evidence that the fragment of granite column was, as it has been asserted to be, part of the shaft of the *miliarium*.

Fountain of Juturna.—This fountain and the *sacrarium* connected with it were found on the precise spot indicated in the marble plan of Rome, slightly to the south-east of the Temple of Castor and Pollux. The square basin in which the water from the spring was collected was in early times made of tufa, and was larger than the marble-lined basin of the imperial epoch. Ample traces of both basins were found. On a high level, somewhat to the south of the fountain, stood the *sacrarium*, in front of which was found a well, the marble kerb of which bears a dedicatory inscription of the Curule Ædile, Marcus Barbatius Pollio. The water ran to the well through a leaden pipe from the basin of the fountain. The *sacrarium*, though of late construction, has the orientation of the earliest buildings in the Forum. Several fragments of sculpture were found on this site, by far the most important being pieces of the group of Castor and Pollux, with their horses. This group formerly stood in the middle of the basin of the fountain, upon a base of which traces exist. The spirit of the sculptures is that of 5th-century Greek work, but certain details of treatment make it probable that they were executed by some Italianized Greek from one of the numerous Greek colonies, or by some native trained by Greek masters, as were the terra-cotta decorations of the temple of the Capitoline Jupiter.

Palatine Basilica (begun in June 1899).—Discoveries made since the demolition of the modern Church of Sta Maria Liberatrice (recently expropriated by the Italian Government) settled the controversy as to the site of Sta Maria Antiqua. A fine imperial basilica, built probably by Domitian and afterwards converted into a church, was unearthed. Inscriptions prove this to have been the Church of Sta Maria Antiqua, which, according to the *Liber Pontificalis*, was decorated by John VII. (795–707). By him also the *ambon* was made, and an episcopal residence erected close by. Within the basilica Signor Boni has found an inscription in Latin and Greek, in which Pope John VII. calls himself "Servant of the most holy Mary"—the same title as is inscribed on his tomb in the Sacre Grotte of St Peter's. The outer of the two halls of which the church consists contains many mural sepulchres, and was probably considered as an *atrium*. Between this *atrium* and the shrine of Juturna, at right angles to the left side of the church, is a chapel which frescoes show to have been dedicated to the Forty Martyrs, and which may possibly have been the *secretarium*. The interior of the main building is covered with frescoes of the 8th century in remarkable preservation. Among them are rows of saints of the Greek and Latin Churches, conventional religious groups, scenes from the lives of saints and of Biblical characters. The most interesting are portraits of Popes Paul I. (757–767), Zacharias (774–752), and Theodotus, uncle of Hadrian I. The best preserved of the frescoes is a Crucifixion, practically uninjured, and as fresh as the day it was painted. This church, which was decorated and endowed with precious objects by many Popes (cf. *Liber Pontificalis*, Leo III., Benedict III., and Nicholas), was after the time of Nicholas called Sta Maria Nova. In 1702 the site was dug over by men hunting for marbles, and parts of the paintings were seen, but the erection of the modern Church of Sta Maria Liberatrice on the spot prevented thorough investigation, and gave rise to many theories. The facts are at last known.

Results.

The importance of the work in the Forum is obviously very great. During the searches marble and bronze objects, some of beauty and many more of great historical interest, were found, together with a number of valuable inscriptions. Much was learned concerning the history of the Forum, and after many centuries the position and ground-plan of the most ancient buildings is known with reasonably complete certainty. In other parts of Rome two monuments were subjected to critical study. One is the Pantheon (see Luca Beltrami, *Il Pantheon*, 1898), which, by the presence of certain brick-stamps throughout the edifice, was proved to be of the time of Hadrian. The other is the Church of Sta Maria in Cosmedin, which is built above an ancient temple of Ceres. It was freed from all Renaissance and later additions, and restored to its 12th-century form. In places the early temple walls can be seen; in others, 4th and 6th century structures can be detected; but as a whole its form and its interesting frescoes are of the 12th century. It is no light task to sift the mass of explorations and discoveries in Rome and neighbourhood, or to gain a clear view of archæological progress in this part of the world. Certain broad features are to be noted. Just as the modern city has lost much of the charm of the years before 1870, so the character of archæological study has largely changed. The old school of students, who, with fewer objects to consider, had more time to think, and who sought rather to grasp general points of view than to burden their minds with particular facts, has given way to a class whose work partakes of the nature of catalogues, and who lengthily debate the value of scattered fragments. It is no longer common to find private individuals collecting the objects of beauty and interest which continually come to light; nor are public collections governed by any understanding of the meaning and proper treatment of works of fine art. Not unfrequently they appear to aim at exhibiting to a restless public mere masses of dull, unrelated material. Doubtless much work of detail was necessary, and must be regarded as an inevitable consequence of the valuable modern contributions to knowledge; but the question arises whether such work may not engender a tendency to seek entertainment in a maze of detail, and to forget the value of fruitful and inspiring generalization. It is often said with truth that the ancients knew less than we about the development of themselves and of their arts; but of what value is such knowledge as compared with their power to carve the splendid portraits of Egypt or the thrilling masterpieces of Greece?

Accidental finds.

Among the antiquities discovered in a semi-accidental manner are the various objects and remains found during the construction of the forts encircling the city. In 1877 (see *Notizie degli scavi*, p. 311) tombs were found on the Via Appia, and a reservoir on the Via Gianicolenzi, outside Porta San Pancrazio. In 1878 (*ibid.* pp. 38, 134–369) more tombs were found on

the Via Appia. In 1883 (*ibid.* pp. 130, 422) a mausoleum with statues and inscriptions was found on the Via Ostiensis; these objects were of little beauty but of considerable interest. In the same year a somewhat elaborate system of water-works was found on the Via Latina. In 1884 (*ibid.* pp. 43–81) a large villa was discovered on the Via Tiburtina. It was in fairly good condition, and many of the patterns of the mosaic floors and the designs of the stuccoed walls could be made out; statues of Apollo and Æsculapius were also found here. The most interesting discoveries were made in 1881 (*ibid.* p. 60; and Lanciani, *Ancient Rome*, p. 28) and in 1887 (*Notizie degli scavi*, p. 64). In the former year the military engineers working on the summit of Monte Mario came upon the burial-chamber of the family of Minicia Marcella, the friend of Pliny the Younger, by whom she was charmingly immortalized. The burial-chamber, some 26 feet square, was of simple construction, with brick floor and stuccoed walls. In it were six sarcophagi, beside which stood an urn with an inscription declaring it to contain the ashes of the mother of Pliny's girl friend, and in the centre of the room a marble slab with the inscription D. M. (MINICIÆ) MARCELLÆ FUNDANI F. VIX. A. XII. M. XI. D. VII. In 1887 a fort was planted on the site of Antemnæ—the *turrigeræ Antemnæ* of Virgil (*Æn.* vii. p. 631). The site mentioned by various ancient authors (Strabo v. 3; Dionysius i. 17. 11. 35; Plutarch in *Sulla* 30 and *Varro* v. 5, who explains the name, *quia ante amnem qui influit in Tiberim*) was already known, although no visible traces existed, and it had not been explored. Some rudely made stone objects found during the construction of the fort probably date from the earlier periods of the history of Antemnæ, when it was a member of the league formed against Rome after the rape of the Sabines. Portions of an early wall made of tufa without cement, some wells and reservoirs, bronze pins and rude terra-cotta vases similar to those found in the archaic tombs on the Esquiline Hill in Rome, were discovered on the site; though not of special importance, they afforded clear indications as to the original character of Antemnæ. In imperial times a villa was built there (as on other similar sites). During the construction of the forts many remains of terra-cotta antefixes and life-sized human figures, with which the villa was decorated, were brought to light.

In September 1880 several bronze busts of the 1st century, and other bronze objects, were found during the excavation of the foundations of the English Church in Via Babuino. These objects were dispersed by antiquity dealers. The same fate befell several fine bronzes and marbles found about the same time at the corner of Via Nazionale and Via Santa Eufemia. In 1884 a burial-chamber with nine sarcophagi, decorated with exceptionally beautiful carvings, was found on the Via Salaria (see *Bulletin de l'Institut de Correspondance Archéologique*, 1884–85). The sarcophagi were those of Cn. Pompey, Licinius Crassus, Calpurnius Pisonis Frugus, Scribonius Libo, and others of the same families. Concerning these persons, it is known that M. Licinius Crassus and his wife Scribonia were condemned to death by the Emperor Claudius; Cn. Pompey, son-in-law of Claudius, was put to death at the instigation of Messalina; L. Calpurnius Piso Frugi Licinius was adopted by Claudius in the presence of the Prætorian Guard, and by the same guard put to death a few days later. Among the scenes carved on the sarcophagi were: The Triumph of Bacchus, Bacchus and Ariadne, Rape of the Daughters of Lucipus, Childhood of Bacchus. Of this most interesting set of sarcophagi, one is in the Museo delle Terme, and the others in the collection of Don Marcello Massarenti.

Numerous and interesting sculptures were found on the sites once occupied by the gardens of Mæcenas and of Sallust. Portrait busts, fountains, original Greek works of various dates, in relief or in the round, and copies of Greek originals, suggest that these gardens were, in fact, museums. The throne of Aphrodite, which has been bought by the Government, with the rest of the Boncompagni collection, was found in 1887 in the gardens of Sallust. This is perhaps the most beautiful piece of Greek bas-relief of the early 5th century in existence. A similar and even better preserved throne, discovered at the same time and place, was sold by the antiquity dealers. Several of the works found in these gardens were sold to foreign purchasers. In 1884 two colossal bronze statues, probably of the 2nd century B.C., were found in digging the foundations of the Teatro Nazionale. One is a seated figure of a pugilist, and the other a standing figure of a man. Both are in perfect preservation, and are fine examples of a coarse but powerful school of art. In 1887 a fine though imperfect replica of the Apollo Barberini was found in the Prati di Castello. It is now in the Museo dei Conservatori. In 1899 a good copy of a very fine statue of Apollo of the early part of the 5th century B.C. was brought out of the Tiber. The river continues from time to time to give up works of the greatest interest. Several other works were discovered in making the foundations of the monument to Victor Emmanuel II., and in 1897 a broken copy of the Athena of Velletri was unearthed in Piazza Sciarra. This summary description of objects accidentally found from time to time in Rome will serve to convey an idea of the vast amount of sculpture buried within the city. Those which have not been bought by foreigners are placed in the Museo delle Terme, the Museo dei Conservatori, or the Magazzino Archeologico.

Under the following headings we give a summary of the progress made in elucidating the archæological interest connected with various sites near Rome:—

Excavations at sites near Rome.

Alba Longa (see Ashby, *Journal of Philology*, vol. xxvii.).—In the light of modern knowledge, and with the advantage of discussion with Professor Lanciani, the chief authority on the Campagna and neighbourhood of Rome, Mr Ashby reviewed the various theories propounded with regard to the site of Alba Longa. He decided in favour of Castel Gandolfo (see Tomasetti, *Campagna di Roma nel medio evo*, 1–587).

Conca (see *Notizie degli scavi*, 1896, and *Mélanges d'Archéologie et d'Histoire*, 1896).—Nibby (*Analisi della Carta dei dintorni di Roma*, p. 748 f.) believed this place to be the site of the ancient town of Satricum, and excavations carried on in 1896 have shown this belief to be well founded. Satricum is not often mentioned by ancient authors (see Livy, vi. 22, vii. 27, xxviii. 11; Diodorus xiv. 102; Pliny, *Hist. Nat.* iii. 5. 9). But it is clear that the town was famous for the Temple of Mater Matuta. Though Satricum was twice destroyed, the temple seems not to have suffered, probably because it stood outside the actual city limits. This inference is borne out by the results of excavations, which were undertaken privately by the late Count Tyskiewicz, with the help of students from the French School of Rome. The site explored was at Conca, one of the largest properties in the so-called Agro Romano, and situated in a marshy region south of the Alban Mountains. After five weeks' work, notwithstanding the great interest of the results obtained, operations were suspended, by order of the Government, because "it was necessary to confirm the rule that in Italy no archæological explorations are to be made by foreigners, not even by scientific schools or societies" (see *Supplemento al No. 23 del Bollettino Ufficiale del Ministero dell' Istruzione Pubblica*, Rome, 10th June 1899). The excavations, as far as they went, made it clear that the temple was more than once reconstructed. The earliest form of which traces were found dated from the 7th century B.C. The temple was then built of red tufa, with an orientation from east to west, the columns, used only in the portico, being of heavy proportions and of the Tuscan order. In the following century the temple was enlarged and rebuilt on a more elaborate plan, with a whiter kind of tufa and a somewhat different orientation. This second temple was probably made peripteral, and was elaborately decorated with terra-cotta figures

and ornaments. Large quantities of these ornaments were found, mostly painted with white, red, and black. The figures were in bold relief, and apparently formed a frieze, of which the subject cannot be made out. Possibly it consisted not of one subject only, but of a series of groups, one of which represented the not uncommon scene of a satyr embracing a nymph. Besides the figures, many antefixes, with relief heads, and many geometrical designs were found, some painted and some consisting of open-work patterns, like those discovered at Civita Castellana. The subjects represented, the heavy proportions of the figures, and their bold but loose modelling, show the work to be akin to the branch of Greek art called Ionian. The artists were evidently trained on Greek models by Greek masters; in no sense did they produce true Etruscan or Italian work.

Gabii (see *Notizie degli scavi*, 1885).—The usually good results obtained when this site was partially explored by Gavin Hamilton in 1792 justified hope that more statues and inscriptions might be found here. No attempt at further excavations has, however, been made. In 1885 the site was surveyed, but no new knowledge obtained, beyond the picking up of two fragments bearing a few letters of the Fasti Gabini, or lists of Roman public officials. Many ruined tombs and other Roman structures exist in the neighbourhood, and it is noteworthy that the tombs differ from those nearer Rome in having a square plan. As Gabii was used as a quarry during the Roman Empire, most traces of it have been destroyed. Much harm has been done in modern times, the mosaic floor of the Temple of Juno (Virgil vii. 176), which was in reasonably good condition forty years since, having been entirely destroyed.

Hadrian's Villa at Tivoli.—The writings of earlier students, such as Ligorio, Piranesi, or Canina, are still valuable, though superseded by the more accurate work of modern scholars. Reconstructions, based by Daumet in 1860 upon careful exploration and measurements, were continued by Girault in 1885 and by Esquié in 1887. Their attention was directed to the so-called Piazza d'Oro and the neighbouring buildings. In 1892 similar investigations were made by Winnefeld, and his results published in 1895 as *Ergänzungsheft III. zum Jahrbuch des kaiserlich-deutschen Archeologischen Instituts.* This is the most useful book on the subject as a whole. From 1873 the excavations were conducted by the Government. First the "Poikile," the "Room of the Seven Wise Men," and the "Natatorium" were explored, and in the summer of 1880 these excavations were joined to those of the "Library," "Piazza d'Oro," &c., to the left of the "Vale of Tempe" (see *Notizie degli scavi*, 1880, p. 479). In 1884 the "Poikile" was further explored, but after that no work was done, except in preserving the ruins. Many rooms, corridors, porticos, courts, and nymphaia were cleared; their floors, as a rule, were of mosaic laid in simple patterns, and in fairly good preservation. Most of the marble or stucco mural decoration was found to have been destroyed, though in several cases the original designs were still perceptible. Unfortunately, most of the architectural fragments were removed from the rooms in which they were found, and stored in odd corners in such way as to impede study. Considering the extent of ground excavated, comparatively few works of art were found, the most important being a nearly finished marble copy of a life-size Greek bronze, representing the youthful Dionysos (see *Notizie degli scavi*, 1881, p. 195), which was placed in the Museo delle Terme. The original bronze was probably the work of some disciple of Polykleitos.

Nemi (see *Notizie degli scavi*, 1885, 1887, 1888, 1895, 1896).—Two main objects governed the work at the Lake of Nemi, called by the ancients *Speculum Dianæ*: (1) to clear the ground formerly occupied by the temple and *temenos* sacred to Diana; (2) to determine the exact character of the ancient boats visible at the bottom of the lake near the temple. The work, which in view of its importance should have been done by trained archæologists under Government supervision, was carried out partly by the British ambassador to the Quirinal (Sir John Savile Lumley, now Lord Savile), partly by an antiquity dealer, and only in small measure by the Government. The result was unsatisfactory: most of the objects excavated were sold, and much needless damage was done to the boats. During 1885 parts of the ancient paved road leading to the temple from the surrounding hillside were laid bare, the *favissæ* of the temple found, and a portico to the rear of the temple partially cleared. Architectural fragments, some of gilded bronze; some sculpture; thousands of statuettes, mostly in terra-cotta, but many in bronze; and several hundred coins, from *aes rude* to imperial currency, were unearthed in 1885, and an astonishing quantity of similar objects were found in 1886, 1887, and 1888. In 1895 an antiquity dealer obtained from the Government permission to work on the sunken boats, the existence of which had been known for some centuries. Leon Battista Alberti had tried to raise them; in 1827 some fragments had been raised to the surface; but in 1895 the smallest of them, which measured 60 by 18 metres, was wrenched to pieces by divers, whose methods were both reckless and ignorant. After the damage had been done, a survey by Government engineers showed the possibility of raising the boats; but no attempt was made to raise the larger vessel, still intact. The boat demolished by the divers seems to have been a sort of floating palace moored by ropes to the shore. The floors were of glass mosaic, the windows were closed by bronze gratings, and the beams fastened together by splendid bronze nails often more than a foot long. The hawsers by which the boat was moored ran through bronze rings held in the mouths of colossal wolves' and lions' heads. These heads projected from massive bronze bands or frames, which were originally attached to stakes or pillars. A Medusa head of similar character, but without the ring for the hawser, and a forearm and hand (doubtless used, as in other cases, as a charm on the bow of the ship) were also found. Considered artistically, these works show great vigour, and the over-dramatic treatment of the hair and facial expression characteristic of periods when sculpture is used chiefly for decorative ends. From inscriptions found in 1895 it appears certain that these boats were built by Caligula, who also built the fantastic ships in which he coasted along the shores of Campania (see Suetonius, *Caligola*, 37).

Lake Regillus (see Ashby in the *Rendiconti della Reale Accademia dei Lincei*, February 1898).—Nibby's suggestion (*Analisi della Carta dei dintorni di Roma*, iii. 9), that Pantano Secco is the site of Lake Regillus, is probably correct.

Terracina.—A *nymphæum*, subsequently used as a tomb, was discovered in 1891 during the excavation of the foundations of the railway station of Terracina, which stands on the site of the ancient city of the same name. Fragments of statues of Venus, a nymph, and an unknown male figure were also found, together with some architectural remains. In another part of the town were discovered a sarcophagus and a copy of the marble Faun of Praxiteles. During 1894 more important discoveries were made in connexion with the Temple of Jupiter Anxur, where Jupiter was worshipped as a child (see Livy xxviii. 11, xl. 45; Virgil, *Æn.* vii. 799; and Servius, *ad Æn.* vii. 799). The ruins are situated on a hill called Monte Sant' Angelo. The dimensions of the foundation walls, of which the orientation is north and south, are 33·50 by 19·70 metres. The cella measured 14·10 by 13·60 metres. The walls were decorated with engaged half-columns, six on each side and four at each end. All the walls and the upper parts of the columns were of *opus incertum*, but the lower parts of the columns were of travertine. The *pronaos*, 12·80 metres long, was decorated with Corinthian columns of early imperial style made of a local stone. The temple was destroyed by fire, but also bears traces of having been razed by the hand of man. In front of the temple cisterns were found, and on the east side a curious cleft in the rock, intended perhaps for the taking of the oracle. Some metres below the temple ran a great arcade of *opus incertum*, for the distance of 62 metres towards the south and 24 metres towards the west—a structure traditionally known as the Castle of Theodoric, but shown by the excavations to be the retaining wall of the terrace on which the temple stood. Many curious leaden objects (now in the Museo delle Terme) were found in the *favissæ* situated on the east side of the temple. They represent plates, dishes for cooking fish, tables, chairs, dolls, pitchers, and candelabrum—toys dedicated to the baby Jupiter. A few small fragments of the sculpture which once adorned the temple were also found.

Veii.—Little more is known of this site than in the days of Nibby and Gell. In 1889 (see *Notizie degli scavi*, 1889) Italian officials did some unimportant work at the expense of the Empress of Brazil. Some traces of buildings were found, and large numbers of tombs were opened. They contained objects of an early date (*circa* 6th century B.C.), some of Eastern character suggesting Phœnician trade, but of little importance. Objects of precious metal were few and small. Much bucchero ware came to light, with some aretine cups and several thousand votive offerings in terra-cotta. These latter represented various human organs, but were of coarse make and similar to those discovered on many other sites.

Rome, a city of Georgia, U.S.A., the capital of Floyd county. It is situated in 34° 16′ N., 85° 10′ W., on a plain in the angle of junction of the Etowah and Oostanaula rivers, which here form the Coosa, navigable to this point, in the north-western part of the state, at an altitude of 652 feet. The town is divided into five wards, and has a good water-supply and sewerage system. It has three railways, the Chattanooga, Rome, and Southern, the Southern, and the Western and Atlantic. It is in a fertile cotton region, has cotton compresses and a large trade in that staple, and is the seat of Shorter College, a Baptist institution for women, opened in 1877, which had in 1899 a faculty of 14 and was attended by 129 students. Population (1890), 6957; (1900), 7291, of whom 108 were foreign-born and 2830 negroes.

Rome, a city of Oneida county, New York, U.S.A. It is situated in 43° 13′ N., 75° 27′ W., on the Mohawk river, on the Erie Canal, and on the New York Central and Hudson River and the New York, Ontario, and Western railways, in the central part of the State, at an altitude of 445 feet. The city derives its water-supply from the Mohawk, and is well drained and lighted, but few of its streets are paved. Rome is in the dairying region of central New York, and contains butter and cheese factories. It has varied manufactures of iron, brass, and copper goods, breweries, and locomotive works. Population (1890), 14,991; (1900), 15,343, of whom 2527 were foreign-born and 89 negroes.

Romesh Chandra Mitra, SIR (1840–1899), Indian judge, was born in 1840. When the East India Company's charter was renewed in 1853, the old Supreme Courts and Sadr Courts in the presidency towns were changed into High Courts, and Roma Prasad Roy, son of the great reformer Raja Ram Mohan Roy, was the first Indian who was appointed a judge of the new High Court of Calcutta. He did not live, however, to take his seat on the Bench, and was succeeded by Sambhu Nath Pandit, and then by Dwarka Nath Mitra, perhaps the most talented judge that India produced in the 19th century. Dwarka Nath's great ability and thorough insight into cases were universally recognized in India; his decisions were valued and often quoted; and his name was often mentioned as an illustration of the judicial capacity of the natives of India. Anukul Chandra Mukerji also sat on the Bench for a time; and on his death in 1871, Romesh Chandra Mitra was appointed judge in his place. He maintained the high reputation of his predecessors, and for a period of nearly twenty years, down to 1890, he performed his judicial duties with credit and distinction. When the post of Chief-Justice was temporarily vacant in 1882, the Marquis of Ripon, then Viceroy of India, appointed Romesh Chandra to officiate in that post—the highest judicial position in the Indian Empire. Lord Dufferin, who succeeded Lord Ripon as Viceroy of India, appointed Romesh Chandra a member of the Public Service Commission, and in this capacity he did valuable work. Failing health compelled him to retire from the High Court in 1890, and he was then knighted and appointed a member of the Viceroy's Legislative Council. Till he died in 1899, he continued to take interest in all social, educational, and political reforms in India. (R. C. D.)

Romford, a parish, urban district (1894), and market town, Essex, England, in the Romford parliamentary division of the county, about 12 miles east-north-east of London by rail. In 1895 the ancient civil parish was divided into three civil parishes. A new Wesleyan chapel and a public hall have been erected. Population of urban district (1891) (extended area), 10,473; (1901), 13,656.

Romilly-sur-Seine, town and railway station, arrondissement of Nogent-sur-Seine, department of Aube, France, 22 miles in direct line north-west of Troyes, on the Seine. It is an important industrial town, with extensive manufactures of cotton and woollen hosiery, and of the special machinery and appliances required for the industry. The Eastern Railway Company has large workshops here. Population (1896), 7733; (1901), 8991.

Romney, New, municipal borough, Cinque Port, railway station, and parish, Kent, England, in the Southern or Ashford parliamentary division of the county, 22 miles south-south-west of Canterbury, in the alluvial district called Romney Marsh, a rich grazing area of 24,950 acres secured against the sea by an immense embankment under the management of an ancient corporation. It was formerly a busy port, but its harbour was destroyed by the silting up of shingle, and the town is now 1 mile inland. Littlestone-on-Sea is on the sea-front of the borough, with a fine sandy beach, and is growing in popularity as a summer resort. Population of the borough (1881), 1007; (1901), 1327.

Romsey, a municipal borough and market town, in the New Forest parliamentary division of Hampshire, England, 7 miles north-west of Southampton by rail. The town is very ancient, and was called by the Romans "Romana Insula," because it (and its abbey) stood upon an island partly washed by the river Test. The abbey church of SS. Mary and Elfleda, dating from the first half of the 12th century, is cruciform and mainly fine Norman in style, but with an Early English west front. It was partially restored in 1892. The town has tanyards and ironworks, and the Berthon Boat Company has extensive works here. Population of the municipal borough (1881), 4204; (1901), 4365.

Ronconi, Giorgio (1810–1890), Italian baritone vocalist, was born in 1810. He learnt singing from his father Domenico, who had been a celebrated tenor in his time, and made his début in 1831 at Pavia. After singing in Italy for some years with ever-growing success, he appeared for the first time in England, in 1842, as Henry Ashton in *Lucia di Lammermoor*. His success was immediate, and he continued to be one of the most popular artists on the lyric stage until his retirement in 1866. His voice was neither extensive in compass nor fine in quality, but the genius of his acting and the strength of his personality fully atoned for his vocal defects. He was equally at home in comedy and tragedy, and the two parts by which he is best remembered, Rigoletto and Figaro, show conclusively the range of his talent. In his later years Ronconi founded a school of singing at Granada, and he also accepted the post of professor of singing at the Madrid Conservatoire. He died in 1890.

Ronda, a town of Spain, province of Malaga, on the river Guadalaviar. It has a station on the railway line from Algeciras to the junction of Bobadilla, on the Cordova–Granada–Malaga lines. The local industries are chiefly soap, flour, chocolate, tanneries, alcohol, and hat-making. Ronda has four parish churches. The most important public buildings are the town-hall, bull-ring, casino, Casa del Rey Moro, the hospital of Santa Barbara, refuge for aged paupers, eight municipal schools for both sexes, and normal schools. Population (1897), 19,307.

Ronsdorf, a town of Prussia, Rhine province, 4 miles south of Barmen by rail, the seat of iron, steel, and copper industries, ribbon factories, brewing, and distilling. Has monuments to the Emperors William I. and Frederick III. Population (1885), 10,542; (1900), 13,299.

Röntgen, Wilhelm Konrad (1845-——), German physicist, was born at Lennep on 27th March 1845. He received his early education in Holland, and then went to study at Zürich, where he took his doctor's degree in 1869. He then became assistant to Kundt at Würzburg and afterwards at Strasburg, becoming *privat-docent* at the latter university in 1874. Next year he was appointed professor of mathematics and physics at the Agricultural Academy of Hohenheim, and in 1876 he returned to Strasburg as extraordinary professor. In 1879 he was chosen ordinary professor of physics and director of the Physical Institute at Giessen, whence in 1885 he removed in the same capacity to Würzburg. It was at the latter place that he made the discovery for which his name is chiefly known, the Röntgen rays. In 1895, while experimenting with a highly-exhausted vacuum tube on the conduction of electricity through gases, he noticed that a paper screen covered with barium platinocyanide, which happened to be lying near, became fluorescent under the action of some radiation emitted from the tube, which at the time was enclosed in a box of black cardboard. Further investigation showed that this radiation had the power of passing through various substances which are opaque to ordinary light, and also of affecting a photographic plate. Its behaviour being curious in several respects, particularly in regard to reflection and refraction, doubt arose in his mind whether it was to be looked upon as light or not, and he was led to put forward the hypothesis that it was due to longitudinal vibrations in the ether, not to transverse ones like ordinary light; but in view of the uncertainty existing as to its nature, he called it X-rays. For this discovery he received the Rumford medal of the Royal Society in 1896, jointly with Professor Philip Lenard, who had already shown, as also had Hertz, that a portion of the cathode rays could pass through a thin film of a metal such as aluminium. Professor Röntgen has also carried out researches in various other branches of physics, including elasticity, capillarity, the conduction of heat in crystals, the absorption of heat-rays by different gases, piezo-electricity, the electromagnetic rotation of polarized light, &c.

Röntgen Rays. See Electricity.

Roon, Albrecht Theodor Emil, Count von (1803–1879), Prussian field-marshal, author, and reorganizer of the Prussian army, was born at Pleushagen, near Colberg, in Pomerania, on the 30th April 1803. His family was of Flemish origin, and was settled in Pomerania. His father, an officer of the Prussian army during the French occupation, died in poverty, and young von Roon was brought up by his maternal grandmother. He entered the corps of cadets at Kulm in 1816, whence in 1818 he proceeded to the military school at Berlin, and on the 19th January 1821 received a commission in the 3rd (now 14th) Pomeranian regiment quartered at Stargard in Pomerania. In 1824 he went through the three years' higher course of study at the war school in Berlin. In 1826 he was transferred to the 15th Foot at Minden, but the same year was appointed an instructor in the military cadet school at Berlin, where he devoted himself especially to the subject of military geography. He published in 1832 the well-known *Principles of Physical, National, and Political Geography*, in three volumes (*Grundzüge der Erd-Völker-und-Staaten-Kunde*), thereby founding a practically new system and making a name for himself. This work was followed in 1834 by *Elements of Geography* (*Anfangsgründe der Erdkunde*), in 1837 by *Military Geography of Europe* (*Militärische Länderbeschreibung von Europa*), and in 1839 by *The Iberian Peninsula* (*Die Iberische Halbinsel*).

Meantime, in 1832, he rejoined his regiment, and was afterwards attached to the headquarters of General von Müffling's corps of observation at Crefeld, when he first became alive to the very inefficient state of the Prussian army. In 1833 he was appointed to the Topographical Bureau at Berlin, in 1835 he entered the General Staff, and in the following year was promoted captain and became instructor and examiner in the military academy at Berlin. In 1842 he was promoted to be major, and was present at the manœuvres on the Rhine under General von Pfhül, when he was again impressed with the inefficiency of the organization of the army, and occupied himself with schemes for its reform. Two years later, as tutor to Prince Frederick Charles, he attended him at the Bonn University and in his European travels. In 1848 he was appointed chief of the staff of the 8th Army Corps at Coblenz, under the command successively of Generals von Dunker, von Schreckenstein, and von Hirschfeld. During the disturbances of that year he served under the Crown Prince William (afterwards German Emperor) in the suppression of the insurrection at Baden, and distinguished himself by his energy and bravery, receiving the 3rd class of the order of the Red Eagle in recognition of his services. While attached to the Crown Prince's staff at that time he broached to him the subject of his schemes of army reform. In 1849 he was promoted to be lieutenant-colonel and entrusted with the details of the mobilization to take place the following year; but the defective condition of the organization of the army was so serious that the differences with Austria had to be arranged by the humiliating treaty of Olmütz in November 1850.

Promoted to be major-general in 1856 and lieutenant-general in 1859, von Roon had held since 1850 several commands and had been employed on important missions. Prince William became regent in 1857, and in 1859 he appointed von Roon a member of a commission to report on the reorganization of the army. Supported by Manteuffel and von Moltke, von Roon was able to get his plans seriously considered and generally adopted. His aim was to create an armed nation, to extend Scharnhorst's system, and to adapt it to Prussia's altered circumstances. To attain this he proposed a universal three years' service, and a reserve (*Landwehr*) for the defence of the country when the army was actively engaged. During the Italian war he was charged with the mobilization of a division. At the end of 1859 he succeeded von Bonin as War Minister, and two years later the Ministry of Marine was also entrusted to him. His proposals of army reorganization met with the bitterest opposition, and it was not until after long fighting against a hostile majority in the Chambers that, with Bismarck's aid, he

carried the day. Even the Danish campaign of 1864 did not wholly convince the country of the necessity of his measures, and it required the war with Austria of 1866 to convert obstinate opposition into enthusiastic support. Then von Roon, from being the best hated man in Prussia, became the most popular, and his reforms were ultimately copied throughout continental Europe. The system adopted by the North German Confederation produced its inevitable result in the victorious war with France in 1870–71, throughout which von Roon was in attendance on the German Emperor. The fiftieth anniversary of his entrance into the army was celebrated at Versailles on the 19th January 1871, when the Emperor expressed his gratitude for the great services he had rendered. He was created a count, and in December 1871, having resigned the Ministries of War and Marine, he succeeded Bismarck as President of the Prussian Ministry. Ill-health compelled him to resign in the following year. He was promoted to be field-marshal on the 1st January 1873. He died at Berlin on the 23rd February 1879.

After his death his son published the valuable *Denkwürdigkeiten aus dem Leben des Generalfeldmarschalls Kriegsministers Grafen Roon, Sammlung von Briefen, Schriftstücken und Erinnerungen* (2 vols., Breslau, 1892), and *Kriegsminister von Roon als Redner politisch und militärisch erläutert* (Breslau, 1895). (R. H. V.)

Roorkee, or RURKI, a town of British India, in the Saharanpur district of the North-West Provinces; situated in 29° 52′ N. and 77° 55′ E.; on the Oudh and Rohilkhand Railway, 22 miles east of Saharanpur. Population (1891), 14,291; municipal income (1897–98), Rs.13,730. Headquarters of the workshops of the Ganges canal, and also of the Bengal sappers and miners. Thomason Civil Engineering College, founded 1847, was transferred from the Public Works to the Education Department in 1895, and then reorganized. It consists of an engineer class of 22 English and 11 native students, an upper subordinate class of 31 English civil and military and 16 native students, a lower subordinate class of 66 native students, a military survey class of 8 English and 10 native students, together with mechanical apprentice and industrial classes. The college, which is not affiliated to the Allahabad University, works in co-operation with the workshops and foundry of the canal, and also trains in surveying and in photography.

Roosevelt, Theodore (1858– ——), President of the United States, was born in New York City on the 27th October 1858. His ancestry connected him with old and substantial families in both the Northern and the Southern section of the Union. The Roosevelts, his father's forebears, had been, from the middle of the 17th century, conspicuous in the Dutch element of the citizens of New York, and his mother, *née* Bullock, was a member of an old family which furnished the first revolutionary governor to the state of Georgia. The education of Theodore Roosevelt was that common to the well-to-do boys of his time, and culminated in the course at Harvard College, from which he graduated in 1880. After a period of travel in Europe, he returned to New York in 1881, and studied for a year in the law school of Columbia College and in the office of his uncle. The law proved, however, to have little attraction for him, and the year during which he was nominally engaged in its study saw the beginning of his active career in the two lines which were most to his taste—literature and politics. It was at this same time, moreover, that he began his familiar acquaintance with Western frontier life, and added another and most significant element to those hereditary interests which attached him in sympathy to widely diverse sections of the country.

Mr Roosevelt entered political life as a Republican, but in opposition to the "machine." As the nominee of a body of independents in the party, he was elected member of the state legislature from New York City in the autumn of 1881, and served continuously for three years, 1882–84. During this period his energy, honesty, and fearlessness won for him a very prominent position in his party and in general public esteem. He devoted himself especially to the cause of administrative reform in New York City, and pursued to extinction a number of grave abuses in the government of the municipality. In 1884, as a delegate to the National Convention of the Republican party, he joined with the faction which opposed the nomination of Mr Blaine for President; and while he did not, like many of his associates in that cause, refuse to accept Mr Blaine when nominated, his support of the candidate lacked something of his familiar vehemence, though he strenuously proclaimed himself a loyal party man. Two years later he justified his professions of party loyalty by accepting the Republican nomination for mayor of New York City, at a time when most of the reform element in the party wished to unite in a non-partisan movement against Tammany Hall. His conduct at this time brought upon him censure from many who had hitherto warmly supported him, and he was badly defeated in the election. For three years after this Mr Roosevelt devoted himself chiefly to literature and to the enjoyment of life on his ranche in the mountains of Dakota. In April of 1889, at the beginning of Mr Harrison's administration, the President appointed Mr Roosevelt a member of the National Civil Service Commission, on which he served for six years. In this position he found congenial occupation in promoting with all his energy the substitution of competitive examination for congressional patronage in filling the minor administrative offices. He retired from this position only when the scheme had been worked out through which, by President Cleveland's order, practically the whole civil service was brought under the operation of the new system. From this work of reform Mr Roosevelt was called back to municipal affairs in 1895, through his appointment as one of the police commissioners of New York City. A legislative investigation had revealed widespread and inveterate corruption in the police force, and Mr Roosevelt found a field for all his energy in restoring in some measure the *moral* of the organization. The two years of service in this work confirmed his reputation for great administrative efficiency, and general approbation was given to his appointment by President McKinley as Assistant Secretary of the Navy in 1897. In this position it fell to Mr Roosevelt to contribute very greatly to the preparation of the navy for the war with Spain. Himself anticipating and convinced of the justice of the war, he saw to it that the vessels and supplies were so distributed, both at home and in the Orient, that when hostilities broke out the victories in the waters of Cuba and the Philippines followed as matters of course. Dissatisfied with a function that kept him from participation in the actual fighting, Mr Roosevelt resigned from the Navy Department 6th May 1898, and devoted himself to the organization of a volunteer regiment of cavalry—popularly known as the "Rough Riders"—of which he was commissioned lieutenant-colonel. His reputation and extensive acquaintance throughout the country brought together in this regiment a remarkable assortment of typical characters, from the fashionable clubs and the police force of New York, football players and all-round athletes from the prominent colleges, and cowboys and other venturesome spirits from the West. With this command, which was quickly drilled into a well-disciplined and formidable body of troops, he took part in the campaign

which resulted in the fall of Santiago. For conspicuous gallantry in action Mr Roosevelt was promoted to be colonel. After the surrender of the Spaniards he quickly became weary of the idle waiting, in the hot and fever-stricken region, for the return to America, and his vigorous and reasonable, if somewhat insubordinate, representations to the commander-in-chief greatly hastened the withdrawal of the troops to the United States, where the regiment was mustered out of service at the end of the summer.

With the addition of conspicuous military achievement to his record for strength and efficiency in civil office, Mr Roosevelt's political career was now assured. Nominated on his return from Cuba as the Republican candidate for governor of New York State, he was elected by a substantial majority in November 1898. His administration was characterized by the same devotion to honest and straightforward party politics and to pure and efficient administrative methods that had been manifest in his earlier career. When the presidential elections of 1900 drew near, there was evidently a strong feeling in the rank and file of the Republican party that Governor Roosevelt should receive national office. Since many circumstances conspired to make the renomination of Mr McKinley as President inevitable, the demand arose that Governor Roosevelt should be named for Vice-President. The relatively insignificant duties of this office, however great its dignity, offered no attraction to so active a spirit as that of Mr Roosevelt, and he was, moreover, anxious to serve another term as governor. Hence he resisted openly and with all his power the movement to name him for Vice-President. But the popular enthusiasm was sedulously stimulated by the New York politicians of the baser sort, who were very willing to get rid of a governor who had little sympathy with their general aims and methods, and the National Republican Convention, disregarding the persistent refusals of Mr Roosevelt, put him by main force in nomination as Vice-President. The elections of 1900 gave an easy victory for McKinley and Roosevelt. Inaugurated in March 1901, the Vice-President's only service was a nominal presidency of the Senate in the special session in March. The assassination of Mr McKinley brought the succession to Mr Roosevelt, who took the oath and assumed the functions of President on the day of Mr McKinley's death, 14th September 1901.

PRESIDENT ROOSEVELT.

Mr Roosevelt's contributions to literature have had a pretty close relation to the events of his active life. His first work, *The Naval History of the War of 1812*, was published in 1882, at the outset of his career. Between 1885 and 1889, when not in the public service, he entered upon that systematic study of frontier life which produced not only his chief historical work, *The Winning of the West*, but also a series of volumes descriptive of his experiences in hunting and ranching in the Far West. His experiences in political life resulted in a number of volumes and very many magazine articles in all of which the leading feature was the gospel of activity and effort—the "strenuous life," as opposed to either the aloofness of the mere philosopher and critic, or the indolence and idleness of the Sybarite or the cynic. Some of these articles were published in 1902 under the title of *The Strenuous Life*.

Rops, Félicien (1833–1898), Belgian painter, designer, and engraver, excelled in these three methods of artistic expression; but his engraved work is the most important, both as to mastery of technique and originality of ideas, though in all his talent was exceedingly versatile. Hardly any artist of the 19th century equalled him in the use of the dry-point and soft varnish. By his assured handling and admirable draughtsmanship, as well as the variety of his sometimes wildly fantastic conceptions, he made his place among the great artists of his time. "Giving his figures a character of grace which never lapses into limpness," says his biographer, E. Ramiro, "he has analysed and perpetuated the human form in all the elegance and development impressed on it by modern civilization." Félicien Rops (born at Namur, in Belgium, 10th July 1833) spent his childhood in that town, and afterwards in Brussels, where he composed in 1856, for his friends at the university, the *Almanach Crocodilien*,

his first piece of work. He also brought out two *Salons Illustrés*, and collaborated on the *Crocodile*, a magazine produced by the students. The humour shown in his contributions attracted the attention of publishers, who offered him work. From 1864 to 1866 he designed, among other things, almost all the frontispieces for Poulet-Malassis, and afterwards for Gay and Doucé. In 1865 he started a satirical journal: *Uylenspilgel*, a sort of *Charivari*. The issue, limited unfortunately to two years, included his finest lithographs. In the same year he brought out his famous "Buveuse d'Absinthe," which placed him in the foremost rank of Belgian engravers; and in 1871 the "Dame au Pantin." After 1874 Rops resided in Paris. His talent, which commanded attention by its novel methods of expression, and had been stimulated by travels in Hungary, Holland, and Norway, whence he brought back characteristic sketches, now took a soaring flight. To say nothing of the six hundred original engravings enumerated in Ramiro's *Catalogue of Rops' Engraved Work* (Paris, Conquet, 1887), and one hundred and eighty from lithographs (Ramiro's *Catalogue of Rops' Lithographs*, Paris, Conquet, 1891), besides a large number of oil-paintings in the manner of Courbet, and of pencil or pen-and-ink drawings, he executed several very remarkable water-colour pictures, among which are "Le Scandale," 1876; "Une Attrapade," 1877 (now in the Brussels Museum); a "Tentation de St Antoine," 1878; and "Pornocrates," 1878. Most of these have been engraved and printed in colours by Bertrand. From 1880 to 1890 he devoted himself principally to illustrating books: *Les Rimes de Joie*, by Théo Hannon; *Le Vice Suprême* and *Curieuse*, by J. Péladan; and *Les Diaboliques*, by Barbey d'Aurévilly; *L'Amante du Christ*, by R. Darzens; and *Zadig*, by Voltaire; and the poems of Stéphane Mallarmé have frontispieces due to his fertile and powerful imagination. Before this he had illustrated the *Légendes Flamandes*, by Ch. Decoster; *Jeune France*, by Th. Gautier; and brought out a volume of *Cent Croquis pour rejouir les Honnêtes Gens*. His last piece of work, an advertisement of an exhibition, was done in November 1896. Rops died, 23rd August 1898, at Essonnes, Seine-et-Oise, on the estate he had purchased, where he lived in complete retirement with his family. Scorning display, Rops almost always opposed any exhibition of his works. However, he consented to join the Art Society of the "XX.," formed at Brussels in 1884, as their revolutionary views were in harmony with the independence of his spirit. After his death, in 1899, the Libre Esthétique, which in 1894 had succeeded the "XX.," arranged a retrospective exhibition, which included about fifty paintings and drawings by Rops. Rops was a Chevalier of the Legion of Honour.

In 1896 *La Plume* (Paris) devoted a special number to this artist, fully illustrated, by which the public were made aware how many of his works are unsuitable for display in the drawing-room or boudoir. E. Deman, the publisher at Brussels, brought out a volume in 1897 with the title, *Félicien Rops et son œuvre*—papers by various writers. We may also mention a study of *Félicien Rops*, by Eugène Demolder (Paris, Princebourde, 1894), and another by the same writer in *Trois Contemporains* (E. Deman, 1901); *Les Ropsiaques*, by Pierre Gaume, brought out in London, 1898; and the admirable notice by T. K. Huysmans in his volume called *Certains*. (O. M*.)

Rosario, a city and important river port of the Argentine Republic, in the province of Santa Fé, on the river Paraná, in 32° 56′ S. and 60° 33′ 39″ W. Population in 1900, 112,461, an increase of 23 per cent. as compared with the census of 1895. Railways following seven distinct routes afford communication with the other cities of the republic, and within Rosario itself various tramways are laid down. There are a municipal zoological garden, several parks and recreation grounds, and monuments in honour of Garibaldi and the "25th of May," (Revolution Day, 1810). A public hospital has been erected; there are also Italian and Anglo-German hospitals. Public buildings also include a handsome Palais de Justice, a normal school for teachers, a school for secondary education, and a theatre. The exports consist chiefly of cereals and other agricultural produce from the busy settlements that have been established in the district. In 1900 the grain exported from Rosario was 809,000 tons of wheat, 202,000 tons of maize, and 64,000 tons of linseed. The railways carry much of the trade, but besides the river and coast traffic, steamers maintain direct communication with Europe. In 1880 the imports were valued at £1,130,000, and the exports at £1,230,000; in 1890 at £3,120,000 and £3,280,000; in 1898 at £1,840,000 and £5,160,000; in 1899 at £2,027,442 and £7,350,121; and in 1900 at £1,913,803 and £5,851,239. In 1890, 1039 vessels of 742,967 tons entered, and 913 of 654,623 tons cleared; in 1898, 664 vessels of 696,550 tons entered, and 831 of 922,000 tons cleared. In 1900, 682 ocean-going vessels of 1,027,353 tons entered the port, and approximately the same number cleared.

Roscher, Wilhelm Georg Friedrich (1817–1894), German political economist, was born at Hanover, 21st October 1817. He studied at Göttingen and Berlin, and obtained a professorship at Göttingen in 1844 and subsequently at Leipzig in 1848. He is one of the most important in what is known as the "historical" school of political economy. He published a number of works on this and kindred subjects, the two chief being his great *System der Volkswirthschaft*, published in 5 vols. between 1854 and 1894, and his *Geschichte der Nationalökonomie in Deutschland* (1874). He also published in 1842 an excellent commentary on the life and works of Thucydides. He died at Leipzig, 4th June 1894.

Roscommon, an inland county of Ireland, province of Connaught. The area of the administrative county in 1900 was 607,002 acres, of which 120,406 were tillage, 358,090 pasture, 69 fallow, 7444 plantation, 75,431 turf bog, 9875 marsh, 6213 barren mountain, 29,474 water, roads, fences, &c. The administrative county under the Local Government (Ireland) Act, 1898, includes one electoral division formerly situated in Galway, and two electoral divisions formerly situated in Mayo, but does not include the portions of the towns of Ballinasloe and Athlone formerly in Roscommon.

Population.—The population in 1881 was 132,490; in 1891, 114,397; and in 1901, 101,639, of whom 51,143 were males and 50,496 females, divided as follows among the different religions: Roman Catholics, 98,985; Protestant Episcopalians, 2229; Presbyterians, 247; Methodists, 96; and other denominations, 82. The decrease of population between 1881 and 1891 was 13·65 per cent., and between 1891 and 1901, 12·8 per cent. The average number of persons to an acre in 1891 was ·19, and of the total population, 107,201 inhabited the rural districts, being an average of 147 to each square mile under crops and pasture. The following table gives the degree of education in 1891:—

	Males.	Females.	Total.	Percentage.			
				R. C.	Pr. Ep.	Presb.	Meth.
Read and write	37,546	34,702	72,248	69·2	92·3	95·9	95·8
Read only	5,579	6,450	12,029	12·0	4·0	2·7	1·7
Illiterate	9,186	9,621	18,807	18·8	3·7	1·4	2·5

The percentage of illiterates among Roman Catholics in 1881 was 28·2. In 1891 there were 5 superior schools, with 237 pupils (Roman Catholics 49, and Protestants 188), and 236 primary schools, with 17,714 pupils (Roman Catholics 17,211, and

Protestants 503). The number of pupils on the rolls of the National schools on 31st December 1900 was 20,707, of whom 20,241 were Roman Catholics and 466 Protestants. The following table gives the number of births, deaths, and marriages in various years:—

	Births.	Deaths.	Marriages.
1881 . .	3615	2001	593
1891 . .	2383	1717	388
1900 . .	1921	1536	404

In 1900 the birth-rate per 1000 was 18·9, and the death-rate 15·1; the rate of illegitimacy was ·7 per cent. of the total births. The total number of emigrants who left the county between 1st May 1851 and 31st December 1900 was 102,273, of whom 50,328 were males and 51,945 females. The chief towns in the county are Boyle, Castlerea, and Roscommon.

Administration.—The county is divided into two parliamentary divisions, North and South, the number of registered electors in 1901 being respectively 8871 and 9610. The rateable value in 1900 was £300,187. By the Local Government (Ireland) Act, 1898, the fiscal and administrative duties of the grand jury were transferred to a county council, urban and rural district councils were established, and under that Act the county now comprises seven rural sanitary districts.

Agriculture.—The following tables give the acreage under crops, including meadow and clover, and the amount of live stock in 1881, 1891, 1895, and 1900. The figures for 1900 are for the new administrative county:—

	Wheat.	Oats.	Barley, Rye.	Potatoes.	Turnips.	Other Green Crops.	Meadow and Clover.	Total.
1881	452	28,329	803	28,901	4543	2369	68,367	133,564
1891	455	21,815	2168	23,547	4820	3220	68,227	124,252
1895	172	19,528	1075	20,609	4186	3577	72,487	121,335
1900	409	17,603	1425	20,764	3939	3833	72,425	120,406

For 1900 the total value of the cereal and other crops was estimated at £771,870. The number of acres under pasture in 1881 was 335,118; in 1891, 344,186; and in 1900, 358,090.

	Horses and Mules.	Asses.	Cattle.	Sheep.	Pigs.	Goats.	Poultry.
1881 .	10,552	8,514	103,759	138,067	28,181	10,646	466,075
1891 .	12,733	10,639	124,502	196,305	37,059	15,787	500,083
1395 .	13,421	10,916	121,644	171,165	37,939	14,279	535,498
1900 .	12,247	11,844	134,528	192,459	42,774	14,358	595,507

The number of milch cows in 1891 was 31,128, and in 1900, 34,635. It is estimated that the total value of cattle, sheep, and pigs for 1900 was £2,146,410. In 1900 the number of holdings not exceeding 1 acre was 925; between 1 and 5, 2256; between 5 and 15, 8718; between 15 and 30, 5796; between 30 and 50, 1750; between 50 and 100, 924; between 100 and 200, 539; between 200 and 500, 282; and above 500, 21; total, 21,211. The number of loans issued (the total of loans being the same as that of tenants) under the Land Purchase Acts, 1885, 1891, and 1896, up to 31st March 1901, was 1811, amounting to £347,437. The number of loans for agricultural improvements sanctioned under sect. 31 of the Land Act, 1881, between 1882 and 1901, was 575, and the amount issued was £38,029. The total amount issued on loan for all classes of works under the Land Improvement Acts, from the commencement of operations in 1847 to 31st March 1901, was £232,683.

(W. H. Po.)

Rosebery, Archibald Philip Primrose, 5th Earl of (1847–——), British statesman, born in London on 7th May 1847, was the grandson and successor to the title of Archibald John Primrose, 4th earl of Rosebery (*d.* 1868), a representative peer of Scotland, who was in 1828 created a peer of the United Kingdom as Baron Rosebery, and was an active supporter of the Reform Bill. The Scottish earldom was first conferred in 1700 upon the 4th earl's great-grandfather, Archibald Primrose of Dalmeny (1661–1723), a staunch Whig and commissioner for the Union. The 5th earl's mother was Catherine Lucy Wilhelmina, only daugher of Philip Henry, 4th Earl Stanhope; she was thus a sister of Earl Stanhope the historian, and a niece of Lady Hester Stanhope, who was the niece of William Pitt. A celebrated beauty, a maid of honour and bridesmaid of Queen Victoria, she married, on 20th December 1843, Archibald Lord Dalmeny (1809–1851), member for the Stirling Burghs, who became a lord of the Admiralty under Melbourne. After his death she became the wife of Harry George Vane, 4th duke of Cleveland, and died in 1901.

The young Lord Dalmeny was educated at Brighton and at Eton, where he had as slightly junior contemporaries Mr A. J. Balfour and Lord Randolph Churchill. He was described by the most brilliant Eton tutor of his day, William Johnson Cory (author of *Ionica*), as a "portentously wise youth, not, however, deficient in fun." He added that Dalmeny "desired the palm without the dust." In 1866 he matriculated at Christ Church, Oxford, but went down in 1868, by the request of the dean, rather than abandon the possession of a small racing stud. In the same year he succeeded to the earldom and to the family estates. In February 1871 he seconded the Address in the House of Lords; a more original effort followed in November 1871, when he delivered a remarkable essay on the Union of Scotland and England at the Edinburgh Philosophical Institution. Three years later he was elected president of the Social Science Congress at Glasgow, where, on 30th September, he gave a striking address upon the discovery of means for raising the condition of the working class as the "true leverage of empire." In the meantime he travelled in the south of Europe and in North America. On his return he acquired an English country house called The Durdans, Epsom, which he largely rebuilt and adorned with some of the finest turf portraits of George Stubbs. Following the example, as he declared, of Oliver Cromwell (for whom he showed an admiration in other respects—culminating in 1900 in the erection of a statue outside Westminster Hall, which was not appreciated either by the Irish Nationalist party or by others among his political associates), he took a pride in owning racehorses, and afterwards twice won the Derby, in 1894 and 1895. No former premier had attained to the distinction of being Derby-winner during office; but though the distinction was popular among many classes, it did not endear Lord Rosebery to the Nonconformists, who considered a racehorse a mere gambling-machine. On 20th March 1878 he married Hannah, only child of Baron Meyer Amschel de Rothschild, of Mentmore, Bucks. The newly married couple took a lease of Lansdowne House, which for several years was a salon for the Liberal party and a centre of hospitality for a much wider circle.

Though impeded in his political career by his exclusion from the House of Commons, Lord Rosebery's reputation as a social reformer and orator was steadily growing during these years. In 1878 he was elected Lord Rector of Aberdeen and in 1880 of Edinburgh University, where he gave an eloquent address upon Patriotism. In 1880 he entertained Mr Gladstone at Dalmeny, and during the "Midlothian campaign" he had much to do with the stage-management of the demonstrations. It is possible that their success may have led him to form a somewhat unduly histrionic conception of the part of a political leader, and this tendency was not weakened by an enthusiastic study of Lord Beaconsfield's political novels, more particularly of *Sybil*, after the heroine in which he named one of his daughters. In August 1881 he became under-secretary at the Home Office, his immediate chief being Sir William Harcourt. His

work was practically confined to the direction of the Scottish department of the Office. A clamour was nevertheless raised in regard to the incompatibility of the under-secretaryship with a position in the House of Lords, and Lord Rosebery resigned the post in June 1883. He and his wife utilized the interval to make a trip round the world, being most warmly received in Australia, and returning by way of India. At the close of 1884 he resumed office as first commissioner of works with a seat in the cabinet, and his adherence carried with it a distinct accession of strength to the Liberal ministry, which was much discredited by the tragedy attached to the fate of Gordon. The attitude of the Government on the Afghan question and generally in regard to Russia was held by many to have been perceptibly stiffened owing to Lord Rosebery's influence.

In June 1885 the Liberal administration broke up, but Lord Salisbury's ministry, which succeeded, was beaten early in February 1886, and when Mr Gladstone adopted Home Rule, Lord Rosebery threw in his lot with the old leader, and was made secretary of state for foreign affairs during the brief Liberal ministry which followed. He rather distinguished himself in the Lucia Bay negotiations then being carried on with Germany. If Busch is to be believed, Prince Bismarck's view was that Lord Rosebery had "quite mesmerized" Count Herbert Bismarck, and the latter, from his father's standpoint, conceded too much to Lord Rosebery, who proved himself to be, in Bismarck's language, "very sharp." His views on foreign policy differed materially from those of Granville and Gladstone. His mind was dwelling constantly upon the political legacy of the two Pitts; he was a reader of Sir John Seeley; he had himself visited the colonies; had predicted that a war would not, as was commonly said, disintegrate the Empire, but rather the reverse; had magnified the importance of taking colonial opinion; and had always been a convinced advocate of some form of Imperial Federation. He was already taunted with being an Imperialist, but his independent attitude won public approval. Cambridge gave him the degree of LL.D. in 1888; in January 1889 he was elected a member of the first County Council of London, and on 12th February he was elected chairman of that body by 104 votes to 17. The tact, assiduity, and dignity with which he guided the deliberations of the council made him exceedingly popular with its members. In the spring of 1890 he presided over the Co-operative Congress, but with a view to the impending political campaign he found it necessary to resign the chairmanship of the County Council in June. In November of this year, however, Lady Rosebery died, and he withdrew for a period from public business. In 1891 he made some brief Continental visits, one to Madrid, and in October he saw through the press his little monograph upon *William Pitt*, in the "Twelve English Statesmen" series, of which it may be said that it competes in interest with Mr John Morley's *Walpole*. In January 1892, upon a new election, he again for a few months became chairman of the County Council. It was already recognized that in him the country possessed not only a public man of exceptionally attractive personality, but one whose literary tastes were combined with a gift for expression which was at once original and fluent. In October the Garter was conferred upon him by Queen Victoria.

THE EARL OF ROSEBERY.
(*From a photograph by Elliott and Fry, London.*)

Meanwhile, in August, upon the return of Gladstone to power, he was induced with some difficulty (for he was suffering at the time from insomnia) to resume his position as Foreign Minister. His acceptance was construed as a security against the suspicion of weakness abroad which the Liberal party had incurred by their foreign policy during the 'eighties. He strongly opposed the evacuation of Egypt; he insisted upon the exclusive control by Great Britain of the Upper Nile valley, and also upon the retention of Uganda. In 1893 the question of Siam came near to causing serious trouble with France, but by the exercise of a combination of firmness and forbearance on Lord Rosebery's part the crisis was averted, and the lines were laid down for preserving Siam, if possible, as a buffer state between the English and French frontiers in Indo-China. In the spring of 1895 he was clear-sighted enough to refuse to join the anti-Japanese League of Russia, France, and Germany at the end of the China-Japan war.

Lord Rosebery's personal popularity had been increased at home by his successful intervention in the coal strike of December 1893, and when in March 1894 the resignation of Gladstone was announced, his selection by Queen Victoria for the premiership was welcomed by the public at large and by the majority of his own party. On all hands he was then considered *dignus imperio*—it was only as the new administration went to pieces that people began to add *nisi imperasset*. The conditions he had to face were by no means hopeful. The Liberal majority of 44 was already dwindling away, and the malcontents, who considered that Sir William Harcourt should have been the prime minister, or who were perpetually intriguing against a leader who did not satisfy their idea of Radicalism, made Lord Rosebery's personal position no easy one. A systematic policy of detraction was pursued by the small section of the Radical party who objected to a peer premier as such, and a great deal of adverse criticism was also aroused by a speech in which the prime minister, taunted for not again bringing forward a Home Rule measure, insisted upon the truism that the conversion of England, the "predominant partner," was a necessary condition of success. The support of the Irish Nationalists was by no means secure. Lord Rosebery's foreign policy, moreover, was too Tory for his Radical followers; he insisted upon "continuity of policy in foreign affairs," which

meant carrying on the Conservative policy and not upsetting it. The premier was thought to have shown a restlessness and a rawness at the touch of censure, which did not increase his reputation for reserve power or strength, but this was undoubtedly due in large measure to the recrudescence of the insomnia from which he had suffered in 1891. The Government effected little. In Mr Asquith's phrase, it was "ploughing the sands." The Parish Councils Act was only passed by compromising with the Opposition. Local Veto and Disestablishment of the Welsh Church were put in the forefront of the party programme, but the Government was already to all appearances riding for a fall, when on 24th June 1895 it was beaten upon an adverse vote in the Commons in regard to a question of the supply and reserve of small arms ammunition.

The general election which followed after Lord Salisbury had formed his new ministry was remarkable for the undisciplined state of the Liberal party. At the Eighty Club and the Albert Hall, Lord Rosebery advised them to concentrate upon the reform of the House of Lords, that assembly being, as he said, a foremost obstacle to the passing of legislation on the lines of the Newcastle programme, but he was unable to suggest in what direction it should be reformed. Sir William Harcourt and Mr John Morley, on the other hand, concentrated respectively upon Local Option and Home Rule. The result was an overwhelming defeat. Lord Rosebery handed over the seals of office with undisguised relief. Considerable difficulties in Africa, in Chitral, and in the Levant were transmitted to the new Government. The question of intervention between the Sultan and the Armenians became a burning one in the country in 1896, and Mr Gladstone emerged from his retirement to advocate intervention. Lord Rosebery declined to support this demand at the risk of a European war, and on 8th October 1896 he announced to the Liberal whip, Mr Thomas Ellis, his resignation of the Liberal leadership. On the following day he made a farewell speech at the Empire Theatre, Edinburgh, to over 4000 people, and for some time he held aloof from party politics, "ploughing his furrow alone," as he afterwards phrased it.

In 1898, on the death of Mr Gladstone, he paid a noble and eloquent tribute in the House of Lords to the life and public services of his old leader. He was a pall-bearer at his funeral on 28th May, as he had previously been at the burials of Tennyson and Millais. His influence in the country was still a strong one on personal grounds, and he came forward now and again to give expression independently to popular feeling. In the autumn of 1898 he gave valuable support to the attitude taken up by Lord Salisbury upon the Fashoda question. He was indeed bound by consistency to withstand what his own Government, by the words of Sir Edward Grey, had declared would be an unfriendly act on the part of France. Again, after Mr Kruger's ultimatum in October 1899, Lord Rosebery spoke upon the necessity of the nation closing its ranks and supporting the Government in the prosecution of war in South Africa. After Nicholson's Nek he reiterated the resolution of the country "to see this thing through." Nevertheless, in a letter to Captain Lambton, an unsuccessful Liberal candidate for Newcastle, in September 1900, he condemned the general conduct of affairs by Lord Salisbury's Government, while in several speeches in the House of Lords he strongly urged the necessity of army reform. Since his abandonment of the leadership in 1896, the lack of coherence in the Liberal party had become more and more manifest. The war had brought to the front a pro-Boer section, who seemed gradually to be compromising the whole party, and had apparently succeeded in winning the support of Sir Henry Campbell-Bannerman, the leader in the House of Commons. Lord Rosebery maintained for the most part a Sphinx-like seclusion, but in July 1901 he at last came forward strongly as the champion of the Liberal Imperialist section.

In deference to the wishes of supporters such as Mr Asquith, Sir Henry Fowler, and Sir Edward Grey, he determined to "put his views into the common stock" at a representative meeting of Liberals held at Chesterfield in December 1901. There he advised the Liberal party that "its slate must be cleaned," and, as he subsequently explained, this cleansing must involve the elimination of Home Rule for Ireland. His appeal for "spade work" resulted in the formation of the Liberal League, inside the Liberal Opposition; and what Lord Rosebery himself described as his "definite separation" from Sir Henry Campbell-Bannerman's "tabernacle" took place. This announcement, however, was no sooner made than it was explained away by the supporters of both, and early in 1902 Lord Rosebery spoke at the National Liberal Club in a way which indicated that an understanding might still be arrived at. But, as he candidly admitted in a recent speech delivered at the Liberal League dinner, 31st July 1902, the principles of Liberal Imperialism have not yet prevailed, and until they prevail the reconciliation of the two wings of the party may, in Lord Rosebery's opinion, remain impossible.

In 1900 he published a volume called *Napoleon: the Last Phase*, an ingenious, if paradoxical, attempt to vindicate Napoleon's conduct during his exile at St Helena; and he also showed his interest in literature by an address on Biography at Edinburgh. His family consists of two sons and two daughters, his elder son, Lord Dalmeny, having been born in 1882. His younger daughter was married in 1899 to the earl of Crewe, who as Lord Houghton was Lord Lieutenant of Ireland, 1892–95.

Rosecrans, William Starke (1819–1898), American soldier, was born in Kingston, Ohio, 6th September 1819, and graduated in 1842 from the U.S. Military Academy. After serving (1843–47) as assistant professor at West Point, and in fort construction, he resigned, April 1854, from the army and went into business in Cincinnati. Early in the Civil War he organized Ohio regiments, and in June 1861 was made colonel of the 23rd Ohio volunteers, and afterwards a brigadier-general of regulars. He was second to General McClellan in the operations in West Virginia, fought and won at Rich Mountain, 11th July 1861, and succeeded to the command when McClellan was called to Washington. In March 1862 he was made a major-general of volunteers, and by and by was sent to the west, where he served under Generals Hallock and Grant. After the battles of Iuka (19th September) and Corinth (3rd–4th October), he was transferred to the command of the department of the Cumberland, to relieve General Buell. This command he held for a year from October 1862, with brilliant successes alternating with disappointments. He beat the Confederate General Bragg in the bloody battle at Murfreesboro, 31st December 1862–1st January 1863; and then, after long inaction, resumed operations the next summer, and in the fighting between 24th June and 3rd July 1863 drove his adversary out of Middle Tennessee; next, after some delay, he pursued and compelled Bragg, 9th September, to withdraw from impregnable Chattanooga. But he had lost favour, and misfortune now overtook him: he was defeated, 19th–20th September, at Chickamauga, and forced back to Chattanooga, to which Bragg laid confident siege. When General Grant took full direction, Rosecrans was succeeded, 20th October, by General Thomas. After a brief service

in Missouri, Rosecrans was relieved, December 1864. Resigning from the army 1867, he was minister to Mexico 1868, and between 1869 and 1881 was engaged in railway and industrial enterprises there. He was a member of Congress, from California, 1881–85, and register of the Treasury, 1885–93. Under an Act of Congress he was, 2nd March 1889, restored to the rank of brigadier-general, and retired. He died near Redondo, Cal., 11th March 1898. On 17th May 1902 his body was reinterred with military honours in the National Cemetery at Arlington, in the presence of President Roosevelt, members of the Cabinet, and many of his campaigning comrades.

Rosenheim, a town and watering-place of Bavaria, Germany, district of Upper Bavaria, on the river Inn, 40 miles by rail south-east of Munich, frequented for its saline, sulphur, and other springs. There are important salt-works, the brine being conveyed from Reichenhall in pipes; also machine factories, metal-works, and breweries. Population (1885), 9257; (1900), 14,247.

Rosieres. See SUDAN, ANGLO-EGYPTIAN.

Roskilde, or ROESKILDE, a market-town of Denmark, capital of Roskilde county, 20 miles by rail west of Copenhagen, during the Middle Ages next after Schleswig the most important town of Denmark. Here is the Danish Westminster Abbey, with numerous monuments and tombs of Danish kings and queens. Other public buildings are the town-hall (1883), hospital (1878–80), diocesan library (in part 15th century, in part 1858–59), royal palace (1733), institute for daughters of noblemen (1670), church of Our Lady (originally 11th century, rebuilt 1242, restored 1864–65). Population (1890), 6974; (1900), 8368.

Roslavl, a district town of Russia, in the government and 67 miles south-south-east of the town of Smolensk, on the railway from Orel to Riga and on the highroad between St Petersburg and Warsaw, near the Oster river. It is a very old town, founded by Vladimir Monomach, and often mentioned in the annals after 1150. It frequently changed hands between Russia and Lithuania, before it was finally annexed by Russia in 1686. It has two gymnasia, a railway technical school, and a number of philanthropic institutions, and carries on an active trade in flax, hemp, corn, hides, and tobacco. In 1897 the population numbered 17,848.

Rosmead, Hercules George Robert Robinson, 1ST BARON (1824–1897), British colonial administrator, was born on 19th December 1824. He was of Irish descent on both sides; his father was Admiral Hercules Robinson, his mother a Miss Wood of Rosmead, Co. Westmeath, from which he afterwards took his title. Passing from Sandhurst into the 87th Foot, he attained the rank of captain; but, deciding that the army was not his proper vocation, he obtained in 1846, through the influence of Lord Naas, a post in the Board of Public Works in Ireland, and subsequently became chief commissioner of fairs and markets. The energy he displayed in these positions, notably during the great famine of 1848, and the clearness and vigour of his reports, secured for him at the age of thirty the office of president of the island of Montserrat. Subsequently he was governor of St Christopher, from 1855 to 1859, when he was knighted in recognition of his services in introducing coolie labour into the island; of Hong-Kong; of Ceylon (K.C.M.G. in 1869); and in 1872 of New South Wales. It fell to his lot to annex the Fiji Islands to the British Empire, and his services were rewarded in 1875 by promotion to G.C.M.G. In 1879 he was transferred to New Zealand, and in 1880 he succeeded Sir Bartle Frere as high commissioner of South Africa. He arrived in South Africa shortly before the disaster of Majuba, and was one of the commissioners for negotiating a peace which was personally distasteful to him. It left him with the task of conciliating on the one hand a Dutch party elated with victory, and on the other hand a British party almost ready to despair of the English connexion. He was called home in 1883 to advise the Government on the terms of the London Convention of 1884. Charged on his return with a protectorate over the natives of Bechuanaland, he soon found that the excesses of the Boer settlers in Goshen and Stellaland must be put down by the Imperial authority. His declaration, that the advice of his ministers to patch up a settlement was equivalent to a condonation of crime, led to the expedition of Sir Charles Warren and the annexation of Bechuanaland. A dispute arose between Robinson and Sir C. Warren, who declared that the high commissioner's duties to the home Government were at times in conflict with the action which, as governor of Cape Colony, he was bound to take on the advice of his ministers in the interests of the colony. Sir Hercules Robinson succeeded in winning the confidence of President Kruger by his conspicuous fair-mindedness, while he heartily seconded Mr Rhodes's efforts to unite the British and Dutch parties in Cape Colony, and to open up its territory to the north. His cast of mind, however, was essentially that of the administrator as distinguished from the statesman, and he was content to settle difficulties as they arose. In 1886 he investigated the charges brought against Sir John Pope-Hennessy, governor of Mauritius, and decreed his suspension pending the decision of the home authorities, who eventually reinstated Pope-Hennessy. Robinson retired in 1889. In his farewell speech he declared that there was no permanent place in South Africa for direct Imperial rule. This was absurdly interpreted to mean that South Africa must ultimately become independent—an idea wholly repugnant to his mind. He himself explained in a letter to *The Times* in 1895 that he had referred to the "direct rule of Downing Street over the Crown colonies, as contrasted with responsible colonial government." He was made a baronet in 1891. Early in 1895, when he had entered his 71st year and was by no means in robust health, he yielded to the entreaties of Lord Rosebery's cabinet, and went out again to South Africa, in succession to Sir H. Loch. His second term of office, however, was not fortunate. The Jameson Raid produced a permanent estrangement between him and Mr Rhodes, and he was out of sympathy with the new colonial secretary, Mr Chamberlain, who had been prominent in criticizing his appointment, and now desired Robinson to take this opportunity of settling the whole question of the Uitlanders in the Transvaal. Robinson curtly answered that the moment was inopportune, and that he must be left to choose his own time. Alarmed at the imminent danger of war, he confined his efforts to inducing the Johannesburgers to lay down their arms on condition that the raiders' lives were spared, not knowing that these terms had already been granted to Jameson. He came home to confer with the Government, and was raised to the peerage as Baron Rosmead. He returned to South Africa later in the year, but was compelled by ill-health, in April 1897, to quit his post, and died in London on 28th October 1897. (H. SY.)

Ross and Cromarty, a highland county of northern Scotland, bounded on the N. by the Dornoch Firth and Sutherlandshire, on the E. by the Moray Firth, on the S. by Inverness-shire, and on the W. by the Atlantic.

Area and Population.—In 1891 the counties of Ross and Cromarty were amalgamated, the latter having previously been made up of detached portions scattered through the former. At the same time some alterations were made in the boundaries

between the united county and the shires of Inverness and Nairn, the parish of Urray being restricted to Ross-shire and part of the Inverness parish of Kilmorack being added to it, and the parish of Urquhart and Logie-Wester, which had been divided between Ross and Nairn, being placed wholly in the former county. The county includes Lewis and a number of smaller islands. The official estimate of the area is 2,049,423 acres, or about 3202 square miles. The population was, in 1881, 78,547; in 1891, 77,810; in 1901, 76,421; in 1891 on the above area, 78,727, of whom 37,279 were males and 41,448 females; in 1901 it was 76,421. On the old area, taking land only (1,970,004 acres, or 3078·1 square miles), the number of persons to the square mile was 24·8, and the number of acres to the person, 25·7. In the registration county the decrease of the population between 1881 and 1891 was 1·06 per cent. Between 1881 and 1891 the excess of births over deaths was 8605, and the decrease of the resident population 824. The following table gives particulars of births, deaths, and marriages in 1880, 1890, and 1899:—

Year.	Deaths.	Marriages.	Births.	Percentage of Illegitimate.
1880	1197	363	2087	4·6
1890	1299	303	1893	4·6
1899	1277	345	1809	4·3

The following table gives the birth-rate, death-rate, and marriage-rate per thousand of the population for a series of years:—

	1880.	1881–90.	1890.	1891–98.	1899.
Birth-rate .	26·20	25·36	24·05	24·27	23·26
Death-rate .	15·03	15·74	16·50	16·76	16·42
Marriage-rate .	4·56	4·18	3·85	4·08	4·43

At the census of 1891, 38,018 persons were returned as Gaelic-speaking, and of these 18,620 spoke Gaelic only; there were 43 foreigners. Valuation in 1889–90, £277,948; 1899–1900, £275,996.

Administration.—The county returns a member to Parliament, and contains Fortrose (1179), one of the Inverness group of parliamentary burghs, and Cromarty (1233), Dingwall (2519), and Tain (2074), which belong to the Wick or northern group. All of these are royal burghs except Cromarty, and Dingwall is the county town. Police burghs are Invergordon (1014) and Stornoway (3711). There are 33 civil parishes, and there are poorhouses at Tain and Fortrose; the number of paupers and dependents in September 1899 was 3339. Ross and Cromarty forms a sheriffdom with Sutherland, and there are resident sheriffs-substitute at Dingwall and Stornoway, the former sitting also at Tain and Cromarty.

Education.—Thirty-five school boards manage 135 schools, which had an average attendance of 11,747 in 1898–99, while 5 voluntary schools (1 Episcopal) had 236. There are academies at Tain and Fortrose, and 33 schools in all earned grants in 1898 for giving higher education. The county council hands over the "residue" grant to the county committee on secondary education, which subsidizes science and art classes in various schools and higher grade (science) schools in process of being built at Dingwall, Tain, and Stornoway.

Agriculture.—Oats are the predominant corn crop, and the barley acreage is rather less than half the oats acreage. Wheat shows a tendency to recover after a prolonged and continuous decline from 7527 acres in 1854 to 694 in 1897; it was 1090 in 1898. The following table gives the principal acreages at intervals of five years from 1880:—

Year.	Area under Crops.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1885	134,899	47,639	26,496	40,819	19,075	370
1890	136,974	46,082	26,326	41,662	22,621	469
1895	137,703	44,878	25,809	40,405	26,957	135
1899	141,324	44,206	24,330	43,219	29,342	196

The following table gives particulars of the live stock during the same years:—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or Calf.	Sheep.	Pigs.
1885	7365	42,976	17,811	309,590	6770
1890	7256	41,685	17,678	311,933	6359
1895	8060	41,922	17,622	320,969	5201
1899	8093	43,965	18,126	326,144	4790

At the date of the last return, 1895, the average size of the 7221 holdings was 19 acres; the percentage under 5 acres was 59·80, between 5 and 50, 32·61, and over 50 acres 7·59. Only Sutherland has a larger proportion of holdings under 5 acres. The total number under 20 acres was 6269; between 50 and 100 acres 229; between 100 and 300 acres, 231; between 300 and 500, 77; between 500 and 1000, 10, and there was one over 1000 acres. The excessive proportion of small holdings is partly due to the overcrowding of the island of Lewis (*q.v.*). There were 61,482 acres under wood in 1895, and the cultivated area was 6·8 per cent. of the whole. From the commencement of the operations of the Crofters' Commission in 1886 down to the end of 1898, 1097 applications to fix a fair rent were dealt with, and rents of a total amount of £16,182 were reduced to £11,509, while arrears amounting to £41,988 out of £59,801 were cancelled; 438 applications for enlargement of holdings were dealt with, and 400 acres were added to existing holdings. Deer forests covered 795,545 acres in 1899, an increase of 147,662 since 1883, and the annual value of the whole was £34,776.

Industries and Trade.—According to the census of 1891, 14,407 men and 3221 women were engaged in agriculture and fishing, and 9947 men and 3032 women in agriculture alone. The county contains two fishery districts, Stornoway and Cromarty, and part of two others, Lochbroom (which includes part of Sutherland) and Lochcarron and Skye (which includes part of Inverness). The following table gives particulars of the industry for the first three districts:—

Year.	Boats.			Value of Gear.	Resident Fishermen and Boys.	Total Value of All Fish.
	No.	Tons.	Value.			
1890	2443	15,291	£62,725	£79,031	8646	£198,118
1898	1383	9,476	£14,509	£47,318	6718	£179,804
1899	1312	8,672	£41,271	£46,567	6236	£118,671

£73,294 of the total value of fish in 1899 represented the value of the herring catch. The number of persons employed in 1899 in connexion with the various branches of the sea fisheries was 10,044. In Ross and Cromarty alone there are about 100 ports, which had, in 1898, 1372 boats of 8818 tons, and 6291 resident fishermen and boys. The Black Isle (1894) and Kyle (1897) branches of the Highland Railway added 24 miles to the mileage of the country.

(W. WA.)

Rossetti, Christina Georgina (1830–1894), English poet, was the youngest of the four children of Gabriele and Frances Mary Rossetti. She was born at 38 Charlotte Street, Portland Place, London, on the 5th of December 1830. She enjoyed the advantages and disadvantages of the strange society of Italian exiles and English eccentrics which her father gathered about him, and she shared the studies of her gifted elder brother and sister. As early as 1847 her grandfather, Gaetano Polidori, printed privately a volume of her *Verses*, in which the richness of her vision was already faintly prefigured. In 1850 she contributed to *The Germ* seven pieces, several of which are still among the very finest of her lyrics. In her girlhood she had a grave, religious beauty of feature, and sat as a model not only to her brother Gabriel, but to Mr Holman Hunt, to Madox Brown, and to Millais. In 1853–54 Christina Rossetti for nearly a year helped her mother to keep a day-school at Frome in Somerset. Early in 1854 the Rossettis returned to London, and the father died. In poverty, in ill-health, in extreme quietness, she was now performing her life-work. She was twice sought in marriage, but each time, from religious scruples, she refused her suitor; on the former of these occasions she sorrowed greatly, and her suffering is reflected in much of her early song. In 1861 she saw foreign countries for the first

time, paying a six weeks' visit to Normandy and Paris. In 1862 she published what was practically her earliest book, *Goblin Market*, and took her place at once among the poets of her age. In this volume, indeed, is still to be found a majority of her finest writings. *The Prince's Progress* followed in 1866. In 1867 she, with her family, moved to 56 Euston Square, which became their home for many years. Christina's prose work *Commonplace* appeared in 1870. In April 1871 her whole life was changed by a terrible affliction of the head, known as "Graves's disease"; for two years she was not merely very ill, but her life was in constant danger. She had already composed her book of children's poems, entitled *Sing-Song*, which appeared in 1872. After a long convalescence, she published in 1874 two works of minor importance, *Annus Domini* and *Speaking Likenesses*. The former is the earliest of a series of theological works in prose, of which the second was *Seek and Find* in 1879. In 1881 she published a third collection of poems, *A Pageant*, in which there was evidence of slackening lyrical power. She now gave herself almost entirely to religious disquisition. The most interesting and personal of her prose publications (but it contained verse also) was *Time Flies* (1885), a sort of symbolic diary or collection of brief homilies. She collected her poetical writings in 1891. In 1892 she was led to publish a very bulky commentary on the Apocalypse, entitled *The Face of the Deep*. After this she wrote little. Her last years were spent in great retirement at 30 Torrington Square, Bloomsbury, which was her home from 1876 to her death. In 1892 her health, always extremely delicate and fluctuating, broke down finally, and she had to endure very terrible suffering. From this she was at length released on the 29th of December 1894. The Bishop of Durham, Dr Westcott, with whom she had been greatly in sympathy, preached her funeral sermon, and a memorial to her, designed by Sir E. Burne-Jones, was erected at Christ Church, Woburn Square, where she habitually worshipped. In spite of her manifest limitations of sympathy and experience, Christina Rossetti takes rank among the foremost poets of her time. In the purity and solidity of her finest lyrics, the glow and music in which she robes her moods of melancholy reverie, her extraordinary mixture of austerity with sweetness and of sanctity of tone with sensuousness of colour, Christina Rossetti, in her best pieces, may challenge comparison with the most admirable of our poets. The union of fixed religious faith with a hold upon physical beauty and the richer parts of nature has been pointed to as the most original feature of her poetry. Hers was a cloistered spirit, timid, nun-like, bowed down by suffering and humility; her character was so retiring as to be almost invisible. All that we really need to know about her, save that she was a great saint, was that she was a great poet. (E. G.)

Rossetti, Dante Gabriel Charles (1828–1882), English painter and poet. A biography of Dante Gabriel Rossetti is given in the ninth edition of this Encyclopædia (vol. xx. p. 857), in which his career, more especially as a poet, is treated. It is felt, however, that the view there taken of Rossetti as a painter, and the account given of his artistic work other than literary, require, in the light of the history of the subsequent developments of Rossetti's influence on British art, to be supplemented; and in this article, accordingly, Rossetti's record solely as an artist is briefly estimated, without any reference to other considerations. It is certain that throughout his own career he looked upon himself as a painter who wrote rather than as a verse-maker who painted. Nevertheless, there can be no doubt that with regard to the constructive portion of his genius Rossetti was better equipped in verse than in design. He made himself an artist by means of enormous pains and amazing struggles against the difficulties imposed by a naturally desultory habit.

It was rather late in 1843 that Gabriel Rossetti entered Sass's art school (then conducted by Mr Cary), which was in great repute, and numbered John Everett Millais among its pupils. Here, working in a characteristically irregular manner, but making more progress than met the eye, he remained till July 1846, when, having passed the probationary stage required at the Royal Academy, he was admitted a student in full: he did not aspire to grades higher than that of the Antique School, but continued to divide himself between drawing proper, poetic reading, and writing poetry. Time passed, and Rossetti, being much impressed by some of the early works of Ford Madox Brown exhibited at the Academy (1841), Westminster Hall (1844–45), and the British Institution (1845), sought from that master of technique technical instruction of a more direct and stringent kind than he had previously submitted to. Brown, ever generous in that way, undertook without a fee the training of Rossetti as a painter, and set him to work upon such rudimentary studies as pickle-pots and other "still-life." The pupil's course of such work was, as might be expected, short; the master's example and that of Millais, together with the uncompromising energy of Mr Holman Hunt, with both of whom Rossetti became intimate about this time, helping and encouraging him. Most of all, perhaps, so far as his temporary impressions were concerned, a picture of Brown's which was shown at the "Free Exhibition," Hyde Park Corner, in the spring of 1848 profoundly affected Rossetti. This was, of course, months before the formation of the Pre-Raphaelite Brotherhood in the autumn of the last-named year, when five painter-students, a sculptor (Thomas Woolner), and a layman (W. M. Rossetti) agreed upon certain principles they desired should obtain in art. None of the five owed the initiative of his views to any of the others or to Brown, whose impulse was purely technical and connected with Rossetti only; neither Millais, Holman Hunt, J. Collinson, nor F. G. Stephens needed the help of Madox Brown. The point of Pre-Raphaelite crystallization which had so great though brief an influence upon Rossetti's life and art was found at a chance meeting of Rossetti, Millais, and Holman Hunt in Millais' house in Gower Street, where certain prints from early Italian frescoes were studied. The enthusiasm of Rossetti led him to propose the formation of a "Brotherhood" with more or less definite views and much loftier aims than artists generally venture to announce. This took effect; the views of the remaining three men were already known, and in a few days they joined the new society and took their shares in the obloquy which attended the doings of Millais, Hunt, and Collinson. Brown, though invited, declined to become a P.R.B. Rossetti's first effort was by means of "The Girlhood of Mary, Virgin," which in March 1849 was exhibited at Hyde Park Corner. It was a picture which attested the prodigious value of his studies since the previous October, and the native genius of the painter and the sincere passion with which he had accepted the obligations of Pre-Raphaelitism, as they were then, but not for long, understood. Nothing of his producing was more independent than the inception of "The Girlhood of Mary, Virgin"; indeed (as the present writer believes) the design for it was made some half a year before the meeting in Gower Street, though the execution of this work owed not a little to the influence, if not the actual help, of Millais and Hunt. Its mysticism was Rossetti's own, its technique owed something to Brown. On the whole, there can be no doubt that in this work was the first pronouncement of a

new view of art, a fresh technique and power rapidly developing itself. Of course, the style of this noteworthy and epoch-marking picture was jejune, its handling was timid, while its coloration and tonality were dry, not to say thin. Such was Rossetti's advent in art under the Pre-Raphaelite banner. The picture's reception was not encouraging, nor did the next work from his hands induce him to emerge from that proud exclusiveness in which all such minds as his are content to abide. The diverse moods of the other Brothers chose otherwise, but of Rossetti's immediate circle it has been truly said: "It appears that of seven young men and Brethren five have attained eminent positions, four of them being pre-eminent, although for years after the society was formed no single member, whatever his position might be, escaped insult, obloquy, and wicked and malicious misrepresentation. The more conspicuous the Brother [*e.g.*, Millais], the more outrageously was he attacked." No estimate of Rossetti's genius, his triumph, and his life as a whole can be justly based without ample allowance being made for the circumstances which attended his advent as a painter. "Ecce Ancilla Domini!" the smaller picture which is now in the National Gallery of British Art at Millbank, was the natural sequence to that which we have been considering. It is so well known that its name suffices now, but it should be recognized as the one perfect outcome of the original motive of the Pre-Raphaelite Brotherhood by its representative and typical member. It is replete with the mystical mood which then ruled the painter's mind; that mood chose what may be called virginal white and its harmonies as its aptest coloration, and the intense light of morning sufficed for its tonality. It was exhibited at the Portland Gallery in 1850. After these pictures were finished, the outside world saw no more of Rossetti as a painter until it had prepared itself to see modern art from a higher plane than before.

In December 1850 there appeared the first number of *The Germ*, a magazine in which Rossetti had a leading place as the poet in verse and prose. The influence of Browning upon Rossetti was more potent in *The Germ* than in that splendid romance in water-colours called "The Laboratory," where a court lady of the *ancien régime* visits an old poison-monger to obtain from him a fatal potion for her rival in love. This wonderful gem of colour, glowing in lurid and wicked passion and voluptuous suggestion, marked the opening of the artist's second period and signalized his departure from that phase of Pre-Raphaelitism of which "Ecce Ancilla Domini!" was the crowning achievement, and, so far as he was concerned, the artistic *ne plus ultra*. Millais and the other Brothers remained faithful during several years yet to come. Later in 1850, Rossetti produced the original, which is in ink, of the famous "Hesterna Rosa," a gambling scene of men and their mistresses in a tent by lamplight, while pallid dawn gathers force between the trees without. Then came from his hands "Borgia," which, like "The Laboratory," is in water-colours, and, like "Hesterna Rosa," is a sardonic tragedy. "How they met Themselves" came next, and, in illustrating a legend similar to that of the Döppelgänger, affirmed the force, the originality, and the tragic passion of Rossetti's genius. Two lovers are walking in a twilight wood, where they are confronted suddenly by their apparitions, portending death. The year 1852 produced "Giotto painting Dante's Portrait," and saw a new development of the painter's mind and mood, dashed with a humour not often to be seen in him. In its somewhat dry coloration it differed from the ardent jewel-like glow and deeper gloom of "Borgia" and its successor and the sumptuous visions of womanhood in later pictures. "Found," Rossetti's sole contribution of the sort which Mr Holman Hunt affected, was begun somewhere about this period; but this piece of pictorial moralizing (the analogue of the poet's own "Jenny"), vigorous and intensely pathetic as it is, was never really finished by its author, being, indeed, far remote from Rossetti's inner self, which was rather over-scornful of didactic art, and thoroughly indisposed towards attempts to ameliorate anybody's condition by means of pictures. Nor did the stringency of naturalistic painting suit his mood or his experience. Nevertheless, what is his in the existing picture remains a masterpiece of poetry with exquisitely finished parts.

Passing a few fine but comparatively unimportant drawings, such as "Lancelot and Guinevere at the Tomb of Arthur," "Lancelot looking at the Dead Lady of Shalott," "Mariana of the South," "Sir Galahad," "The Blue Closet," and various works owing subjects to the Arthurian cycle of romances, we may note that the artist illustrated by five cuts *Poems by Alfred Tennyson*, on which Millais and Mr Holman Hunt were also engaged, and which was published by Moxon in 1857. As in "Ecce Ancilla Domini!" we had virginal white and morning light employed to strengthen the mystical significance of the design, so in "Borgia" Venetian voluptuousness and sensuous splendours obtained, and in "The Blue Closet" is a very potent and suggestive exercise intended to symbolize the association of colour with music. The last is one of the subtlest of the artist's "inventions," and it shows how he had developed upon "Borgia" an artistic sympathy which is but too likely to be "caviare to the general." "The Wedding of St George" is not so fine; nor was "The Damsel of the Sangreal," Rossetti's part in the luckless decorations of the Oxford Union (1857–58); nor are "Guinevere and Sir Lancelot," "Galahad in the Chapel," and other Arthurian examples quite worthy of his art. "Bocca Baciata," the super-sensuous portrait of a woman, a work of wonderful fire, and the pictures on the pulpit at Llandaff Cathedral, marked the expiration of the second epoch in Rossetti's art and the beginning of a new, the third, last and most powerful of all the phases of his career. The picture "Dr Johnson at the Mitre," when the "pretty fools" consulted the lexicographer anent Methodism, is a good example of his humour.

In 1861 Rossetti produced several fine designs for stained glass, and in the revival of stained-glass painting as an art he had a larger share than has frequently been ascribed to him. The practice of designing upon a large scale, and employment of masses of splendid though deep-toned colours, had probably something to do with the prodigious development of his powers and the enlargement of his views as regards painting which took effect at this period (1862–63). At this time a striking and highly imaginative triptych, representing three events in the careers of Paolo and Francesca, was produced; it is a great improvement upon an earlier design. There is unprecedented energy in the group of the lovers embracing in the garden-house just as they have paused in reading the fatal romance. The composition of this group, with the circular window behind their figures, is as fine as it was comparatively novel in Rossetti's practice. Its lurid coloration was so thoroughly in harmony with the pathos of the subject that in this respect the work excelled all the painter had previously produced. The same elements, energy, a sympathetic and poetic scheme of colour, and composition of a fine order, combined with far greater force and originality in "The Bride," or "The Beloved," that magnificent illustration of The Song of Solomon. The last named is a life-size group of powerfully coloured and diversely beautiful damsels accompanying their mistress with music and with song on her way to the bridegroom. This picture, as regards its brilliance, finish, the charms of four lovely faces, and the splendour of its

"ECCE ANCILLA DOMINI!" BY DANTE GABRIEL ROSSETTI.
(From a Photograph by Frederick Hollyer.)

lighting, occupies a great place in the highest grade of modern art of all the world. It is likewise, so far as the qualities named are concerned, the crowning piece of Rossetti's art, and stands for him much as the "Sacred and Profane Love" of Titian represents that master. Very fine, indeed, but hardly so passionate and virile, is the "Beata Beatrix," now in the National Gallery of British Art with "Ecce Ancilla Domini!" which he produced thirteen years earlier. These works belong to a category of fine and quite original examples, all replete with similar technical qualities, poetry, and pathos. The group comprises paintings by which Rossetti is best known, such as "Proserpina in Hades," which is, on the whole, perhaps the most original, if not indeed the most poetical and powerful, of all his output; "Sibylla Palmifera;" "Venus Verticordia;" "Lilith" (the better of the two versions is now referred to); "Washing Hands;" "Monna Vanna;" "Il Ramoscello;" "Aurea Catena;" "La Pia;" "Rosa Triplex;" "Veronica Veronese;" "La Ghirlandata;" "Pandora;" "The Blessed Damosel;" and, last and largest, but not, perhaps, the greatest, of his paintings (a distinction for which the "The Bride" and "Proserpina" must contend), the famous "Dante's Dream," now in the Walker Art Gallery at Liverpool. Besides these, Rossetti produced a large number of fine things. Nearly the whole of them were exhibited by the Royal Academy and at the Burlington Fine Art Club in 1883, after their author's death.

Rossland, the most important city (incorporated in 1897) of the Kootenay district of British Columbia, the centre of a rich mining district. Some of the best known mines of British Columbia are in the neighbourhood of Rossland, which has been connected with the Canadian Pacific Railway, as well as with systems belonging to United States companies. It is distant a few miles by railway from Trail, on the banks of the Columbia, where an extensive smelting plant is in operation. Population (1901), 6159.

Rosslau, a town of Germany, duchy of Anhalt, on the right bank of the Elbe, by rail 3 miles north of Dessau and 35 south-east of Magdeburg. It has two castles, a good church, and produces machinery, paper, sealing-wax, wire goods, sugar, bricks, and chemicals, and has some boat-building. Population (1885), 6567; (1900), 10,061.

Rostock, a seaport town of Germany, grand-duchy of Mecklenburg-Schwerin, on the Warnow, 8 miles above its entrance into the Baltic, and 46 miles by rail south-west of Stralsund. An assembly hall of the estates of Mecklenburg was built in the Gothic style in 1889–93. Other buildings, &c., include the theatre (1895) and the provincial lunatic asylum (1896), the latter on the right bank of the river. In 1900 the university was attended by 495 students and had 55 professors; its library numbers some 175,000 volumes. Amongst the public institutions are the zoological, geological-mineralogical, commercial, and several medical institutes, the municipal picture gallery, a collection of municipal antiquities, a theological seminary, an astronomical observatory, an agricultural experimental station, a seamen's school, and a botanical garden. Rostock is the chief commercial town of Mecklenburg, and owns a considerable fleet—49 vessels of 30,170 tons in 1900. In 1898 its port was cleared by 1743 vessels of 342,900 tons. Vessels drawing 16 feet are able to get up to the wharves. It is also a place of some industry. For a German town it enjoys a large share of autonomous government. Population (1885), 39,356; (1900), 54,713.

Rostov-on-the-Don, a seaport of Russia, in the province of the Cossacks of the Don, 40 miles from the Sea of Azov. Its population has grown rapidly, and in 1897 numbered 119,889, exclusive of the suburbs; if these, which already form part of the town and comprise Nakhichevan (29,312), be included, the population is well over 150,000, a figure which is still further swollen in the summer by the influx of about 60,000 men, who find work in connexion with the shipment of grain for export. Owing to its very advantageous situation, on the navigable river Don and at the junction of three railways radiating to north-western Russia, the Caucasus, and the Volga, Rostov has become the chief seaport of south-eastern Russia, being second in importance on the Black Sea only to Odessa. It has immense storehouses for all sorts of goods shipped to the Caucasus and to the Don province, and is the chief centre for the supply of agricultural machinery to all the prairie provinces of south-eastern Russia. Its foreign exports, which were valued at 41,000,000 roubles in 1882, were only 37,000,000 roubles in 1895; but on an average 35,000,000 roubles worth of wheat and 10,000,000 roubles worth of rye are exported annually, besides considerable quantities of flax, vegetable oils, raw wool, and caviare. The imports are insignificant. There are now a shipbuilding yard, two large tobacco factories, iron works, machinery works, distilleries, soap works, timber mills, bell foundries, paper mills, and rope works. Rostov is the chief centre of steam flour mills for south-eastern Russia and the Caucasus. The aggregate returns from all industrial establishments exceed £2,000,000 per annum. In 1897 the port was visited by 2840 ships of about 450,000 tons. The town is well built, and has about sixty schools, gymnasia, navigation schools, technical schools, &c., the city contributing freely to education. It has also a good municipal library, two theatres, two newspapers, and extensive systems of telephones and electric tramways.

Rostov Velikiy, a district town of Russia, in the government and 34 miles by rail south-west of the town of Yaroslav, near Lake Rostov or Nero. It has a gymnasium for girls and a school of art, and there are twenty-one factories (cotton and linen mills), employing about 1000 workmen and showing yearly returns of 1,000,000 roubles. Its great fair has lost its importance, but the town remains a centre for a variety of domestic trades: tailoring, the manufacture of leather, and the making of boots and small enamelled ikons; it is also a great centre for kitchen gardening and the export of pickled and dried vegetables. The restoration of the buildings of the large Kreml was begun in 1901. Its population in 1897 was 14,342.

Rothenburg ob der Tauber, a town of Bavaria, district of Middle Franconia, 49 miles by rail west by south of Nuremberg. It presents a characteristically mediæval appearance, with walls pierced by picturesque old gates. Amongst the more interesting buildings are the town-hall (1578 and earlier), hospital (1570–76), Topler Castle, the church of St James (1373–1471, restored in 1851), with three carved altar-pieces of the 15th century, and St Wolfgang's church (1473–83). It also possesses a technical school, interesting archives, and manufacture of toys, agricultural machinery and implements, brewing, dyeing, &c. Rothenburg, which is first mentioned in 942, was a free imperial city from 1172 to 1803. In

the Thirty Years' War it suffered severely. Population (1885), 6826; (1900), 7923.

Rotherham, a municipal borough and market town, Yorkshire, England, in the Rotherham parliamentary division of the West Riding, 5 miles north-east of Sheffield by rail. The manufacture of railway waggons is now an important industry. Population of municipal borough (1891), 42,061; (1901), 54,348.

Rothesay, a royal burgh and the chief town of the county and island of Bute, Scotland, on a fine bay, 40 miles west by north of Glasgow. Fishing has left the port, which is almost exclusively given up to the Clyde passenger and tourist traffic. Modern buildings are a hydropathic (rebuilt after fire), a second institute (1885), and a new post office; there are also a Roman Catholic orphanage and an academy. Population (1891), 9108; (1901), 9323.

Rottenburg, a town and episcopal see of Würtemberg, Germany, on the left bank of the Neckar, which is crossed by two bridges connecting the town with the suburb of Ehingen, 7 miles by rail south-west of Tübingen. It is the see of the Roman Catholic bishop of the kingdom, and possesses the (Gothic) cathedral of St Martin, a former Jesuit monastery with a collection of Roman antiquities from Sumelocenna near by, and an old castle now used as a prison. Tanning, machinery making, brewing, and the growing of hops are carried on. Population (1900), 7027.

Rotterdam, the first commercial and the second largest city of the Netherlands, extended by the incorporation in 1886 of Delfshaven and in 1895 of Charlois and Kralingen, in the province of South Holland, 14½ miles by rail south-east of The Hague. Among the institutions of Rotterdam are a large infirmary (Groot Ziekenhuis), a school of music, a natural science society, with rich collections, and three theatres. A new building was erected in the west of the city to accommodate the archives in 1899–1900. The new waterway between Rotterdam and the North Sea, only 15 feet deep in 1880, has since been deepened to 29½ feet. The new docks opened include Rynhaven, on the left bank of the Maas, Parkhaven, the first and second Katendrechthaven, and the Dokhaven. Nassauhaven, newly constructed, also on the left bank of the river, is connected by railway with the large factories. Another dock, 143 acres in area, to cost £750,000, was in 1902 in process of construction. Between 1850 and 1897 the area of the docks increased from 96 to 309 acres, about two millions sterling having been spent on the building of docks in the final quarter of the 19th century.

The following table shows the increase in the shipping of Rotterdam from 1885 to 1900:—

	Sailing Vessels.	Steam Vessels.	Total Tonnage of Sailing and Steam Vessels.	Percentage of all Outgoing Vessels from Holland leaving Rotterdam.
1885 . .	43	50	99,018	45
1900 . .	84	101	458,968	63·1

	Tonnage of Exports from Rotterdam.	Shipping on the New Waterway.	
		Number of Ships.	Tonnage.
1885 . . .	about 2,000,000	8,177	4,382,100
1900 . . .	22,623,000	15,202	36,349,000

According to the report of the Rotterdam Chamber of Commerce, the shipping of Rotterdam with a draught of from 24 to 26½ feet, to the exclusion of smaller vessels and fishing-smacks, numbered in 1899, 6890 vessels of 9,779,229 tons. Rotterdam's share in the Rhine traffic has increased from 1,706,587 tons in 1883 to 6,494,375 tons in 1898. Of the total imports into Holland, more than 40 per cent. have in recent years entered by way of Rotterdam, and of the total imports into Holland of grain, ores, margarine, petroleum, and oils, 50 to 80 per cent. land at Rotterdam. Of the total imports into the kingdom of coffee, tobacco, rice, sugar, and seeds, Rotterdam receives respectively 49, 39, 26, 24, and 37 per cent. There are separate wharves, with six tanks, for the imports of petroleum from America and Russia. Of the total imports into Holland in 1898, estimated at 8,486,000 cwt., those entering by way of Rotterdam amounted to 5,952,000 cwt. Besides the river commerce with Germany, Rotterdam trades principally with the Dutch colonies of the East and West Indies, New York, La Plata, and the east and west coast of Africa. Shipbuilding yards, extending along the Maas to great distances above and below Rotterdam, build iron steamers and large ships, also for foreign countries. The population, 169,477 in 1884, numbered 332,185 in 1900.

See FRUIN. *De oudste Oorkonden betreffende Rotterdam.*—SCHEFFER and OBREEN. *Rotterdamsche Historiebladen.* 1869–78.—DE BAS. *Rotterdam van 1853–78.*—*Tijdschrift van het Aardrijkskundig Genootschap*, iv. 22.

Rottweil, a town of Würtemberg, Germany, above the river Neckar, 46 miles by rail south-west of Tübingen. It is still in part surrounded by walls. It possesses a fine church of the Holy Cross (1364–1473), a collection of mediæval wood-carvings, Roman antiquities, a salt mine and brine springs. Population (1885), 6052; (1900), 7970.

Roubaix, an industrial town in the north of France, situated 6 miles north-east of Lille, and only 1 mile from the Belgian frontier, on the Roubaix canal which connects the Deule with the Scheldt in Belgium. Its population has risen from 91,000 in 1881 to 124,660 in 1901. With the adjoining communes of Tourcoing, Croix, and Watrelos the combined population is 250,000. The woollen industry is the chief business of Roubaix. In 1898 there were 8 wool-combing works with 750 combing machines; 44 spinning mills (28 for combed or carded wool, 15 for cotton, 1 for floss silk); 129 weaving establishments (26 for cloth, 18 for woollen goods, 9 for velvet, 8 for upholstery, 2 for black goods, 1 for linen thread, 65 for novelties and miscellaneous goods). In 1897 Roubaix contained 39 dyeworks and 17 establishments for finishing and dressing. Mechanical work prevails in the town, as shown by the fact that there are 20,000 steam looms and only 5000 hand looms. Four hundred firms act as commission agents for the sale of raw material and the other requisites for industries. The station of the Northern Railway at Roubaix, where the merchandise arriving by goods train in 1887 amounted to 443,350 tons, in 1898 received 952,016 tons. On the canal the transport tonnage has also risen, and from 491,651 tons (English) in 1887 reached 595,322 tons in 1898. The trade of the port consists principally of building materials, agricultural produce, and coal. A modern industry is that of tomato and grape growing, under glass, for the winter market. To maintain the high standard of artistic taste which has made the industry of Roubaix a success, schools have been multiplied, and by the co-operation of the town and the State the National School of Industrial Arts has been founded. This is a small university of art, commerce, and industry, the twenty-two courses of which include all the branches of knowledge useful in any of those pursuits. There is also a special establishment (*bureau de conditionnement*) for determining the nature and weight of silk, wool, and cotton. The chief streets, lined with elegant buildings, contrast in their luxury with the poverty of the sordid working class quarters. The town, a third of the population of which

is Belgian, is a centre of socialism and collectivism. The number of public-houses is exceedingly high in proportion to the inhabitants—one for every 60 persons or for every 15 adult males.

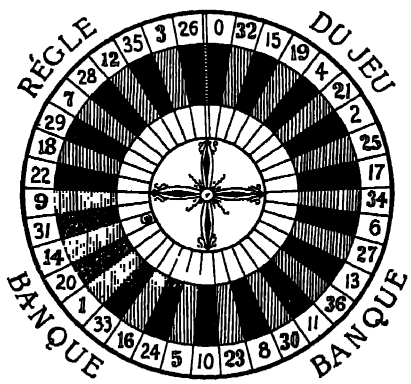
Rouen, chief town of the department of Seine-Inférieure, 84 miles from Paris by rail. It is now only the eleventh town of France in respect of population, after having occupied the fifth rank.

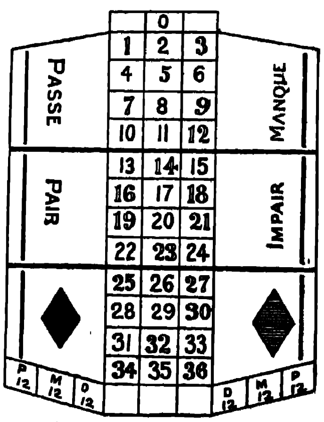
Its port on the Seine has grown in importance, but industry in general has made no progress. The port is accessible to ships of about 5000 tons, which can come up to it on a single tide. The *bassin maritime* is lined with quays and continuous wharves for a length of about 1¼ mile on both the right and left banks of the river. Its platforms cover 42 acres on the north and 33 acres on the south. Those of the *bassin aux bois* (wood dock) cover 30 acres, and there are 11 wharves of a total length of 3176 feet. The petroleum dock has 8 wharves, with a length of 2362 feet. The total available length of these docks in which ships can lie and discharge is 4 miles, and the total platform area round the docks is 111 acres. Railway lines run across the quays and connect them with the stations of Martainville on the north and of Orléans and St Sever on the south. Subterranean canalization conveys the petroleum direct from its special dock to the refineries. The river dock covers 28 acres. The maritime port has a repairing dock for vessels 312 feet long and of 1800 tons. Its quays are lighted by electricity or gas. Formerly the Seine at Rouen was crossed only by the stone bridge of Corneille and by a suspension bridge, the middle portion of which opened to permit the passage of ships. The latter has been replaced by the Boïeldieu bridge, the first steel bridge built in France, costing £140,000, and inaugurated in 1888. A slung moving bridge has a height of not less than 197 feet, and connects the banks of the Seine. Steam ferry boats also place the shores in communication. In 1899, 2604 vessels of 1,145,921 tons entered and 2637 of 1,149,382 tons cleared, showing a progression corresponding to the improvement in the channel of the Seine. The value of the exports amounted to £2,144,000, and that of the imports to £8,364,000. In 1898 the river dock was entered and cleared by 10,437 ships of 2,072,442 tons. The principal imports of Rouen are cereals (165,000 tons in 1899), wine (191,000 tons), petroleum, wood (254,600 tons), and wood pulp (39,900 tons). The exports are sugar, plaster, sand, and pyrites. On 31st December 1899 there were 176 ships of 36,669 tons attached to the port, at which 16 French and 10 foreign shipping companies call regularly. The cotton industry, which made the fortune of Rouen, and reached its highest prosperity in the middle of the 19th century, is in a depressed state. In 1896 only 1,223,442 spindles were working in the whole department of Seine-Inférieure, and the decline continued till the end of 1898. Subsequently, however, the situation somewhat improved. In 1883 there were 48 power-loom weaving mills in the department, 29 of which were in Rouen, employing 14,000 power-looms and 10,000 hand-looms. The latter are decreasing. In 1890 there were only 3700 hand-looms in the whole department. Neither has cotton-printing made progress. Rouen enjoys protective tariffs in Indo-China and Madagascar. In 1895, through an Indo-China syndicate, 1195 tons of white cotton goods, bleached and unbleached, and nearly 600 tons of coloured and printed goods were exported. Flax, hemp, and jute are spun in the neighbourhood, and there is a flourishing manufacture of braces. That of printed calico declines. In 1897, 14 firms each turned out 560,000 pieces of 1083 yards length each; 300,000 pieces were made in the homes of the workers. These products are sent to Algeria, Madagascar, &c. Dyeing progresses, 12,000 tons of cotton being dyed annually, but the bleaching and finishing industries are depressed; the manufacture of carding combs is, on the other hand, rising. Rouen is an important centre of chemical industries, producing various acids, salts of tin, lead, zinc, cobalt, and nickel. One company alone employs 800 workmen, and produces 160,000 tons of products. There are two important soap-works. The clothing industry, the manufacture of machine-made boots, which increases rapidly, and the hat industry deserve notice. The manufacture of machinery declines. There are only two important workshops making steam motors, boilers, and various machinery, and five factories for heavy copper ware and safety fittings for boilers. Much grain is distilled at Rouen, mainly maize and rice. The petroleum industry is considerable, engaging four mills, each able to produce annually from 50,000 to 60,000 tons of raw and 40,000 to 50,000 tons of refined petroleum. In 1899 Rouen imported 115,000 tons of raw petroleum from Russia and the United States. A celluloid factory has also some importance. Rouen is being improved by the gradual restoration of the grand *façade* of its cathedral. Monuments of recent erection include one to Jeanne d'Arc. The population in 1896 was 106,825, and in 1901, 115,914.

Rouher, Eugène (1814–1884), French statesman, was born at Riom, in the Puy de Dôme, 30th November 1814. He was educated at the lycée of his native town, and having taken his law degree at Paris in 1835, began to practise his profession at Riom. At this stage in his career he was a Liberal, but greatly to the astonishment of both friends and enemies, in 1846 he stood in the Conservative interest for Riom, with the support of the Guizot ministry. Though unsuccessful, he again championed the Conservative cause at the general election of 1848, and was returned to the Constituent Assembly for the Puy de Dôme. Re-elected to the Legislative Chamber in 1849, to the great surprise of the political world he became prime minister of the Prince President, with the title of Minister of Justice and Keeper of the Seals. Cautious and subservient, he was entrusted by Napoleon with the drawing up of the new Constitution after the *Coup d'État* of 2nd December 1851 had laid France prostrate at his feet. But as it required a more daring nature than that of the provincial barrister to carry the drastic scheme into effect, the cabinet was reconstructed under Marshal St Arnaud, Rouher remaining out of office. When Louis Napoleon became emperor of the French in 1852, Rouher had his reward. He re-entered the Imperial service as vice-president of the Council of State. The emperor likewise presented him with £40,000 and the estate of Cirey. In 1855 he became minister of commerce and public works. In this capacity he provided the emperor and Baron Haussmann with enormous sums of money for the rebuilding and embellishment of Paris, and for various undertakings in the provinces. To Rouher was also intrusted the important task of preparing the treaty of commerce with England, a work involving great and detailed labour. In 1860 the treaty was carried through, and some time afterwards its French sponsor visited England, where he was much fêted. Though pliant towards the emperor, Rouher was not popular with his ministerial colleagues, towards whom he assumed a haughty attitude. In 1863 he was appointed minister of state, and as such was spokesman of the Government in the Corps Législatif. Though no orator, he was now the most prominent statesman, as well as the most powerful minister, of the Second French Empire. But with men like Thiers, Berryer, and Jules Favre arrayed against him, he could only carry out the Imperial policy by a frequent use of the *clôture*, although the Government had an enormous majority in the Chamber. After a constitutional contest in the Chamber prolonged over several years, the emperor was convinced in 1869 that reforms must be granted. A manifesto was accordingly issued restoring parliamentary institutions, and M. Emile Ollivier was placed at the head of a Liberal cabinet in order to carry them out. Rouher, however, was the moving force behind the cabinet, and in January 1870 he was appointed president of the Senate. After the fall of the empire, Rouher fled to England. The rest of his life was spent as the representative of the fallen empire in France, and the faithful and untiring agent there of the Imperial family. A constituency in Corsica, which had always been faithful to the Bonapartes, returned him as deputy to the National Assembly in February 1872. From that period until the death of the Prince Imperial in 1879 he carried on a ceaseless Bonapartist propaganda, and his house in Paris was used as the headquarters of the party. In 1875 he delivered a violent speech against the Republic at Ajaccio. His prosecution was mooted, but the Government finally contented itself with dismissing the mayor of Ajaccio from office. The untoward death of the Prince Imperial was a calamity from which Rouher never recovered, and

in the summer of 1883 he was stricken with paralysis and lost his reason. His death occurred at Cirey on 3rd February 1894. (G. B. S.)

Roulette.—Roulette is one of the most ingenious games ever devised, for the reason that temptation to continue assails the player from so many directions and in so many ways: rich successes are sometimes attained, and very frequently only just missed, whilst all the time there is a steady, infallible, and undeviating bias against the player in favour of the bank. It is solely a game of chance, a fact strenuously contradicted by half-informed students, for so-called "systems" are innumerable, and some of them for a greater or a longer period often appear to give the player an advantage. There is no possible system, however, which will assure success in the long run, and it is herein that the ingenuity of the game consists. Every systematic method of play must depend upon increased stakes to retrieve past losses; and though a player with an unlimited capital might be practically certain to achieve his end in the course of time, the circumstance of there always being a maximum renders the bank invincible. The roulette table, covered with a green cloth, is made up of precisely corresponding halves, a circular space let into the middle holding the wheel, on either side of which the cloth is marked out as in the accompanying illustration. The wheel is divided into thirty-seven compartments, marked alternately black and red, numbered from one to thirty-six, the thirty-seventh being zero. *Pair* indicates even numbers, *impair* odd numbers; *manque* includes the numbers from 1 to 18; *passe*, from 19 to 36. The methods of staking are innumerable. *Rouge*, *noir*, *pair*, *impair*, *manque*, and *passe* are even chances; *i.e.*, a stake put upon any of them—five francs being the minimum at roulette—is paid in corresponding coin should the player win, the exception being when the little ball which is spun round the wheel falls into zero, in which case the even money chances are put "in prison"; that is to say, laid aside *in the place shown in the design* (the thick vertical line in the spaces marked *passe*, *pair*, *manque*, *impair* and the black and red diamonds) until another spin, when if the bank wins they are lost, if the player wins he is allowed to retrieve his money. The maximum in the case of these chances is 6000 francs. Any one who desires to play *en plein* puts his stake on one of the thirty-seven numbers. If the ball falls into the corresponding number on the cylinder, the stake is paid thirty-five times; and as there are thirty-seven numbers on the board, with the advantage already described of imprisoning the even money chances when zero comes up, it will be seen that there is a steady percentage in favour of the tables and consequently against the player. The maximum stake allowed *en plein* is 180 francs. The next most daring selection is *à cheval*, when the stake is placed on the line separating any two numbers, and if either of them wins the player is paid seventeen times, the highest stake permissible being 360 francs. *Transversale pleine* covers any three numbers in a line, the coin or note being placed on the line dividing either of the numbers from the neighbouring even money chance, as for instance between 4 and *passe*, or 6 and *manque*. A *transversale simple* covers six numbers, as for example where the line between 4 and 7 joins *passe*, or between 6 and 9 joins *manque*; and if either of these numbers wins, five times the value of the stake is paid, the maximum here being 1200 francs. *En carré* includes four numbers, the coin being placed, for instance, on the cross between 1, 2, 4, 5, or 28, 29, 31, 32; eight times the value of the stake is paid, and the maximum is 760 francs. It will be seen from the board that the dozens and the columns are also indicated, the first dozen of course including 1 to 12. In each of the columns are twelve numbers in different order. A stake placed on either a dozen or a column is paid twice its value, the maximum here being 3000 francs. A stake very constantly played is called the *quatre premiers*, which includes zero, 1, 2, and 3, the stake being placed on the line where zero and 1 join *passe*, or where zero and 3 join *manque*. If either of these four numbers, including zero, wins, the stake is paid eight times; and four times eight being thirty-two, there is a greater advantage to the table than when it loses *en plein* or on certain other chances. Zero can also be played in combination with any one or two of its neighbours; if with one of them the stake is paid seventeen times, if with two of them eleven times. A croupier sits on either side of the wheel; there is also one at each end of the table, their business being to assist the players in staking and recovering their winnings. Behind each of the former pair an official on a high chair supervises the table. The croupier whose duty it is to spin the wheel waits for a time till stakes have been made, and then, exclaiming, "Messieurs, faites votre jeu!" sets the cylinder in motion, throwing the ball in the direction contrary to that in which the wheel revolves. When it is seen that the ball will soon fall at rest in one of the compartments of the cylinder the croupier gives the notice, "Rien ne va plus," after which no stakes can be placed. When the ball finally rests in the compartment, the croupier announces the number and the even money chances that win, as for instance *rouge*, *impair*, and *manque*. He and his fellows then proceed to gather in with a rake all the money that has been lost, after which the winnings are paid and the game proceeds. (A. E. T. W.)





Roumania. See RUMANIA.

Rousseau, Pierre Etienne Théodore (1812–1867), French painter, one of the artists of Barbizon, in many ways the strongest of the group, and a landscape painter who devoted himself in his prime almost entirely to pictures of the Forest of Fontainebleau. He was an only son, and was born in Paris on 15th April 1812, of a bourgeois family which included one or two artists. At first he received a business training, but very soon displayed a special aptitude for painting. Although his father regretted the decision at first, he speedily became reconciled to his son leaving business, and throughout the artist's career (for he survived his son) was an ardent sympathiser

"MARSH IN THE LANDES." By THEODORE ROUSSEAU.

with him in all his conflicts with the Salon authorities. Théodore Rousseau shared to the full the difficulties of the romantic painters of 1830 in securing for their pictures a place in the annual Paris exhibition. The whole influence of the classically trained artists was against them, and not until 1848 was Rousseau adequately presented to the public. He had exhibited one or two unimportant works in the Salon of 1831 and 1834, but in 1836 his great work "La Déscente des Vaches" was rejected by the vote of the classic painters; and from then until after the revolution of 1848 he was persistently refused. He was not without champions in the press, and under the title of "le grand refusé" he became known through the writings of Thoré, the trenchant critic who afterwards resided in England and wrote under the name of Bürger. During these years of artistic exile Rousseau produced some of his finest pictures: "The Chestnut Avenue," "The Marsh in the Landes" (now in the Louvre, see Plate), "Hoar-Frost" (now in America); and in 1851, after the re-organization of the Salon in 1848, he exhibited his masterpiece, "The Edge of the Forest" (also in the Louvre), a picture similar in treatment to, but slightly varied in subject from, the composition called "A Glade in the Forest of Fontainebleau," in the Wallace collection at Hertford House.

Up to this period Rousseau had lived only occasionally at Barbizon, but in 1848 he took up his residence in the forest village, and spent most of his remaining days in the vicinity. He was now at the height of his artistic power, and was able to obtain fair sums for his pictures (but only about one-tenth of their value thirty years after his death), and his circle of admirers steadily increased. He was still ignored by the authorities, for while Diaz was made Chevalier of the Legion of Honour in 1851, Rousseau was left undecorated at this time, but was nominated shortly afterwards.

At the Exposition Universelle of 1855, where all Rousseau's rejected pictures of the previous twenty years were gathered together, his works were acknowledged to form one of the finest of the many splendid groups there exhibited. But during his lifetime Rousseau never really conquered French taste, and after an unsuccessful sale of his works by auction in 1861, he seriously contemplated leaving Paris for Amsterdam or London, or even New York. Misfortune then overtook him: his wife, who had been a source of constant anxiety for years, became almost hopelessly insane; his aged father looked constantly to him for pecuniary assistance; his patrons were few in number. Moreover, while he was temporarily absent with his invalid wife, a youth living in his home (a friend of his family) committed suicide in his Barbizon cottage; when he visited the Alps in 1863, making sketches of Mont Blanc, he fell dangerously ill with inflammation of the lungs; and when he returned to Barbizon he suffered from insomnia and became gradually weakened in strength. He was elected president of the fine art jury for the 1867 Exposition. His extreme disappointment at being passed over in the distribution of the higher awards told seriously on his health, and in August he was seized with paralysis. He slightly recovered, but was again attacked several times during the autumn. Finally, in November, he began to sink, and he died, in the presence of his lifelong friend, J. F. Millet, on 22nd December 1867.

Rousseau's other friend and neighbour, Jules Dupré, himself an eminent landscape painter of Barbizon, relates the difficulty Rousseau experienced in knowing when his picture was finished, and how he, Dupré, would sometimes take away from the studio some canvas on which Rousseau was labouring too long. Millet, the peasant painter, for whom Rousseau justly had the highest regard, was much with him during the last years of his life, and at his death Millet took charge of the insane wife, whose malady had so seriously harassed the artist. Rousseau was a very good friend to Diaz, teaching him how to paint trees, for up to a certain point in his career Diaz considered he could only paint figures.

Rousseau's pictures are always grave in character, with an air of exquisite melancholy which is powerfully attractive to the lover of landscapes. They are well finished when they profess to be completed pictures, but Rousseau spent so long a time in working up his subjects that his absolutely completed works are comparatively few in number. He left many canvases with parts of the picture realized in detail and with the remainder somewhat vague; and also a good number of sketches and water-colour drawings. His pen work in monochrome on paper is rare; it is particularly searching in quality.

There are a number of fine pictures by Rousseau in the Louvre, and the Wallace collection contains one of his most important Barbizon pictures. There is also an example in the Ionides collection at the Victoria and Albert Museum.

Rouxville. See ORANGE RIVER COLONY.

Rovereto, or ROVEREDO, one of the chief industrial cities of South Tirol, and, after Trent, the principal seat of the Tirolese silk manufacture. Population (1890), 9030; (1900), 10,180, Italian and Catholic (about 5 per cent. German). Leather and paper are manufactured, in addition to the staple silk industry, and there is a considerable trade in silk, sumac, corn, wine, hams, and sausages.

Rovigno, a town on the Adriatic coast, in the Austrian province of Istria, of which it is the chief trading centre. Population (1890), 9662; (1900), 10,205, Italian and Catholic. It is the principal centre of the Austrian tunny and sardine fishery. The industries, in addition to shipbuilding and the preservation of fish, include the manufacture of tobacco, cement, macaroni and similar preparations, and flour.

Rovigo, a town and episcopal see of Italy, Venetia, capital of the province of Rovigo. It stands on the low ground between the lower Adige and the lower Po, 50 miles by rail south-west of Venice, and on the Adigetto canal. Its institutions include a 17th-century campanile, a technical school, a bronze equestrian monument (1894) to Garibaldi by Ferrari, and a monument (1881) of Victor Emmanuel by Monteverde. Population (1881), 10,800; (1899), about 7500.

Rovno, a district town of Russia, in the government of Volhynia, 150 miles by rail west-north-west of Zhitomir. Population (1897), 24,905. It has several steam flour mills and Crown provision factories, and carries on an active trade in corn, cattle, and timber. Under the name of Rovensk it was one of the oldest towns of Volhynia, having been founded in the 13th century. It became subsequently a dependency of Poland, and was an important centre of trade in the 16th century. Later on

it was utterly ruined by the Cossacks and the Tatars, and was finally annexed to Russia.

Rovnoye, a town of Russia, in the government of Kherson, on the Tashlyk river, 23 miles from Bobrinets. It was founded in 1785 by runaways from all parts of Russia, and has become a wealthy town, carrying on trade in agricultural produce and the manufacture of carriages. Its population in 1897 was 24,905.

Rovuma, a considerable river in East Africa, forming during the greater part of its course the boundary between German and Portuguese territory. The lower Rovuma is formed by the junction in 38° 1′ E. of two branches of nearly equal importance, the longer of which, the Lujenda, comes from the south-west, the other, which still bears the name Rovuma, from the west. Its source lies on an undulating plateau, 3000 feet high, immediately to the east of Lake Nyasa, in 10° 45′ S., 35° 40′ E., the headstream flowing first due west before turning south and east. In its eastward course the Rovuma flows near the base of the escarpment of an arid sandstone plateau to the north, from which direction the streams, which have cut themselves deep channels in the plateau edge, have almost all short courses. On the opposite bank the Rovuma receives, besides the Lujenda, the Msinje and Luchulingo, flowing in broad valleys running from south to north. The Lujenda rises in close proximity to Lake Chilwa or Shirwa, in the small Lake Chiuta (1700 feet), the swamps to the south of this being separated from Chilwa only by a narrow wooded ridge. The stream which issues from Chiuta passes by a swampy valley into the narrow Lake Amaramba, from which the Lujenda finally issues as a stream 80 yards wide. Lower down it varies greatly in width, containing in many parts long wooded islands which rise above the flood level, and are often inhabited. The river is fordable in many places in the dry season. At its mouth it is about a mile wide. The lower Rovuma, which is often half a mile wide but generally shallow, flows through a swampy valley flanked by plateau escarpments containing several small backwaters of the river. The mouth, which lies in 10° 28′ S., is entirely in German territory, the boundary near the coast being formed by the parallel of 10° 40′. The length of the Rovuma is about 500 miles.

See *Proc. R.G.S.*, February 1882, September 1884, December 1886, April 1890 (map).

Rowing.—*United Kingdom.*—The last twenty years of the 19th century witnessed a further decline in the standard of English professional sculling, but the period since 1880 has been one of remarkable prosperity in the amateur world. Efforts have been made not only in England but also in the British colonies, in the United States of America, and in several countries on the continent of Europe, to keep amateur rowing pure and free from the taint of professionalism, and these efforts have on the whole met with considerable success. Nearly all the minor regattas in England are now held under the rules of the Amateur Rowing Association, and even the stewards of Henley Regatta hold their regatta "in accordance with" the rules of that body. The exact effect of the distinction is not obvious, but—such as it is—it is probably due to the fact that should any difference of opinion arise between these bodies, the committee of the Amateur Rowing Association (founded in 1876) are hardly in a position to dictate to the stewards of Henley Regatta (founded in 1839).

The Amateur Rowing Association exists for the following objects:—(1) To maintain the standard of amateur rowing as recognized by the Universities and principal boat clubs of the United Kingdom. (2) To promote the interests of boat-racing generally. It consists of clubs which adopt the following definition of an amateur, namely:—No person shall be considered an amateur oarsman, sculler, or coxswain (1) who has ever rowed or steered in any race for a stake, money, or entrance fee; (2) who has ever knowingly rowed or steered with or against a professional for any prize; (3) who has ever taught, pursued, or assisted in the practice of athletic exercises of any kind for profit; (4) who has ever been employed in or about boats, or in manual labour, for money or wages; (5) who is or has been by trade or employment for wages a mechanic, artisan, or labourer, or engaged in any menial duty; (6) who is disqualified as an amateur in any other branch of sport. Any amateur club willing to bind itself to observe the rules of the association may become affiliated, subject to election by the committee, and all the amateur clubs of any importance in the United Kingdom are members. The government and management of the Amateur Rowing Association (or A.R.A., as it is usually designated) is vested in a committee of twenty-five, who have power to affiliate clubs, appoint officers, make or alter rules, suspend, disqualify, and reinstate amateurs, and generally determine all questions and disputes relating to boat-racing which may be referred to them. The principal amateur regattas and boat-races have been held in accordance with the "Rules for Regattas" and "Laws of Boat-Racing" drawn up by this body. They are of the greatest assistance to the stewards or committees of small regattas, as the local officials might often be unwilling to inquire too closely into the amateur status of visiting crews, or to enforce the laws of boat-racing too strictly, had they not bound themselves, when they accepted the entrance fees and offered prizes, to hold their regattas "under the rules of the A.R.A."

Two important changes have been made in the Henley Regatta course. Before 1886 the races started at the upper end of the Temple Island and finished at Henley Bridge. This course was practically straight for three-quarters of the distance, but at the end there was a curve which, in a close race, gave a distinct advantage to the boat which rowed from the Berkshire side. In 1886 a new course was instituted, starting at the lower end of the island and finishing at the upper end of the wall of Phyllis Court lawn. This course is of the same length as the old one, namely, 1 mile 550 yards, but, although it has two slight angles in favour of the Buckinghamshire station, it is to all intents and purposes straight. The course is marked out on either side by a line of piles driven into the river-bed. Between 1886 and 1899 some minor alterations were made in the course. In 1888 it was narrowed to 120 feet, and in 1897 it was brought farther over to the Berkshire side, in order to diminish the advantage given to the Buckinghamshire boat in a westerly wind by the shelter of the trees upon that bank. Between 1889 and 1899 the number of spectators continued to increase, and there were frequent instances of races being interfered with by craft which were forced out on to the course by the crush of boats; and consequently, in 1899, the regatta stewards resolved to place floating booms between the piles along the greater portion of the Buckinghamshire side of the course, and along the last part of the Berkshire side. This proposal to boom off the course was very severely criticized, but the stewards had the courage of their opinions, and carried it into effect. It proved to be a great advantage not only to the competitors, who thus have a clear course, but also to the spectators, who are able to take their ease and watch the rowing without fear of being pushed out on to the course during the progress of the races. These and many other minor improvements

were instituted on the initiative and under the personal supervision of Mr Herbert T. Steward, for many years chairman of the managing committee of the regatta stewards, and it is not too much to say that the continued success of the meeting was to a great extent due to the enthusiastic and practical interest which he took in its welfare.

Another noticeable modern feature of the Henley Regatta has been the increase of foreign competition. Twice have the British colours been lowered in the Diamond Sculls. In 1892 these sculls were won by Mr J. J. K. Ooms, a Dutch sculler of considerable power and undoubted pace; and in 1897 the winner was Mr E. H. Ten Eyck, the son of an American professional sculler. This oarsman sent in his entry again in 1898, but it was refused by the stewards. In the principal rowing events Englishmen have held their own. In 1895 a Canadian crew were beaten by two feet only for the Stewards' Cup, but on few other occasions, if any, have the home crews been really hard pressed by any of the Canadian, American, French, Dutch, or German crews who have competed. A Dutch crew, the Nereus Boating Club (Amsterdam University), won the Thames Challenge Cup in 1895, but this is not considered a first-class event. In 1901 a very strong crew from the University of Pennsylvania, U.S.A., competed for the Grand Challenge Cup, and were beaten after a good race by Leander Club in the final heat. The former crew had practised together for nearly a year, while business and other engagements prevented the Leander men from getting a crew together till within a fortnight of the regatta. An outcry was raised in the newspapers against the unfairness of subjecting English crews, who with true amateur spirit treated rowing as a pastime, to competition with foreign crews who, although they obeyed the letter of the amateur definition, really made a business of their rowing. A motion was proposed at the October meeting of the Henley Stewards to exclude foreign crews from the regatta, but it was defeated by a large majority. On July 21, 22, and 23, 1902, a regatta for eights, organized by Lord O'Brien on the river Lee near Cork, Ireland, over a two-mile course, attained the character of an international meeting, by reason of the entry, at the instance of the German Emperor, of a strong Berlin eight. The final heat, in which this crew met Leander, afforded a fine exhibition of the different styles of British and Continental rowing; and the result, a victory for Leander by one and a quarter length clear, was in accordance with general anticipations. In order to allow the stewards to make proper inquiry into the amateur status and elegibility of foreign competitors, they have as a rule to make their entries prior to the 1st of April; but members of any club affiliated to the Union des Sociétés Françaises de Sports Athlétiques, or to the Fédération Belge des Sociétés d'Aviron, or of the Deutscher Ruder Verband, or of the Verbouden Nederlandsche Roeivereenigingen, may make their entries on or before the 1st of June.

Speaking generally, the high standard of English rowing was well maintained during the closing period of the century. The ideal style aimed at is much the same as it was at the beginning of the 'eighties, and very few coaches would now find fault with the directions for rowing laid down in the ninth edition of this work. The doctrine that the extra length of reach given by the sliding seat is to be used in addition to the long body-swing of fixed-seat rowing, and not in substitution for it, has long been preached by theorists, but it was not until some ten or fifteen years after the introduction of the sliding seat that oarsmen really learned to put it into practice. On a fixed seat the muscles of the legs do a certain amount of work, while the bulk of it falls on the muscles of the back: the sliding seat allows the muscles of the legs to be used to the fullest extent; and the primary object of a coach should be to get the correct combination of these two sets of muscles in every member of his crew. A man who has got over this difficulty and uses his slide and swing simultaneously from the moment that his blade enters the water until the moment that it leaves it is said to "slide well," and a crew which slides well but has many minor faults will in most cases travel faster than a crew which slides badly, even although the latter has got rid of nearly all the minor faults in style, and has the greater polish and more taking appearance of the two.

The art of coaching has made a distinct advance, and those who superintend the training of crews appear to make a more minute study than they did formerly, not only of the faults of a crew, but also of the best methods of pointing out those faults to their pupils, and of assisting them to effect a remedy. There have been, of course, from the earliest days a few coaches who thoroughly understood this art—for it is an art—but it is in the instructions given to college crews at the Universities and to junior crews of the metropolitan clubs that this improvement is most noticeable, although it must be admitted that the latter class do not seem to have benefited very much by the advice they have received. The value of good coaching to a crew cannot be over-estimated, for even the best oarsmen are apt unconsciously to develop faults in style, which grow upon them unless they are at once eradicated.

In 1901 Dr Warre, the headmaster of Eton, designed a boat for the Oxford crew, which was considerably shorter and broader than those generally used. She carried the crew for whom she was designed to victory, but she did not meet with universal approval. She was used again (in 1902) by a crew for whom she was much too small. With this exception, there has not been any substantial change in the lines or construction of the hulls of racing-boats. Some of our best scullers set their faith on boats of a short and broad build, but it is doubtful if they will ever entirely supersede the long narrow craft which have been in vogue since keel-less boats were first introduced. Many new internal fittings have, however, appeared from time to time. Some of them have stayed, and others have vanished as suddenly as they appeared. Sliding seats running upon "rollers" (small vulcanite wheels) have permanently superseded those which moved backwards and forwards upon oiled steel runners. Outriggers are made of tubular steel, which is at once lighter and more rigid than the old-fashioned solid metal. Swivel rowlocks are sometimes used in pair-oars and four-oars, but they are considered unsuitable to eight-oared rowing, where the beginning of the stroke has to be firmly and smartly caught.

The only universal change in the pattern of oars has been the introduction of Messrs Ayling's patent button, by which the risk of breakage at that point has been reduced to a minimum. Formerly the leather button where the oar rests in the rowlock was attached by two long nails driven into the wood, and there were many instances of the oar giving way at that point under the strain of a race. The patent button is fixed by screws to a metal plate, which is placed flush with the oar and kept in place by a tight covering of leather, and this covering is attached to the oar by two rows of small tacks, which do not penetrate more than an eighth of an inch into the wood. Since these buttons have been in use there has been no instance of an oar being broken at the button by fair rowing in any of the more important races.

The literature of rowing has been increased by three works which deal in detail with the arts of rowing, sculling, steering, and training, the measurements of boats and oars, and the history of boat-

racing since the inception of the sport; these are the volume on *Rowing* in the Isthmian Library series, the volume on *Rowing and Punting* in the Badminton Library series published by Messrs Longmans, Green, & Co., and *Oxford Rowing*, by the Rev. W. E. Sherwood. (C. M. P.)

United States.—Rowing is one of the oldest of well-defined sports in America, having been taken up in the colleges about 1840. In 1852 the first race between Yale and Harvard was rowed at Lake Winipiseogee. For a time the races were rowed in all sorts of crafts and under all kinds of rig—four-oar, six-oar, eight-oar, barges, lap streaks, &c. But after a while the universities settled down to six-oared shell racing, and later to eight-oared. The National Rowing Association of American colleges was formed in 1872, and regattas were held at Springfield on the Connecticut river. Afterwards Saratoga offered greater inducements, and the lake there was adopted. In 1875 thirteen colleges sent crews to the races at this meeting; but the organization was apparently too bulky, and the loss of Yale in 1876, and of Harvard in the following year, seemed to put an end to the interest, and the association fell to pieces. Since that time Harvard and Yale have conducted a series of annual races in eight-oared shells with coxswains, held for the most part on the Thames at New London, Connecticut; but in 1896 Yale sent her crew to the Henley Regatta in England, and in the following year Harvard, Yale, and Cornell rowed in a triangular race on the Hudson river at Poughkeepsie. In the years 1897 and 1898 Mr Rudolph C. Lehmann, the English oarsman and coach, took charge of the Harvard crews, which had for some years been consistently unsuccessful; and though the crews he coached were beaten, the system and traditions thus inculcated, together with other influences, regenerated Harvard boating. A beginning was made toward a renewal of the old general inter-collegiate regatta by races upon the Hudson river near Poughkeepsie. In 1900 and 1901 the Universities of Pennsylvania, Wisconsin, Cornell, Columbia, Georgetown, and Syracuse furnished the largest and most exciting of the regattas thus far held there. While college rowing is the oldest form of well-organized boating in the United States, there has been considerable rowing, both professional and amateur, outside the colleges. Single-scull racing was the most common professional event, but there was not always perfect confidence in the genuineness of the races. The National Amateur Association from time to time held the most satisfactory meetings, and did much to keep up the interest in amateur boating. American crews have occasionally competed abroad, mainly in England. Harvard sent a crew in 1869 to row against Oxford on the Thames; Columbia in 1878, Cornell in 1881 and 1895, Yale in 1896, and Pennsylvania in 1901 competed at Henley. Single scullers were also sent. Upon the occasion of the Centennial Exposition in 1876, English crews competed on the Schuylkill. Many attempts to arrange for other English crews, especially university crews, to visit America were unsuccessful. (W. CA.)

Rowland, Henry Augustus (1848–1901), American physicist, was born at Honesdale, Pennyslvania, on 27th November 1848. Although from an early age he exhibited marked scientific tastes and spent all his spare time in electrical and chemical experiments, it was not until he was sixteen that he was allowed to abandon the classical studies which were so distasteful to him and devote himself to scientific and mechanical pursuits. Entering the Rensselaer Polytechnic Institute at Troy, N.Y., he followed the usual engineering curriculum of the place, and graduating in 1870, soon obtained an engagement on the Western New York Railway. But the work there was not to his liking, and after a short time he gave it up for an instructorship in natural science at Wooster College, Ohio, which in turn he resigned in order to return to Troy as assistant professor of physics. Finally, in 1876, he became the first occupant of the chair of physics at the Johns Hopkins University, Baltimore, a position which he retained until his premature death on 16th April 1901. Rowland was one of the most brilliant men of science that America has produced, and must be assigned a high rank among the experimental physicists of the 19th century. It is curious that at first his merits were not perceived in his own country, and his early work, treated there with indifference, first won adequate recognition in the Eastern hemisphere. In America he was unable even to secure the publication of certain of his scientific papers; but Clerk Maxwell, when they were submitted for his consideration, at once saw their excellence, and had them printed in the *Philosophical Magazine*. So much impressed, indeed, were European physicists by his merits, that when the managers of the Johns Hopkins University asked advice in Europe as to whom they should make their professor of physics, he was pointed out in all quarters as the best man for the post, and was accordingly chosen. In the interval between his election and the assumption of his duties at Baltimore, he studied physics under Helmholtz at Berlin, and carried out a well-known research on the effect of an electrically charged body in motion, showing it to give rise to a magnetic field. His conclusions were subsequently disputed, but he reassured himself of their accuracy by a repetition of the experiments only a short time before his death. As soon as he was settled at Baltimore, two important pieces of work engaged his attention. One was a redetermination of the ohm. For this he obtained a value which was substantially different from that ascertained by the committee of the British Association appointed for the purpose, but ultimately he had the satisfaction of seeing his own result accepted as the more correct of the two. The other was a new determination of the mechanical equivalent of heat. In this he used Joule's paddle-wheel method, though with many improvements, the whole apparatus being on a larger scale and the experiments being conducted over a wider range of temperature. He obtained a result distinctly higher than Joule's final figure; and in addition he made many valuable observations on thermometrical questions and on the variation of the specific heat of water, which Joule had assumed to be the same at all temperatures. In 1882, before the Physical Society of London, he gave a description of the diffraction gratings with which his name is specially associated, and which have been of enormous advantage to astronomical spectroscopy. These gratings consist of pieces of metal or glass ruled by means of a diamond point with a very large number of parallel lines, on the extreme accuracy of which their efficiency depends. For their production, therefore, dividing engines of extraordinary trueness and delicacy must be employed, and in the construction of such machines Rowland's engineering skill brought him conspicuous success. Some account of the minute precautions and refinements observed for the elimination of error to the greatest possible extent may be found in the ninth edition of this Encyclopædia in the article SCREWS, which came from his pen, as also did DIFFRACTION GRATINGS in vol. xxvii. In addition to making gratings, Rowland also used them, and the results of his labours may be found in the elaborate *Photographic Map of the Normal Solar Spectrum* (1888) and the *Table of Solar Wave-Lengths* (1898). In the later years of his life he was engaged in developing a system of multiplex telegraphy, an account of which is given in the article TELEGRAPHY. (H. M. R.)

Roxburgh, an inland border county of Scotland, is bounded on the E. and S.E. by Northumberland, on the S.E. by Cumberland, on the S.W. by Dumfries, on the W. by Selkirk, on the N.W. by Midlothian, and on the N.E. by Berwick. It occupies the greater part of the border line between England and Scotland.

Area and Population.—In 1891 the parishes of Ashkirk, Galashiels, and Selkirk, which were shared between Roxburgh and Selkirk shires, were placed wholly in Selkirk, and the Selkirk part of the parish of Melrose was transferred to the parish of Galashiels. Of parishes divided between Berwick and Roxburgh, Earlston and Mertoun were restricted to Berwick, part of Lauder was transferred to Roxburgh, and Roberton was placed wholly in Roxburgh. According to the official estimate, the area of the county is 428,527 acres, or nearly 670 square miles. The population was, in 1881, 53,442; in 1891, 53,741; in 1891 on the above area, 53,500, of whom 24,901 were males and 28,599 females; in 1901 it was 48,793. On the old area, taking land only (425,656 acres, or 665·1 square miles), the number of persons to the square mile in 1901 was 73, and the number of acres to the person 8·7. In the registration county the population increased between 1881 and 1891 by 5·9 per cent. Between 1881 and 1891 the excess of births over deaths was 5936, and the increase of the resident population 312. The following table gives particulars of births, deaths, and marriages in 1880, 1890, and 1899:—

Year.	Deaths.	Marriages.	Births.	Percentage of Illegitimate.
1880	838	297	1623	11·0
1890	876	246	1343	10·27
1899	773	282	1054	9·9

The following table gives the birth-rate, death-rate, and marriage-rate per thousand of the population for a series of years:—

	1880.	1881–90.	1890.	1891–98.	1899.
Birth-rate . .	31·06	28·42	25·37	22·19	19·67
Death-rate . .	16·04	17·18	16·55	15·78	14·42
Marriage-rate .	5·68	4·84	4·64	5·02	5·26

There were 174 Gaelic-speaking persons in the county in 1891, and 43 foreigners. Valuation in 1889–90, £366,056; 1899–1900, £384,459.

Administration.—The county returns a member to Parliament, and contains Hawick (17,303), one of the Border group of parliamentary burghs and a police burgh. Jedburgh (2222), the county town, is the only royal burgh, and Kelso (4006) is the only considerable police burgh. There are 30 civil parishes, with combination poorhouses at Hawick, Jedburgh, and Kelso; and the lunatic asylum for Roxburgh, Berwick, and Selkirk is at Bowden, near Melrose. The number of paupers and dependants in September 1899 was 963. Roxburgh, Berwick, and Selkirk form a sheriffdom, and a resident sheriff-substitute sits at Jedburgh and Hawick.

Education.—Thirty-two school boards manage 63 schools, which had an average attendance of 7269 in 1898–99, while 5 voluntary schools (1 Roman Catholic and 2 Episcopal) had 563. There are secondary schools at Hawick and Kelso, and Jedburgh and Melrose public schools have secondary departments. The greater part of the "residue" grant is spent in assisting teachers to attend science and technical classes at Edinburgh University and Hawick, and in subsidizing science and art and technical classes at Hawick, Kelso, and elsewhere.

Agriculture.—Oats are the principal corn crop, and the barley acreage is about two-fifths of that under oats. The percentage of cultivated area in 1898 was 41·9. There were 16,285 acres under wood in 1895, of which 757 had been planted since 1881. Of the 1241 holdings in 1895, the date of the last return, the average size was 146 acres. The percentage under 5 acres was 21·76, between 5 and 50 acres 33·44, and over 50 acres 44·80. The number of farms between 50 and 100 acres was 100, between 100 and 300, 253, between 300 and 500, 102, and between 500 and 1000, 85, while as many as 16, a proportion exceeded in Berwickshire only, were over 1000 acres. The following table gives the principal acreages at intervals of five years from 1880:—

Year.	Area under Crops.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1885	184,322	48,303	27,423	57,682	50,845	69
1890	185,726	46,792	27,183	58,270	53,379	56
1895	180,962	43,380	25,312	56,745	55,408	47
1899	182,337	42,966	24,379	52,650	62,236	58

The following table gives particulars of the live stock during the same years:—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or Calf.	Sheep.	Pigs.
1885	4396	18,679	5373	494,152	4174
1890	4394	18,576	5179	517,629	4286
1895	4462	17,327	4684	510,227	3938
1899	4300	17,787	4560	532,989	3260

At the census of 1891, 4895 men and 1106 women were returned as being engaged in agriculture.

Industries and Trade.—The county is the principal seat of the tweed and hosiery manufacture in the kingdom. The industries of Hawick and Jedburgh include also engineering, iron-founding, and dyeing, and fishing tackle is made on a considerable scale at Kelso. The salmon fishings on the Tweed are valuable. The industrial population in 1891 numbered 8102 men and 4445 women, of whom 2385 men and 2523 women were connected with the manufacture of textiles.

Royan, town, arrondissement of Marennes, department of Charente Inférieure, France, 37 miles in direct line, south of Rochelle, on branch line from Pons to Tremblade. A municipal casino was opened in 1895. A statue of Eugène Pelletan (died 1884), a benefactor of the town, has been erected. Royan is the seat of a Protestant consistory. There is an active coasting trade. In 1900, 1064 vessels of 65,760 tons entered, and 1038 of 65,064 tons cleared. Population (1891), 6241; (1896), 6864 (comm.), 8258.

Rózsahegy, a market-town of Hungary, in the county of Liptó, near the Vág, with 6879 inhabitants in 1891. It has an upper gymnasium, textile manufactories, paper mill, saw mill, and other industrial establishments. Its commerce is brisk. Not far from Rózsahegy lies Koritnicza, a popular bathing-place. Population (1901), 8198.

Ruabon, a parish, town, and railway station, Denbighshire, North Wales, in the Eastern parliamentary division, near the Shropshire border, 5 miles south-west of Wrexham. In the neighbourhood there are collieries, engineering works, an iron foundry and chemical works, and an extensive industry in the manufacture of bricks, terra-cotta, encaustic and tesselated tiles, glazed bricks, and sanitary pipes. Population of civil parish (1901), 3491.

Rubinstein, Anton Grigorowitz (1830–1894), Russian pianist, born at Wechwotynetz, in Podolia, of Jewish parentage, was the son of a pencil manufacturer who migrated to Moscow. Besides his mother he had but one teacher, Alexander Villoing, of whom he declared at the end of his own career that he had never met a better. In July 1839 Rubinstein appeared in the theatre of the Petrowski Park at Moscow, and was promptly acclaimed a genius; and in the year following he went to Paris after Villoing, and played with success before Liszt. For some time after this Rubinstein travelled in Holland, Germany, and Scandinavia, and reached England in 1842, where on 20th May he made his first appearance at a Choral

Fund Concert with complete success. After a brief visit to Moscow in 1843, he went with his family (including his afterwards distinguished brother Nikolaus) to Berlin for purposes of the complete musical education which the parents had now determined to give their sons. Dehn was their master, and Mendelssohn, whom Rubinstein had met previously in London, their best friend. The sudden death of Rubinstein *père* necessitated the withdrawal of his wife and Nikolaus to Moscow, while Anton, on Dehn's advice, went to Vienna to seek a livelihood. Hence, after more hard study for nearly two years, he went with the flautist Heindl, and later alone, on a concert tour in Hungary; and the outbreak of the revolution in Vienna preventing his return there, he went *viâ* Berlin to St Petersburg, where he met with immediate and hearty encouragement, the Grand Duchess Hélène appointing him Kammervirtuos. About this time an unfortunate error of the police nearly caused his expatriation to Siberia, from which he was saved by his patroness. During the next eight years Rubinstein spent most of his time in St Petersburg studying, playing, and composing. His opera *Dmitri Donskoi* was produced there in 1851, and *Toms der Narr* in 1853. *Die Sibirischen Jäger*, written about the same time, was not produced. In Russia his success was so great, and his fame had already spread so far abroad, that on the advice of his patroness and Count Wilhorski he set out on a tour to convince foreigners of his abilities. After a visit to Hamburg, he appeared as composer, conductor, and pianist at the Gewandhaus at Leipzig, and after further travels he arrived for the second time in London in 1857, when at a Philharmonic Concert he introduced his own concerto in G. In the following year he was in London again, having in the meantime been appointed Concert Director of the Royal Russian Musical Society. In 1862 he founded the St Petersburg Conservatorium, of which for many years he remained the guiding spirit. In 1868 he began again to travel in Germany, France, and England, and remained for some time in Vienna, where he introduced a large number of his own compositions. Thence he went to America in 1872 and 1873, when he returned to Russia, and after a short rest set off once more on concert tours. In this manner the rest of his life was spent, until in 1885 he began a series of historical recitals of immense interest, which he gave in most of the chief European capitals. He died 20th November 1894.

In addition to the works already named, Rubinstein left compositions in almost every known form. Among other of his operas are *Die Kinder der Haide*, *Feramors* (*Lalla Roukh*), *Nero*, *Der Dämon*, and *Die Makkabäer*, this last perhaps more frequently played than all the others, the bane of which is the lack of dramatic point. On the subject of oratorio Rubinstein held original views, though his attempt to realize them in *Moses* and *Christus* was not completely successful, while his efforts in Berlin and London to found a Sacred Theatre failed entirely. All the same, he regarded his *Christus* as his greatest achievement. The most familiar of his five symphonies are the "Ocean" and the "Dramatic." He wrote scores on scores of pianoforte works, from complex concertos to the most commonplace *salonstücke*; abundance of concerted chamber-music; and a number of songs and duets, which enjoyed some vogue. He also published several books, including his Reminiscences and *Die geistliche Oper*. What Dr Hanslick once said of Rubinstein is perfectly true, that "people admired the Russian's bold, powerful, occasionally even rough playing, without being won over in the least by his compositions." As a composer Rubinstein is practically dead. His fame as one of the greatest of pianists, his exquisite touch and perhaps his waywardness, will live in history.

(R. H. L.)

Ruby Mines, a district in the Mandalay division of Upper Burma, lying between the Bhamo district on the north, the Shan States on the east, Mandalay district on the south, and Kalta on the west. Area, 1915 square miles; population (1891), 34,062; (1901), 87,815. In 1898–99 it had 193 villages, which paid a revenue of Rs.1,09,649. The district geographically forms part of the Shan plateau, and is to a great extent a mass of hills, with a general north and south direction. Of a total acreage of 3,504,480 acres, only 7347 were cropped in 1898–99. There were 2980 acres of current fallow, and the area remaining available for cultivation was 349,661 acres; 118,296 acres were under forest, and the remainder, 747,068 acres, were uncultivable. The population in 1891 was classified as: Buddhists, 31,227; Hindus, 884; Mahommedans, 350; and Christians, 269. Kachins and Palaungs together probably outnumbered the Burmans and Shans, but there were no exact statistics. The total rainfall in 1898–99 was 103·26 inches, taken at Mogôk. The highest shade maximum in that year was 83°, and the lowest temperature in December, 35° F. The headquarters town is Mogôk, which is reached by a cart-road from Thabeikkyin, 61 miles distant, on the Irrawaddy. The town stands in the centre of a valley, at a height of 4000 feet above sea-level. It is the centre of the ruby-mining industry. Population (1891), 5630; (1898), about 8000. The Ruby Mines Company employs about 40 Europeans and Eurasians in its works, which are situated at the north end of the town. The company has constructed a dam across the Yeni stream and set up an electric installation of about 200 horse-power, which pumps and lights the principal mine.

Rüdesheim, a town of Prussia, in the Rhine province, on the right bank of the Rhine, 19 miles by rail west by south of Wiesbaden, famous for its wine. It has three ancient towers, and an Evangelical (1855) and a Roman Catholic (1390–1400) church. Immediately above the town, on the Niederwald hill (985 feet), stands the national monument ("Germania"), designed by Schilling, commemorative of the war of 1870–71. Population (1900), 4812.

Rudini, Antonio Starabba, Marquis di (1839——), Italian statesman and Knight of the Annunziata, was born on 6th April 1839 at Palermo. In 1866 he was elected syndic of his native city, and displayed considerable personal courage in quelling a separatist insurrection organized by the reactionary party. The prestige thus acquired led to his appointment to the prefecture of Naples in 1867, and in October 1869 to the Ministry of the Interior in the Menabrea cabinet. His term of office was short, as he fell with Menabrea in the following December, and held no prominent position until, upon the death of Minghetti in 1886, he became leader of the Right. Early in 1891 he succeeded his fellow-Sicilian, Crispi, in the premiership and Ministry of Foreign Affairs by forming a coalition cabinet with a part of the Left under Nicotera; but his administration proved weak and vacillating, its only important act being the renewal of the Triple Alliance for a period of twelve years. After an attempt to modify his cabinet, he was overthrown in May 1892 by a vote of the Chamber. Upon the return of his rival, Crispi, to power in December 1893, he resumed political activity, allying himself with the Radical leader, Cavallotti, whose defamatory anti-Crispian campaign he openly encouraged. The crisis consequent upon the disaster of Adowah (1st March 1896) enabled Rudini to return to power as Premier and Minister of the Interior in a cabinet formed by the veteran Conservative, General Ricotti. He concluded peace with Abyssinia, but

endangered relations with Great Britain by the unauthorized publication of secret diplomatic correspondence in a Green-book on Abyssinian affairs. His internal policy was marked by continual yielding to Radical pressure and by persecution of Crispi. Dissolving the Chamber early in 1897 in obedience to Radical dictation, and supporting Radical candidatures in the ensuing general election, he augmented the influence of the subversive parties, and inadvertently paved the way for the outbreak of May 1898, the suppression of which, *manu militari*, entailed considerable bloodshed and necessitated the proclamation of a state of siege at Milan, Naples, Florence, and Leghorn. Indignation at the results of his policy led to his overthrow in June 1898, when, in order to prevent the advent of his Conservative opponents, he resigned office without permitting Parliament to designate a successor. During his second term of office he thrice modified his cabinet (July 1896, December 1897, May 1898) without strengthening his political position. In many respects Rudini, though leader of the Right and nominally a Conservative politician, proved a dissolving element in the Italian Conservative ranks. By his alliance with the Liberals under Nicotera in 1891, and by his understanding with the Radicals under Cavallotti in 1894–98; by his betrayal of his Conservative colleague, General Ricotti, to whom he owed the premiership in 1896; and by his vacillating action since his fall from power, he divided and demoralized a constitutional party which, with greater sincerity and less reliance upon political cleverness, he might have welded into a solid parliamentary organization.

Rudok. See TIBET.

Rudolf (otherwise known as BASSO NOROK and GALLOP), a large lake of eastern equatorial Africa, forming the centre of an inland drainage system, occupying the southern part of the Abyssinian highlands and a portion of the great equatorial plateau. The lake itself lies towards the north end of the great East African rift valley, between the parallels of 2° 26′ and 5° N., while the meridian of 36° E. runs down the centre of the northern wider part, the narrower southern portion bending slightly eastward. The length along the curved axis is 185 miles, the maximum width probably about 35, and the area roughly 3500 square miles. Its altitude is 1250 feet. Towards the south end it seems to be deep, but it is comparatively shallow in the north. Its water is brackish, but drinkable. The country bordering the lake on almost every side is sterile and forbidding, and the only permanent river which enters it is the Nianam or Omo, from the north. The southern end, for some 50 miles on the west and for a longer distance on the east, is shut in by high cliffs—the escarpments of a rugged lava-strewn country, which shows abundant signs of volcanic activity, great changes having been reported since 1889. In particular, the great volcano of Lubburua is said to have been destroyed between 1889 and 1897 by a sudden explosion, and according to native report the lake contours have considerably changed within 30 years. Farther north, on the west side, sandy plains alternate with lines of low hills, the immediate shores (on which the water appears to have encroached in very modern times) being marked by spits of sand, which in places cut off lagoons from the main body of the lake. These are the haunt of great numbers of water-birds. In 3° 8′ N. the dry bed of the Turkwell—in its upper course a large river descending the slopes of Mount Elgon—approaches the lake, which seems, however, to receive no water from it at the present day. Near the north end mountains again approach the shores, the most prominent being Mount Lubbur, an extinct volcano with a well-preserved crater, and a bold rocky escarpment below the summit. At the extreme north-west corner a bay some 35 miles long (Sanderson Gulf) is almost separated from the rest of the lake by two long points of land. On the eastern side, open arid plains, with few trees, occupy most of the northern country. Near the south end is the volcanic island of Elmolo, 10 miles long, and there are a few small islets near the middle point of the length. At the north end a level swampy plain is traversed by various arms of the lake and by the Nianam river. This river has been shown to be identical with the Omo, the course of which was long one of the most debated questions of African geography. Its northernmost feeders rise on the high plateau south of the Blue Nile, in 9° 10′ N., and being swollen by other streams from the east and west, soon form a large river running in a deep wooded valley flanked on either hand by masses of high mountains. During its lower course it makes two considerable bends to the west before finally entering the lake as a deep stream a quarter of a mile wide. Lake Rudolf (previously known on the east coast by report) was discovered in 1889 by Teleki, and has since been visited by Donaldson Smith, Bottego, Cavendish, Austin, and others.

(E. HE.)

Rufiji, a large river of German East Africa, entering the sea by a considerable delta, between 7° 45′ and 8° 13′ S. Its upper basin, which extends from north to south through over 300 miles, is drained by three main branches, which unite to form the lower Rufiji. This receives no further tributary in a course of some 150 miles, so that here the width of the basin is reduced to a minimum. Of the three upper branches, the two southern, the Luvegu and the Ulanga, though shorter than the northernmost (the Ruaha), carry a greater volume of water, as they come from a more rainy region, and by their junction the Rufiji proper may be said to be formed.

The Luvegu rises in 10° 50′ S., 35° 50′ E., and flows north-west in a wooded valley, generally narrow, and bordered by a broken country in great part uninhabited and covered with thin forest. In its lower course it is a large stream—100 to 150 yards wide.

The Ulanga is formed by a number of streams descending from the outer escarpment of the high plateau which runs north-east from the head of Lake Nyasa, and in Uhehe becomes broken up in ranges of mountains. The most important headstream, the Ruhudye, rises in about 9° 30′ S., 34° 40′ E. As a whole, the Ulanga valley is broad, level, and swampy, the river running in a very winding course and sending off many diverging arms. It is navigable throughout the greater part of its course, having even in the dry season a general depth of 3 to 12 feet, with a width of 40 to 120 yards. In April and May nearly all the streams overflow their banks and cover a great part of the plain.

Just below the junction of the Luvegu and Ulanga, the Rufiji flows through a narrow pass by the Shuguli falls, and continues north-east in a fairly straight course to the junction of the Ruaha, in 7° 55′ S. The most remote branches of the Ruaha rise north of Lake Nyasa in the Livingstone mountains, and descend into a broad sun-baked valley, which seems to belong to the East African system of rift valleys. The united stream makes a wide sweep to the north of the Uhehe mountains, from which it receives various tributaries, finally flowing south-east and east to the Rufiji. A little below the junction, the Rufiji is broken by the Pangani falls (37° 42′ E.), but is thence navigable by small steamers to its delta. The country on either side is a generally level plain, inundated, on the south, in the rains, and the river varies in width from 100 to 400 yards, with an average current of 3 miles an hour. The main mouth of the river is that known as Simba Uranga, the bar of which can be crossed by ocean vessels at high water, but all the branches are very shallow as the apex of the delta is approached. Saw-mills have been established on some of them, and much of the delta is suited for rice-growing.

See BEARDALL in *Proc. R.G.S.*, 1881.—PFEIL in *Petermanns Mitteilungen*, 1886.—PRITTWITZ and ADAMS in *Mitt. aus den Deutschen Schutzgebieten*, 1898.—PRÜSSING, *Ibid.*, 1901.

Rugby, a market-town and parish of Warwickshire, England, in the Rugby parliamentary division of the county, $80\frac{1}{2}$ miles north-west of London by rail. In 1895 the parish church was completed, by the addition of a tower with a spire and eight bells, at a cost of £10,000. A free public library building was presented to the town in 1891. The books were furnished by the Rugby Institute, since dissolved. In 1895 the Rev. Herbert Armitage James, D.D., late principal of Cheltenham College, succeeded the Rev. John Percival, LL.D. (late principal of Trinity College, Oxford), on his becoming bishop of Hereford, as headmaster of Rugby School. Among modern public buildings are the municipal offices, and additions to the technical schools. Population of urban district and parish (1891), 11,262; (1901), 16,830: of parliamentary division (1891), 49,737; (1901), 56,221.

Ruhla, a town and summer resort of Germany, partly in the duchy of Saxe-Weimar and partly in the duchy of Saxe-Coburg-Gotha. It stretches $2\frac{1}{2}$ miles along the valley of the Erb, in the Thuringian Forest, 8 miles south of Eisenach. Visitors are attracted by its natural surroundings, its mineral and other baths, and by its whey and cold-water "cures." It has a staple industry in the manufacture of pipes, cigarette-holders, &c., and iron wares. In the Middle Ages this place, locally known as Die Ruhl, was famous for its armourers, subsequently for its cutlers. Population (1900), 6581, of whom 3081 belonged to the Weimar part and 3500 to the Coburg-Gotha part.

Ruhrort, a town of Prussia, in the Rhine province. It stands on the Rhine, at the confluence of the Ruhr, 24 miles by rail north of Düsseldorf, and is the principal shipping port for the coal of the Westphalian coal-field, the harbour extending $4\frac{1}{2}$ miles along the river. In 1899 the port was entered and cleared by 13,951 vessels of 6,927,000 tons. Ruhrort has iron-puddling furnaces, dye-works, tanneries, and brickworks. Population (1885), 9866; (1900), 12,407.

Rukwa (sometimes also Rikwa and Hikwa), a shallow lake in German East Africa, lying in a north-western continuation of the rift valley which contains Lake Nyasa. The sides of the valley here run in steep parallel walls 30 to 40 miles apart, from south-east to north-west, leaving between them a level plain extending from about $7\frac{1}{2}°$ to $8\frac{1}{2}°$ S. This whole area was probably once covered by the lake, but this has shrunk, apparently within quite modern times, so that the permanent water occupies only a space of 30 miles by 12 at the south end immediately under the eastern escarpment. In the rains it extends some 40 miles farther north, and the north end of the plain is likewise then covered with water to a depth of about 4 feet. The rest of the plain is a bare expanse intensely heated by the sun in the dry season, and forming a tract of foul mud near the lake shores. The principal feeder of Rukwa is the Saisi, which traverses a winding valley cut out of the high plateau between Lakes Nyasa and Tanganyika. The maximum depth of the lake is about $10\frac{1}{2}$ feet. Its water is very brackish and of a milky colour, from the mud stirred up by the wind. It contains great quantities of fish. First seen from the north by Thomson in 1880, it has since been visited by many travellers, both British and German, including Johnston, Nutt, Wallace, Ramsay, Glauning, Fülleborn, and Kohlschütter.

See especially *Proc. R.G.S.*, December 1890; *Geographical Journal*, June 1899; *Mitteilungen aus den Deutschen Schutzgebieten*, 1899, No. 4; 1900, No. 1.

RUMANIA.

RUMANIA, a kingdom of the Balkan Peninsula, bounded by Russia on the north, the Danube on the south, Hungary on the west, and the Black Sea on the east (for details, see *History*, below).

Population.

The population in 1884 was 4,648,123, and in 1899, 5,912,520, this giving a density of 117 per square mile. The excess of births over deaths in the five years from 1894 to 1899 was 370,205; but the average annual excess during the last quarter of the 19th century was 43,609, which would in forty years indicate a natural increase of 1,744,360 in the population; the actual increase, however, according to the census returns, was over two millions, which would indicate that during that period some quarter of a million strangers settled in the country. Much of this increase is due to immigration of Jews from Galicia and Russia. Of the total population, 18·8 per cent. live in towns and 81·2 per cent. in the country; 50·7 per cent. are males and 49·3 per cent. females; 55 per cent. are unmarried, 38·6 per cent. married, 6·1 per cent. widows and widowers, and 0·3 per cent. divorced.

As regards nationality, there are Rumanians, 5,469,036; foreigners, 171,063; and nondescript (principally Jews), 272,241.

The following table shows the thirty-two administrative districts into which the country is divided, their respective populations in 1899, their area in square miles, and the number of inhabitants per mile. The Dobruja, which comprises the districts of Constantza and Tulcea, is less thickly populated than the rest of the country.

District.	Area in Square Miles.	Population, 1899.	Inhabitants per Square Mile.
Argesh	1,712	205,882	120
Bacau	1,533	192,963	125·9
Botoshani	1,215	170,455	140·1
Braila	1,682	147,006	89·5
Buzeu	1,877	220,439	117·5
Constantza	2,567	135,050	52·6
Covurlui (Galatz)	1,143	144,075	126
Dimbovitza	1,334	209,440	157
Dolj (Craiova)	2,532	364,193	143·8
Dorohoi	1,089	158,605	145·6
Falciu	852	93,317	109·5
Gorj	1,813	169,324	93·3
Ilfov (Bucharest)	2,231	545,706	244·6
Jalomitza	2,500	187,193	74·8
Jassy	1,205	191,828	159·1
Mehedintzi (Turn Severin)	1,910	247,223	129·4
Muscel	1,140	113,458	99·5
Neamtz (Piatra)	1,543	146,894	93·1
Olt	1,000	142,496	133
Prahova (Ploesti)	1,800	304,376	169
Putna (Focsani)	1,254	150,410	119·9
Ramnic-Sarat	1,262	136,467	108
Roman	807	108,704	134·7
Romanatzi	1,767	202,499	114·4
Suceava	1,319	129,687	98·2
Tecuciu	983	120,026	122·1
Teleorman	1,808	236,129	130·6
Tulcea	3,329	123,192	37
Tutova	923	115,786	125·4
Vaslui	884	109,356	123·7
Valcea	1,636	189,865	116
Vlashca (Giurgevo)	1,732	200,536	115·7
	50,472	5,912,520	117

The principal towns are Bucharest, with (1900) 282,071 inhabitants, of whom 43,274 are Jews; Jassy, 78,067, with 39,441 Jews; Galatz, 62,678, including 13,970 Jews; Braila, 58,392, with 10,811 Jews; Craiova, 45,438; Ploesti, 42,687; and Botosani, 32,193, of whom 16,660 are Jews.

Constitution and government.

The government of Rumania is a hereditary and constitutional monarchy. The constitution of 1866 was modified in 1879 and 1884. All citizens of full age, paying taxes, are divided into three electoral colleges, classed according to wealth, position, and education. The first and second colleges, and in the third college those who can read and write and have an income of £12 from land, vote directly, as also do the village priests and schoolmasters; but the residue of the third college vote indirectly, *i.e.*, every fifty indirect electors select a delegate, who votes along with the direct electors. The Senate is elected by the first two colleges only. The Senate, consisting of 120 members elected for eight years, includes the heir-apparent, eight bishops, and four members elected by the universities of Jassy and Bucharest. The Chamber of Deputies consists of 183 members, elected for four years. Both senators and deputies must possess certain qualifications, and are paid. The executive is vested in a council of eight ministers, the president of which is Prime Minister. The penalty of death has been abolished, except for military offences in time of war.

The Julian calendar is used in Rumania, which, since the year 1900, is 13 days behind the Gregorian, which latter is employed in the railways and in the administration of posts and telegraphs.

Administration.

For administrative purposes the country is divided into 32 districts (see *Population*), of which Wallachia contributes 17, Moldavia 13, and the Dobruja 2. Each district (*judete*) has at its head a prefect, who is assisted by an elected council. The districts are divided into subdistricts (*plasi*), administered by subprefects, and each of these contains a certain number of communes, governed by a communal council, who elect their mayor, subject to confirmation by the Government. There are mayors and municipalities in all the large towns, and very heavy *octroi* duties, which provide the means for municipal administration. Rumania is one of the most bureaucratic countries in the world, and spends annually half a million sterling, or more than one-fourth of its entire budget, on the *personnel* of the public services, exclusive of the army and the employés of the State railways.

Justice and crime.

The judicial department is entirely independent of the executive, and the judges are irremovable. The judicial hierarchy comprises, first, a High Court of Appeal (*cour de cassation*), at Bucharest; four Courts of Appeal, at Bucharest, Craiova, Galatz, and Jassy; courts of first instance in each district; subdistrict tribunals (justices of the peace); and communal tribunals, composed of the mayor and two assessors, who have jurisdiction in minor cases. There are also commercial tribunals in the large towns. Legislation is based on the Code Napoléon, and in all criminal cases the judges are assisted by a jury. On the whole, justice works well, although sometimes very dilatorily.

Crime is apparently on the decrease. In 1893 there were 4693 persons imprisoned for various misdemeanours, whilst in 1897 there were only 2573 admissions. The average number for the last thirty years of the 19th century was 3964. Out of a total of 40,249 prisoners that passed through the prisons during the last five years of that period, no less than 14,343 were sentenced for murder and murderous assaults. Of these prisoners, only 18,055 knew how to read; of 70,702 prisoners in the ordinary gaols, 13½ per cent. were illiterate. In addition to the ordinary prison institutions of civilized countries, there are workshops in the central prisons, where the men receive payment for their labour, of which, however, the State takes a percentage.

Religion.

As regards religion, the population of Rumania is divided (1900) as follows: Orthodox (Greek), 5,408,743; Catholics and Protestants, 168,276; Mahommedans, 43,470; Armenians, 6598; Jews, 269,015; others, 16,148. The Catholics are principally found in Bucharest and in the districts of Roman and Bacau; the Mahommedans almost exclusively in the Dobruja; and the Jews in Bucharest, Braila, Galatz, Jassy, and the districts of northern Moldavia. It is estimated that the Protestants number about 13,000. The Zingari or Gypsies, who formerly numbered about 200,000, are now mostly incorporated in the Orthodox community.

The number of Orthodox churches in Rumania is 6787, of which 218 are kept up by the State, 5909 by the communes, and 660 by private individuals and pious foundations. The Roman Catholics have two bishops, 63 churches, and 80 priests; the Protestants, 12 churches and 19 clergymen; the Armenians, 16 churches; the Jews, 305 synagogues; and the Mahommedans, 260 mosques.

The Rumanian Church is autocephalous, but holds the same dogmas as the Orthodox Greek Church. It is administered by a Holy Synod, composed of the bishops of the eight dioceses. Its president is the archbishop and metropolitan of Hungary-Wallachia, primate of Rumania; the other members are the archbishop and metropolitan of Moldavia (resident at Jassy), the bishops of Ramnicu-Valcea, of Roman, Buzeu, Husi, Curtea d'Argesh, and the Lower Danube (Galatz). There are also eight bishops *in partibus*, coadjutors of the above. The metropolitans and bishops are elected by the Senate and Chamber of Deputies sitting together *ad hoc*; the former must be selected from the bishops, and the latter from the bishops *in partibus*. These, in their turn, are selected by the Minister of Public Worship from lists prepared by the Synod. The clergy are divided into two classes, the "Kalugari" or monks, and the secular clergy, who marry before taking orders. The Kalugari only are eligible for the higher dignities of the Church. Monasteries abound. There are no less than 168 scattered throughout the country, principally in the mountainous districts, which shelter 1429 monks and 2709 sisters. Many monasteries have, however, ceased to be inhabited, and have become, since the confiscation of their property (owing to flagrant abuses) in 1864, simple churches, institutions, or even prisons. The monasteries of Moldavia and Wallachia differ materially from those of western Europe. They are, generally speaking, perched in inaccessible places and strongly fortified, and served in troublous times as harbours of refuge to the inhabitants, or as rallying points to demoralized troops. The property held by the monasteries prior to 1864 amounted to more than six million acres, the greater part of which has been utilized in the formation of a peasant proprietary (see *History*).

Education.

Primary education is compulsory and free from the age of 7 to 11, but only 17·3 per cent. of the population can read and write. In the urban districts, indeed, the proportion is 42 per cent., but in the rural it sinks as low as 11·5 per cent. Secondary education is provided for in the lycées and gymnasiums for boys, and in the secondary day-schools for girls, and higher education at the universities. Both secondary and higher education are given gratuitously. In 1900 for primary rural education there were 22 boys' schools, 22 girls' schools, and 3213 mixed schools, with 3261 masters and 817 mistresses, educating 220,410 scholars, of whom 185,094 were boys and 35,316 girls. These establishments cost the State about £200,000 per annum. For primary urban education there were 386 schools, with 605 masters and 728 mistresses, educating 46,834 boys and 31,029 girls, at a cost of about £170,000 per annum. The institutions for secondary education are shown below:—

Male.

	Professors.	Scholars.
13 Classical lycées	477	7322
19 ,, gymnasiums	356	4594
11 Real lycées and gymnasiums	190	1887
5 Clergy schools	95	644
7 Normal schools	124	680
	1242	15,127

Female.

	Professors.	Scholars.
16 Professional schools	140	1429
9 Secondary day-schools	155	1733
3 Normal schools	107	680
	402	3842

To the above figures should be added 1623 boys and 1952 girls who follow the secondary course of instruction in private institutions. The total cost of secondary education is about £240,000 per annum. There are also commercial schools, schools of arts and crafts, and a school of agriculture intended for preparation for university studies.

For higher education there are two universities, one at Bucharest (founded in 1864) and the other at Jassy, each having faculties of literature and philosophy, law, science, and medicine; at Bucharest there are, besides, faculties of theology and pharmacy. The University of Bucharest has 90 professors and 2141 students, of whom 79 are women. At Jassy there are 60 professors to 423 students.

The budget of the Minister of Public Instruction, which tripled during the period 1870–1900, amounted for 1902–03 to a fraction under one million sterling, or nearly one-eighth part of the total expenditure of the country. Of this sum £8000 only is covered by students' fees (for board). The higher education, however, has produced what has been aptly termed a "prolétariat intellectuel," containing hosts of candidates for official employment, and has formed "anarchical, demagogic, and revolutionary elements," which have been of no profit to the country. It is seriously proposed, while continuing to give free education in the primary schools, that pupils attending the secondary schools and the universities should pay at least some portion of the cost of their instruction, as is the case in other countries.

Finance.

The public debt, incurred between 1864 and 1900, amounted on the 1st April 1901 to £57,957,652. Almost the whole of the public debt has been contracted abroad, mostly in Germany. It is calculated that half the existing debt will be redeemed by 1930, but it may be noted that the interest on the debt has increased by nearly 1 million sterling since 1894. Although this debt is very large in comparison with the resources of the country, none of it is due, as in so many other countries, to actual war. Preparations for war and for national defence have, however, absorbed in all £10,640,000 of the public debt; some 6½ millions has gone to making good budget deficits, and smaller sums have been spent on various public objects other than public works, it being these last which have absorbed by far the largest portion of the debt—33½ millions sterling.

The following table shows the rapid and steady increase of revenue and expenditure between 1872 and 1896, arranged for purpose of comparison in periods of five years. The State, as a result of this somewhat prodigal expenditure for so small a country, owns and itself works the entire railway system, the docks and elevators at Galatz and Braila, and a small fleet of merchant steamers. It has also the entire monopoly for the sale of tobacco, salt, playing-cards, matches, gunpowder, and cigarette paper. In an almost purely agricultural country like Rumania, a bad harvest entails an extraordinary falling off in its general revenues. This was bitterly felt in the budgets for 1899–1900 and the following year, and in 1900 the Government had to raise a fresh loan of 7 millions sterling to meet the difficulties of the situation directly occasioned by the bad harvest. One of the conditions of the loan was that no further loan should be raised for a period of five years.

Years.	Revenue.	Expenditure.
	£	£
1872–76 . . .	17,517,956	17,588,576
1877–81 . . .	24,778,500	24,490,428
1882–86 . . .	26,332,424	26,486,188
1887–91 . . .	32,603,184	31,926,734
1892–96 . . .	31,975,940	32,100,780

The debit sides of two budgets, as given below, will show the nature and increase of public expenditure in the course of the 20 years 1880–1900:—

	1880–81.	1899–1900.
	£	£
Interest on public debt .	1,869,448	3,430,299
Ministry of War . .	991,555	1,837,213
,, of Public Instruction . .	415,424	1,138,748
,, Finance . .	459,008	1,096,847
,, Interior . .	368,490	742,099
,, Public Works .	312,133	227,283
,, Justice . .	168,549	267,930
State Domains . . .	...	285,580
Foreign Office . . .	58,735	71,866
Council of Ministers . .	1,210	2,852
Totals . .	4,644,552	9,100,717

The estimated expenditure for the year 1902–03 amounted to £8,740,000, of which the largest item—£3,457,000—was required for the interest on the debt, the Ministry of War claiming £1,500,000. The estimated revenue included £2,260,000 from indirect and £1,744,000 from direct taxation, and a little over 2 millions from State monopolies. Of the receipts from direct taxation, two-fifths are produced from the land tax, and the remainder, in nearly equal proportions, from road taxes, spirit licences, taxes on professions, and a tax of 5 per cent. on all salaries. Of the receipts from indirect taxation, customs produce about three-eighths, the tax on spirits and beer a somewhat smaller sum, the remainder being made up by stamps, registration fees, and taxes on sugar, petroleum, and vineyards. Among the State monopolies, the sale of tobacco produces £1,620,000; salt, £300,000; matches, £120,000; cigarette paper, £60,000; and the river transport service, £100,000.

Army.

Conscription is in force, and the annual contingent of all recruits numbers some 36,000 men. In time of peace the army consists of four complete army corps, with headquarters at Craiova, Bucharest, Jassy, and Galatz, with an independent division in the Dobrudja, and a separate cavalry division with headquarters at Bucharest. The infantry consists of thirty-five regiments, on partly a permanent and partly a non-permanent footing, and of six battalions of chasseurs (*venatori*). The cavalry is similarly constituted to the infantry. There are six regiments of hussars (*roshiori*) and eleven territorial (*calarashi*) regiments. The artillery is divided into twelve regiments, and consists of 52 field, 8 horse, and 1 mountain batteries in time of peace; in war there are twenty additional field batteries. There are also two regiments of fortress artillery, and well-organized ammunition columns. Of engineers there are two regiments. In time of peace the permanent embodied force consists of 59,000 officers and men (in addition to an equal number of non-permanent troops, who are called out for short periods only), 11,359 horses, and 390 guns. The war footing of the active army is: infantry, 130,341 officers and men; cavalry, 14,297, with 13,044 horses; field artillery (including ammunition columns), 19,432 officers and men, 19,242 horses, and 494 guns; fortress artillery, 4000 officers and men; various (marines, engineers, pontoon train), 20,760 officers and men and 12,000 horses—total, 189,780 officers and men, 44,286 horses, and 494 guns. It is estimated that the militia should finally furnish an additional force of 100,000 men, but up to 1900 this branch of the service was not completely organized. The arrangements for mobilization are very complete, and the army is maintained in a high state of efficiency. The ordinary war budget for 1898–99 was £1,815,213, in addition to £800,000 voted for extraordinary expenditure. Rumania possesses an extensive, elaborate, and very costly system of defensive works, designed by the famous Belgian engineer General Brialmont, and completed at a cost (including armaments) of more than four millions sterling. The Sereth line, commenced in 1889, extends over a front of 45 miles, from Galatz to Focsani, and is intended to cover an army defending the country from a Russian invasion. The Bucharest fortifications (commenced 1885), consisting of 18 detached forts, with the same number of intermediate batteries, lie around the city on a circle of about 7 miles radius.

The navy is insignificant. Among the 19 small vessels, manned by 113 officers and 1993 men, are, however, 6 first-class torpedo boats.

Production and Industry: minerals.

The chief mineral wealth consists of petroleum and salt. Petroleum exists in large quantities in Rumania. From Turn Severin, on its western border, the petroleum zone can be traced at the foot of the Carpathian Mountains, skirting them in their course through the country towards Bukovina and Galicia on the north-east. Along the whole length of the zone mentioned may be seen primitive workings in the shape of comparatively shallow hand-dug wells. From 1873 the industry fell off considerably, probably on account of the American oil-field discoveries. In 1895 modifications were introduced into the mining laws, and a new stimulus given to the industry that had gradually been reviving, and from that date we find an ever-increasing development. It is claimed for Rumanian petroleum that the raw product contains 14, 15, and 23 per cent. more pure oil than American, Galician, and Caucasian oils respectively. In July 1898 there were in the four principal petroliferous districts:—

	Borings.		Hand Wells.	
	Productive.	Non-Productive or being Bored.	Productive.	Non-Productive or being Dug.
Dimbovitza .	...	...	115	40
Prahova . .	42	45	400	450
Buzeu . .	4	10	90	10
Bacau . .	40	8	340	120
Totals . .	86	63	945	620

The production in these same districts which in 1895 only reached 14,600 tons, amounted in 1897–98 to 134,180 tons, of which 93,382 tons were refined in the country—19,511 tons were exported, and 21,291 tons of residue were employed as combustibles. In the last year of the century the output amounted to 224,760 tons, of which 75,879 tons were exported.

The rock-salt strata are of large extent, reaching from the district of Suceava, in northern Moldavia, to the district of Gorj, in Wallachia, and attain a thickness in some places of 1000 feet. The production since 1875 has been :—

	Production.	Export.
1875 . . .	70,283 tons.	...
1880 . . .	73,410 ,,	...
1885 . . .	83,340 ,,	23,612 tons.
1890 . . .	107,971 ,,	34,113 ,,
1895 . . .	98,807 ,,	39,290 ,,
1898 . . .	112,650 ,,	36,045 ,,

The export is practically confined to Bulgaria, Servia, and Russia There is no doubt very varied and considerable undeveloped mineral wealth in the country, but it was long before any serious attention was paid to it. The Mining Law of 1895 has, however, been the means of attracting foreign capital and foreign specialists, and it may be confidently expected that at some no very distant period the wealth now produced above ground by agriculture, forests, vineyards, pasture, flocks, and herds will be largely supplemented by underground riches.

The total superficies is 32,302,080 acres, subdivided as follows: —40·82 per cent. is arable land, 25·76 per cent. is waste, 19·73 per cent. forest, 7·92 per cent. natural pasture, 4·28 per cent. artificial pasture, 1·06 per cent. vineyards, and 0·43 per cent. plum orchards.

Agriculture.

The accompanying table gives the mean annual area under cultivation, the produce per acre, and the total amount of the principal grain crops produced, calculated from the returns of five years, from 1894 to 1898; also the out-turn of 1899, when, owing to drought, there was almost a complete failure of the crops :—

	Surface sown. Acres.	Yield in Bushels per Acre.	Total Yield in Bushels.	Total Yield, 1899. Bushels.
Wheat .	3,618,846	15·12	54,718,403	25,258,475
Rye . .	505,605	15·81	8,073,100	1,926,925
Barley .	1,495,257	15·89	23,638,985	4,402,475
Oats . .	690,762	17·36	12,092,680	6,062,100
Maize .	4,708,282	14·34	67,534,499	26,873,893
Rapeseed .	108,241	11·56	1,299,655	440,825
Linseed .	67,161	8·69	585,055	33,275
Millet .	191,800	8·36	1,604,658	1,641,686
Beans .	308,059	9·95	3,067,754	224,069

Roughly speaking, about one-half of the cereals produced is employed in home consumption, whilst the other half is exported to foreign countries.

The vineyards have not been spared by the phylloxera, which made its first appearance in 1882, and developed seriously in 1884; but they are recovering from its effects, and the acreage under vines has risen from 126,000 acres in 1865 to 343,800 acres in 1898. The wines produced in the mountainous and hilly districts are greatly superior to those of the plains: they contain more alcohol and less tannin, and although slightly more acid, have a superior flavour. The best known vineyards are those of Cotnar and Socala (near Jassy), for white wines; Nicoreshti (Tecuciu), Odobeshti (Putna), Dealu Mare, Drancea, and Dragashani, which mostly produce red wines. The grape harvest varies enormously in different years. In 1865 the acreage under vine cultivation was only 236,910 acres, yielding 14,080,300 gallons; the production has now risen to 99,000,000 gallons.

In 1897 horses numbered 670,909; donkeys, 5214; mules, 247; horned cattle, 2,138,315; sheep, 6,847,825; goats, 286,876; and swine, 1,079,322. Of the three divisions, Wallachia, Moldavia, and Dobruja, the first is by far the most prolific of live stock, particularly sheep. Comparing these figures with similar returns of 1890, it appears that in seven years the number of horses has increased 11 per cent.; sheep and goats, 37 per cent.; swine, 14 per cent.; and that the number of horned cattle has fallen off 18 per cent.

Rumania is very rich in forests, which cover over 5,000,000 acres, or more than one-sixth of the country. Two-fifths are the property of the State; about one-half belongs to private individuals, and the remainder to private establishments and the Crown domains. The net profit derived by the State in the year 1898–99 was about £100,000, *i.e.*, about one shilling per acre. In the Crown domains forest schools have been established for the more scientific working of the forests, and it is to be hoped with more profit to the State.

About 139,000 acres are under plums, the produce of which is chiefly employed in the manufacture of *tzuica*, an ardent spirit much in vogue among the peasantry, the consumption of which is very considerable on the numerous ritual holidays of the Greek Church. The annual out-turn of this spirit is about 10,248,480 gallons, and in 1892 32,000 gallons were exported.

Fisheries.

The fisheries extend over a vast area, comprising the whole of the delta of the Danube between the Kilia and St George branches of the river, as well as the Danube itself and adjoining lakes, and the Black Sea littoral. The Government in 1895 introduced a close time, besides other measures, for the preservation of the fish. Since then the fishing industry has revived. The import of fish rose from 5981 tons in 1894 to 7583 tons in 1895, but by 1898 had dropped to 4238 tons. The export of fish rose steadily from 1315 tons in 1894 to 5562 tons in 1898. The fish exported consist principally of salted sturgeon (found in the vicinity of the Danube mouths, especially at that of St George, from which large quantities of excellent caviare are extracted), sterlet, and carp. The revenue from the State fisheries amounts to about £100,000 annually. More than half of the fish exported goes to Austria-Hungary.

Manufactures.

Up to the passing of a law in 1887 for encouraging national industries, Rumania was essentially a non-manufacturing country, but since that date much progress has been made. The law provided that any one undertaking to found an industrial establishment with a capital of at least £2000, or employing at least 25 workmen (of whom two-thirds should be Rumanians), should be admitted to certain substantial benefits, including the grant of about 12 acres of State land, exemption for a term of years from all direct taxes, freedom from customs dues for machinery and raw material imported, exemption from road taxes, reduction in cost of carriage of materials on the State railways, and preferential rights to the supply of manufactured articles to the State. Up to the end of February 1891 the number of firms which had been admitted to the benefit of this law was 84, with a total capital of about one million sterling. By the end of the century factories had increased to 178, and the capital invested to close upon three millions sterling.

Among the principal industrial establishments of Rumania are flour-mills, of which there are (1900) 7500 small local mills, besides 86 mechanical mills, of which 20 are large establishments (capital invested, £640,000), with a collective output of 2200 tons a day.

There are 43 large distilleries, each employing over 200 hands, besides many small stills. In 1898–99 the output of the 19 breweries in the country was 2½ million gallons.

The introduction in 1895 of the system of Government bounties caused a great development in the production of sugar, and there were in 1900 six large factories at work. More than half a million sterling has been invested in this industry. In 1892, 2500 acres only were under beetroot cultivation. In 1900 the area had increased to 30,720 acres.

There are 3 meat-preserving and 3 vegetable-preserving factories, 7 starch, paste, and biscuit factories, cement and lime factories, brick and basalt works, mechanical joinery works, 5 large glass factories, and 5 paper and 3 cardboard mills.

The production of chemicals and by-products has increased from 3000 tons in 1886 to 11,700 in 1898, while in the same interval the out-turn of vegetable oils has increased from 1900 to 3015 tons.

Rumania now possesses 7 iron foundries, besides factories for machines and various kinds of iron-work.

There has been considerable development of the textile industries, while domestic industry is still widespread. Tanning and leather-work is also growing in importance; but the wood industries are the most important of all branches of industry, and give employment to thousands of hands. There are 42 large saw-mills, turning out annually 25,000 waggons, jointly worth £600,000; much of which, mostly deal planking, finds its way by sea to Rotterdam and up the Rhine.

Commerce.

The great bulk of the exports consists of cereals; but other important articles are animal products (wool, hides, &c.), timber, salt, wine, and brandy (made principally from cereals and plums), and of late years there has been a rapid development of the production and export of flour and petroleum.

The following table shows the value of the import and export trade of Rumania since 1876 :—

Year.	Imports.	Exports.
	£	£
1876 . . .	6,637,340	9,410,250
1886 . . .	11,759,892	10,221,888
1896 . . .	13,516,916	12,962,266
1898 . . .	15,596,337	11,327,262
1900 . . .	8,463,439	11,200,017

The principal imports are textile goods, metals, and metal-work, such as railway material and agricultural machinery, coal, &c. The following table shows the value of the principal articles exported and imported in the years 1887, 1897; the latter year may be considered as a good average year both for exports and imports:—

	Thousands of Pounds Sterling.	
	1887.	1897.
Exports.		
Farinaceous products and their derivatives	8560	7200
Fruits, vegetables, and other plants	240	588
Animal products	104	160
Textiles	192	100
Timber	164	264
Live animals	232	92
Mineral combustibles, &c.	64	88
Hides and leather	104	60
Wine and alcohol	660	104
Metals and metal-work	84	72
Dyes, tannins, colours, &c.	4	4
Carriages, carts, &c.	4	...
Paper, cardboard, &c.	8	4
Imports.		
Farinaceous products and their derivatives	120	200
Animal products	160	220
Textiles	5520	6000
Timber	240	228
Live animals	16	108
Mineral combustibles	160	400
Hides and leather goods	720	640
Metals and metal-work	2120	2960
Dyes, tannins, colours, &c.	120	280
Carriages, carts, &c.	412	64
Paper, cardboard, &c.	480	240
Colonial products and fruits	1040	840
Minerals, glass-ware, &c.	640	300
Oils, fats, wax, &c.	200	280
Chemicals, &c.	120	220
Indiarubber, guttapercha	80	120
Preserves and confectionery	64	132

The following table shows the relative values of Rumanian trade with foreign countries, in percentages of the total value, which is also given, in the years 1889 and 1898:—

Country.	1889.	1898.
Imports from		
United Kingdom	27·80	19·55
Austria-Hungary	13·42	27·97
Germany	29·42	28·55
France	8·92	6·62
Belgium	5·25	3·62
Other countries	15·19	13·69
Total value	£14,717,763	£15,596,337
Exports to		
United Kingdom	52·89	15·33
Belgium	13·31	32·32
Austria-Hungary	5·54	30·22
Italy	8·44	7·08
Turkey	2·18	3·60
Germany	5·31	3·20
France	4·37	2·25
Other countries	7·96	5·00
Total value	£10,966,685	£11,327,262

The value of the trade between Great Britain and Rumania has varied greatly: in 1881 the value of the imports from Great Britain was £2,020,330; in 1889, £4,084,444; in 1895, £2,359,359; in 1899, £2,401,662. The exports to Great Britain amounted in 1881 to £3,289,082; 1889, £5,622,040; 1890, £6,455,420; 1895, £3,014,520; 1898, £1,498,364, but only £422,751 in 1899. The principal imports from Great Britain are tissues and textiles, coal and coke, machinery and metal goods.

Exports of cereals from Rumanian Danube ports through Sulina have been as follow in quinquennial periods 1875–99:—

	1875.	1880.	1885.	1890.	1895.	1899.
	Quarters.	Quarters.	Quarters.	Quarters.	Quarters.	Quarters.

* Including other cereals not specified.

Shipping. By the Berlin Congress of 1878 and a special conference of 1883 the Danube is regarded as an international waterway from its mouth to the Iron Gates, and the interests of the several countries are specially provided for. In 1898, 1419 vessels of 1,476,119 tons cleared from Sulina, 446 of 694,773 tons being British; 190 of 174,607 tons, Greek; 126 of 156,150 tons, Austro-Hungarian; 72 of 87,583 tons, Italian; 224 of 62,455 tons, Turkish; 133 of 59,989 tons, Russian; 43 of 43,263 tons, Rumanian; 33 of 41,593 tons, French; and 25 of 30,205 tons, German. Further information about the navigation of the Danube will be found under that head.

Communications. *Railways.*—The first railway line between Bucharest and Giurgevo, a distance of 45 English miles, was constructed in 1866–69. By 1874, 636 miles were open; by 1884, 994 miles; and by 1899, 1932 miles. As will be noticed under *Finance*, the entire railway system is owned by the State. The total amount actually expended on railways has been £28,705,082, including the construction of the bridge over the Danube at Cernavoda, which cost £1,375,480. The total revenue from the railways amounted in 1898 to £2,170,056, the working expenses £1,545,345. The railways give employment to 6559 permanent officials, and to 13,570 plate-layers, navvies, &c. The number of passengers carried by rail in 1898 was 5,779,090, while the merchandise carried amounted to 47,786,888 tons.

The railway system consists of a main central line carried from Suceava, on the frontier of the Austrian province of the Bukovina, and passing south through the whole length of Moldavia, and west through Wallachia to the Austrian frontier at Verciorova, with branch lines extending on the one side up the lateral valleys of the Carpathians, and on the other to Jassy, Galatz, and other large towns on the Danube. Jassy and Galatz are also connected by a direct line. Besides the above-mentioned points of junction, the Rumanian system is connected with that of Hungary at Predeal and at Palanka, with the Russian system at Ungheni, and with the Bulgarian at Rustchuk by a steam ferry. Another line through the Dobruja connects the Rumanian system (by means of a magnificent bridge over the Danube at Cernavoda) with the rising port of Constantza (formerly Kustenji) on the Black Sea, where extensive harbour works are now in progress.

Roads.—There are roads throughout the country of varying degrees of quality, and aggregating about 12,000 miles in length. In 1897–98 £170,000 was spent in repairs to roads and bridges.

Rivers and Canals.—The Danube is navigable for vessels drawing 9 feet of water, from the Iron Gates above Turn Severin down to Braila, and from thence to the sea at Sulina for vessels drawing from 18 to 20 feet (see DANUBE). Rumania possesses no canals, but rafts of timber are brought down many of the streams which rise in the Carpathians and fall into the Danube; and the Pruth is navigable for vessels of light draught for a distance of some 300 miles from where it enters the Danube at Reni.

Post and telegraphs. Since 1890 there has been a very large development in the telegraphic and telephonic system of Rumania. The length of telegraph wire is about 4000 miles. The following figures speak for themselves:—

	Number.	
	1888–89.	1897–98.
Staff	1,474	6,245
Letter-boxes	812	4,550
Letters	12,772,976	18,498,355
Postcards	3,436,453	11,386,586

Telegrams, inland, presented (private)	870,313	1,473,701
Telegrams (official)	105,862	147,349
" presented (foreign)	176,870	284,002
" received	136,311	253,434

Banking and credit. The principal bank, the Banque Nationale, founded in 1880 with a paid-up capital of 12 million francs (£480,000), has its headquarters at Bucharest, and branches in all the principal towns; it has the right to issue notes, repayable at sight and in gold. The reserve fund in 1890 stood at £460,000, the net profits for the same year amounted to £165,520, and the notes in circulation to £6,440,000, or rather more than double the metallic stock. Other Bucharest banks are the Banque de Roumanie, founded in 1884 with a paid-up capital of 7½ million francs (£300,000); the Banque Génerale Roumaine (1897), capital, 12 million francs (£480,000); the Crédit Belgo Roumain, capital, 5 million francs (£200,000); and the Banque d'Escompte, also with a capital of 5 million francs; Marmorosch, Blank, and Company, capital, 5 million francs; and other private banks. The Crédit Foncier Rural was founded in 1873, with the object of advancing money on mortgage of land. Since its foundation 4½ million acres of land have been hypothecated to it against advances of more than 12 millions sterling, provided by the issue of "lettres de gage" at 5 per cent. and 4 per cent., of which 10 millions were in circulation in 1897. Similar institutions exist for urban property in the cities of Bucharest and Jassy. In the former, in 1890, advances to the extent of 5½ millions sterling had been made on the security of house property. The Banque Agricole, founded by the State in 1894, with a capital of £500,000, for the purpose of advancing money on loan to small proprietors on the security of cattle, crops, wine, and other agricultural produce, does a large and profitable business, and is of great assistance to the poorer agricultural classes, besides returning a considerable revenue to the State. Government savings banks also exist in all the principal towns. On the 10th September 1898 the deposits amounted to 1¼ million sterling, furnished by 105,000 holders.

Recent History.

The present kingdom of Rumania consisted in the middle of the 19th century of two separate provinces, Wallachia and Moldavia, placed under the suzerainty of Turkey and the protectorate of Russia. It was autonomous in name, but its princes or hospodars were merely governors of provinces, acting under the orders of subordinate officials of the suzerain and protecting powers. The military occupation of the principalities by Russia immediately preceded the Crimean war, one of the principal results of which was the decision, under the Treaty of Paris, that the two countries, with their existing privileges, were placed under the collective guarantee of the Great Powers, still remaining, however, under the suzerainty of the Porte. Under the same treaty that portion of Bessarabia lying on the left bank of the Pruth and to the north of the Danube was restored to Moldavia, from which it had been taken by Russia in 1812. It was further decided to maintain the separate existence of the two principalities, but their inhabitants ardently desired a complete union, and in order to effect this Colonel Alexander Couza was in 1859 simultaneously elected prince of both Moldavia and Wallachia. In 1861 the union of the principalities was recognized by the Powers for the lifetime of Prince Couza, with a common ministry and a common assembly. The prince, by his ultra-democratic and despotic measures, succeeded in alienating the sympathy of all classes, of the clergy by the confiscation of the enormous landed property belonging to the Rumanian monasteries (whose revenues, however, principally went to feed the parent monasteries of Mount Athos); of the boyards by the abolition of the feudal obligations of the peasantry and the establishment of a class of peasant proprietors; and, finally, by the introduction of a tobacco monopoly he estranged the sympathy of the masses. His own dissolute conduct increased his unpopularity, and at last the leading statesmen in both provinces, who had long been of opinion that the welfare of the country could only be secured by having a foreign prince to rule over it, conspired to dethrone the prince, and in February 1866 he was compelled to abdicate. The same day a council of regency was formed, composed of General N. Golesco, Colonel N. Haralamba, and Lascar Catargi, with Prince John Ghika as head of the ministry. The count of Flanders, brother of the king of the Belgians, was proclaimed hospodar of the united provinces, but declined the proffered honour.

Meanwhile a conference of the Powers assembled at Paris to consider the situation, and decided by a majority of four to three that the new hospodar should be a native of the country. While the conference was discussing, the principalities were acting, and had resolved not to be baulked of their foreign prince. The choice of the country, by a happy inspiration, fell on Prince Charles of Hohenzollern: an appeal was made to a plebiscitum, and 685,969 electors voted in his favour, with only 224 dissentients. Prince Charles was the second son of the late Prince Charles Antony of Hohenzollern-Sigmaringen (famous for having from patriotic motives, and in the interest of German unity, voluntarily surrendered his principality to be merged into the kingdom of Prussia), and a cadet of the Catholic branch of the imperial family of Germany. Prince Charles was an officer in the Prussian army, 27 years of age, and was also related to the French imperial family: his nomination not only obtained the tacit consent and approval of his friend and kinsman King William of Prussia, but also the warm and more open support of Napoleon III. **Prince Charles.** The young prince was in a position of great difficulty. The king of Prussia, through his plenipotentiary at Paris, had agreed to the resolution of the conference that the hospodar to be elected should be a native of the principalities, and could not therefore openly approve of Prince Charles's election. The prince meanwhile received a telegram from Bucharest stating that five millions of Rumanians had proclaimed him their sovereign. The genius of Count Bismarck came to his aid, and acting on that statesman's advice, the prince determined to confront the Powers with a *fait accompli*. He asked for a short leave of absence, resigned his commission in the Prussian army on crossing the frontier, and hastened secretly to Rumania, under a feigned name and with a false passport; descended the Danube in an Austrian steamer, and surreptitiously landed on Rumanian soil on the 20th May at Turn Severin, where he was enthusiastically welcomed as soon as his incognito was thrown off. Travelling thence by post, the prince reached Bucharest on the 22nd May, and on the same day, in the presence of the provisional government, the deputies, the judges, and all the high officials, solemnly took the oaths to respect the laws of the country, to maintain its rights and the integrity of its territory. From that date to the present day the modern history of Rumania is indissolubly connected with its distinguished ruler, Prince Charles of Hohenzollern, afterwards King Charles I., one of the wisest and best of European sovereigns.

The *coup* suggested by Bismarck succeeded, thanks to the tact and energy of the young prince, whose first step was to commence the reorganization of the army, and to make preparations for resisting a menaced Turkish invasion, while at the same time carrying on negotiations with the Porte with the view of peaceably obtaining the recognition of his position by the sultan and the European Powers. After lengthy and complicated discussions, this object was attained, and in October the prince proceeded to Constantinople to pay his respects to his suzerain the sultan. His reception there was cordial, and he received from his majesty the firman of investiture. The principle of hereditary succession in the prince's family was agreed to, and also the right of the prince to maintain an army of 30,000 men. On the other hand, Rumania was to form an integral part of the Ottoman empire, within the limits fixed by the capitulations and the Treaty of Paris. The first Rumanian ministry formed under the new régime was composed of the leading statesmen of the country, of all political parties, care being also taken that the two provinces should be equally represented. Thus Moldavia contributed the Conservative, Lascar Catargi, the president of the council and minister of the interior; Pierre Mavrogheni, the minister of finance, also a Conservative; Prince John Ghika (Moderate Right),

minister of war; and Demetrius Stourdza (Centre), minister of public works. Wallachia, on the other hand, was represented by John Bratiano (Liberal) as minister of finance; C. A. Rosetti (Extreme Left), minister of worship; and John Cantacuzene (Centre), justice. Most of these have subsequently taken a prominent part in public affairs. Catargi died in 1899. The first business of the Assembly was the preparation of a new constitution, which was unanimously passed by the Chamber on 11th July, and on the following day the prince solemnly took the oath to maintain it. It provided for an Upper and Lower House of Representatives, and conferred on the prince the right of an absolute and unconditional veto on all measures passed by the Chambers. A few days after the proclamation of the constitution dissensions arose in the ministry. Bratiano and Rosetti could not work in harmony with the Conservative Catargi; the latter resigned, and Prince John Ghika was called on by Prince Charles to form a new ministry. The first Parliament elected under the new régime met on 27th November, but the Government of Prince Ghika could not command a majority in either house. The position was difficult in the extreme: the finances of the country were in a deplorable condition, there was an empty treasury, and the floating debt amounted to seven millions sterling; maladministration was rampant in every department of the state; the national guard were mutinous and out of hand, while the small army of regulars was badly organized and inefficient. The existence of famine and cholera added materially to the difficulties of the Government, and in March 1867 the Lower House, by a majority of three, passed the laconic resolution, "The Chamber inflicts a vote of blame on the Government." As the result of this vote M. Kretzulesco, a Moderate Conservative, was called to the head of affairs, and J. Bratiano entered the Government as minister of the interior.[1] The new ministry, of which Bratiano was the leading spirit, showed considerable energy: a concession was granted for the construction of the first Rumanian railway, viz., from Bucharest to Giurgevo on the Danube. The active army was raised to 20,000, with a reserve of 10,000 men, and a militia was formed 30,000 strong. It was further decreed that every able-bodied Rumanian between the ages of 20 and 40 was liable to serve in the army or in the landsturm, which was to consist of an additional force of 50,000 men.

Amongst other measures which were not so judicious was a decree ostensibly directed against vagabond foreigners, but in reality against the Jews, although it provided for the expulsion of all persons who were without proper means of subsistence. Large numbers of Jews were expelled from Jassy, Bacau, and other parts of northern Moldavia, and many respected proprietors and men of business were exiled and imprisoned under pretence of carrying out the new law. These harsh and unjustifiable measures created great excitement and indignation, especially in France and England, and the Emperor Napoleon wrote personally to Prince Charles, protesting against this persecution and against the minister who had caused it. The venerable Sir Moses Montefiore himself proceeded to Bucharest to interfere on behalf of his co-religionists. The country could not afford to lose the goodwill of the emperor of the French, at that time one of the most powerful factors in Europe, and in July Bratiano, although immensely popular in Rumania, found it necessary to resign office, and with him fell the rest of the cabinet.

Jewish question.

[The Jewish question has always been a thorn in the side of Rumania. When the new constitution was drawn up in 1866, one of its original provisions was that "religious belief shall be no obstacle to naturalization in Rumania." This excited so much indignation in the country that serious rioting took place at Bucharest, and the synagogue recently erected there was burned to the ground (though subsequently rebuilt at the expense of Prince Charles). The obnoxious proposition was withdrawn, and the following article was substituted, "Only Christians can become citizens of Rumania." The bitter feeling against the Jews in Rumania is not so much due to religious fanaticism as to personal interest, and to the not ungrounded fear that if given political and other rights they will gradually possess themselves of the whole soil and oust the original proprietors of the country. In many towns in northern Moldavia the Jews are in a majority, and their total numbers in the united provinces are about 300,000, *i.e.*, about $\frac{1}{18}$th of the entire population, a larger ratio than exists in any other country in the world. In most places they have the monopoly of the wine and spirit shops, and retail trade generally; and as they are always willing, like most of their race, to advance money on usury, and, moreover, are more intelligent and better educated than the ordinary peasant, there is little doubt that in a country where the large landowners are proverbially extravagant and reckless, and the peasant proprietors poor and needy, the soil would soon fall into the hands of the Jews were it not for the stringent laws which prevent all foreigners (including therein all non-naturalized Jews) from owning land outside the towns. When in addition it is considered that the Moldavian Jews, who are mostly of Polish and Russian origin, speak a foreign language, wear a distinguishing dress, and keep themselves aloof from their neighbours, the antipathy in which they are held by the Rumanians generally may be understood, although perhaps not justified. The fact, however, that no attempt has ever been made to interfere with their religion, or religious practices and customs, is a proof that this antagonism has nothing to do with religious fanaticism.

National question.

Another difficulty for Prince Charles's Government came to the front at this period, which, like the Jewish question, has been and still is a constant source of anxiety to Rumanian politicians—the so-called "national question." Outside the limits of the united provinces of Moldavia and Wallachia, now forming the kingdom of Rumania, exist more than four million people of Rumanian race, speaking the Rumanian language; of these one and a quarter million inhabit the Hungarian province of Transylvania, where they form a large majority of the population. A still larger number are to be found in the Banat and other districts west and north of Transylvania. Some 230,000 inhabit the Austrian province of Bukovina, and close upon one million are in Russian Bessarabia; they are also numerous in Servia, while some 500,000 are scattered over the European provinces of Turkey under the name of Koutzo-Vlacks. Now, these Rumanians, especially those living in the south-eastern provinces of Hungary, have always been jealous in maintaining their language, religion, and customs against encroachments from without. A Rumanian printing press was established at Brasso (Kronstadt) in 1533. In the 17th century the ancient Slave language of their religious books was replaced by Rumanian, and the inhabitants of Moldavia and Wallachia were chiefly indebted for their earlier civilization to the efforts of their compatriots in the north of the Carpathians. As early as 1791 two Rumanian bishops of Transylvania submitted to the emperor of Austria a list of grievances to which their people were subjected, and petitioned that they might receive equal administrative rights with their neighbours the Magyars, the Slaves, and the Saxons. In 1848, when the Hungarians revolted under Kossuth, and were crushed by the united forces of Austria and Russia, the Rumanians of Transylvania took an active part against their Magyar oppressors, and committed many atrocities, after which Hungary and Transylvania came under the direct, absolute, and reactionary rule of Austria. As long as this lasted the Rumanians had comparative peace, for at least they were treated no worse than the Magyars and other races: a metropolitan and two bishops were appointed, Rumanians of mark sat in the Transylvanian Diet, and the people were fairly content. But in 1867, when the federation and centralization of the Austrian empire came to an end, and was replaced by the Dual Monarchy, Transylvania again came under direct Hungarian rule, and later on was deprived of its autonomy. Ever since then the Hungarians have done their best to Magyarize the Rumanians, Saxons, and other constituent races of the kingdom. Whilst Austrian policy has been directed towards decentralization and the bestowal of a reasonable amount of independence on its various constituent nationalities, the policy of the Hungarian monarchy has been exactly the reverse. But the formation of a strong Rumanian principality in 1866 naturally encouraged the Rumanians to the north of the Carpathians in their endeavour to resist all attempts at Magyarization, and although no Irredentist movement has openly taken place, there is no doubt that secret hopes exist among large numbers on both sides of the Carpathians that at some future time the whole of the Rumanian people may be united in one common kingdom. As early as 1867 the Emperor Napoleon wrote to Prince Charles, warning him that his Government had nothing to gain by protecting the propaganda which was being undertaken in favour of a more intimate connexion with the Rumanian co-religionists of Transylvania. This was, no doubt, an allusion to the foundation at Bucharest of a "Transylvanian Society," which within a year of its foundation (1867) had 1200 adherents. Its policy was not to confine itself to the development of the culture of the Rumanians of "Central Dacia," but was also to give it a national and Latin direction, instead of the so-called Gothic and Scythian. The Hungarians maintain that the Rumanians have not much to complain of. Their Church is recognized, their bishops have seats in the National Assembly and are paid out of State funds. They are also allowed their schools, their associations, their literary societies, and their newspapers. They have the electoral franchise, and from their numbers they might, it is said, be represented by seventy deputies in the Chamber at Budapest; but the influence of the landed classes (mostly Magyars), the electoral qualifications, the arrangements of the districts, and, above all, the unfair and active interference of the Magyar officials, make it impossible for the Rumanians to obtain a fair share of representation. In 1892

[1] Under the new Government the Chambers passed a resolution conferring the honorary citizenship of Rumania on W. E. Gladstone and J. A. Roebuck, as well as on the Frenchmen Michelet and Quinet, in recognition of their efforts on behalf of the Balkan States.

they had only one deputy in the Assembly, and in that same year the Rumanians decided in future to take no part whatsoever in the elections, so that two and a half millions of people are now without a representative. Although the Rumanian communes in Hungary possess more than 2000 elementary schools, receiving no State aid, the study of the Magyar language is compulsory, and in the more advanced schools and colleges which are assisted by State funds the professors are nearly all Magyar. These schools are attended by a very small number of Rumanian students, and constitute a powerful agency for the Magyarization of the country. In 1872, 1881, 1884, 1887, and 1890 manifestoes were issued by the national party demanding autonomy, the recognition of Rumanian as the official language, universal suffrage, State subsidies for schools, &c.; and in 1892 large numbers of citizens went to Vienna to present a memorandum to the emperor, protesting against the Magyar Government and demanding separation. This step naturally excited indignation and reprisals, the more so as the Ligue Roumaine of Bucharest agitated in favour of the petitioners, who on their return to their homes in Transylvania were prosecuted and imprisoned for treason. The same fate befell several editors of national newspapers. Another result of the increased bitterness caused by this agitation was a decree of the Hungarian Government substituting Magyar names for the existing Rumanian names of districts, towns, villages, and even rivers. Nevertheless the Rumanian element continues to increase, owing mainly, it is said, to the influence of the Rumanian women, who, when married to Magyar husbands, bring up their families as Rumanians and not as Magyars.

It may well be supposed that this national question often caused very great friction between the Austro-Hungarian monarchy and the neighbouring state of Rumania, the more so as in the latter country it has been made a great party question. The national movement has found its chief support in the National Liberal party, but, whichever party is in power at Bucharest, it has to temporize in order to maintain friendly relations with the Austro-Hungarian empire on the one hand and to avoid running counter to public opinion on the other. Thus, every administration when in power is attacked by the Opposition for not giving adequate support to the national cause. M. Demetrius Stourdza, who when in Opposition was prominent in his denunciation of Magyar misrule, had when taking office in 1894 to issue a sort of manifesto explaining away his previous utterances. The question of a State subvention to the church at Brasso, which owns large properties in Rumania, has thus given rise to most heated debates in the Rumanian Parliament, as well as to very delicate negotiations with the Austro-Hungarian Government. A study of an ethnographical map shows a population of some nine millions of Rumanians forming an almost compact circular mass, of which the middle Carpathians form the centre; two-thirds of it form the kingdom of Rumania, and in spite of the present efforts to Magyarize the remaining third, it is by no means impossible that at some not very far distant period the whole may be united in one common nation.]

Kretzulesco's ministry was followed by that of Etienne Golesco. John Bratiano, however, went to Paris, where he succeeded in conciliating the French emperor, and shortly after his return he again entered the Government as minister of finance; but no ministry could reckon on a majority in the Chambers: in February various factions combined to defeat it, but the new majority was divided into three sections, and in November the prince decided to use his prerogative, and dissolved both Chambers. The elections passed off quietly, and the Chambers met on the 15th January 1868, when the speech from the throne insisted on the necessity for legislation for the army, the church, and finance. The Liberal Government had a large majority both in the Chamber and the Senate. But external pressure brought about another change of ministry: a revolution in Bulgaria, crushed with great severity by Midhat Pasha, gave rise to accusations that it had been fomented and encouraged by Rumania, and Austria showed itself bitterly hostile to the Government of Golesco and Bratiano. France, which had sent a military mission to Rumania for organizing the army, was indignant at the purchase by that country of Prussian needle-guns and the introduction of German officers to give instruction in their use, and was also angry with Prince Charles for having sent a political mission to St Petersburg with the view of establishing more favourable relations with Russia. Etienne Golesco resigned, and was succeeded as president of the council by his brother the general, while J. Bratiano became minister of the interior. An important measure was at once passed by the new ministry for the reorganization of the army, in which corporal punishment was abolished; a rural police was formed, and an important railway concession with the German financiers Strausberg and Offenheim was voted, a measure which was the cause of subsequent troubles. In June the Senate, having refused a credit to the ministers, was dissolved, and the new Senate which assembled in September was more pliable. Several useful measures were passed, including a Bill under which every able-bodied Rumanian was compelled to give three days' work in the year towards the construction of roads, or to pay a money equivalent. But foreign mistrust of Bratiano, especially in France and Prussia, reached such a point that another change in the ministry became inevitable, and on the 16th November Demetrius Ghika was called to the head of affairs, with Kogalniceano as minister of the interior. In 1869 the French military mission was recalled, and the relations between France and Rumania were greatly strained. The sympathies of the former country were entirely alienated by the endeavours of the latter to improve its relations with Russia and Prussia. During the early part of 1869 the country was quiet. At the head of Austrian foreign affairs was Count Andrassy, who sympathized with Rumania, and during his term of office the relations between the two countries greatly improved.

Postal conventions were passed with Austria and with North Germany, and the prince found leisure to preside at the military camp which he had formed at Furcani, where 12,000 men were assembled. The prince, ever since his arrival in the country, had made a point of becoming personally acquainted with all parts of his dominions, and had made himself very popular with the army and the masses, and it was a relief to him to tear himself away from the intrigues of politicians in Bucharest to receive a warm welcome from all classes in the interior. After a residence of three years in his adopted country, he felt that the time had arrived to make the tour of foreign countries, and to endeavour to improve his friendly relations with their sovereigns. Before leaving Rumania an amnesty was granted for all political and press offences, in order to show the prince's confidence that no intrigue was able to shake his hold upon the hearts of his people. In August he paid a visit to the Russian emperor Alexander at Livadia, by whom he was most kindly received and welcomed. This was followed by visits to the emperor of Austria, the king of Prussia, the king of the Belgians, and lastly the Emperor Napoleon. While staying at his ancestral home at Sigmaringen an arrangement was made, through his friend the crown prince Frederick of Prussia, for a meeting with the Princess Elizabeth of Wied. The romantic story of the meeting and rapid courtship, which lasted only a few hours, is well told in the published memoirs of the prince. The betrothal was very shortly followed by marriage (15th November 1869), and when they landed at Turn Severin they were received with the utmost enthusiasm—a strange and pleasing contrast to the prince's surreptitious disembarkation at the same spot three years previously on his first arrival in the country. The marriage was in every respect a happy one. The queen is a clever linguist, an accomplished artist, and a good musician. She has been described as a woman above the ordinary level of humanity, detached from material interests, living in the ideal, loving nature, poetry, music, painting, and all the arts, wholly devoted to noble causes, to Rumania and the Rumanians, particularly to the poor and suffering. She is well known to Europe, under the *nom de guerre* of "Carmen Sylva," as a royal authoress, who, even if she had not the advantage of rank, would still have made a name in literature. She has worked hard to protect native industries, and when living at her beautiful summer residence of Pelesch in the Carpathians she and her maids of honour wear the picturesque and lovely embroidered costumes of Rumanian women. The journey of the princely pair to Bucharest was one constant triumphal march, and their reception at the capital was in every respect worthy of the occasion. But the prince's difficulties and trials were by no means at an end: the Opposition made most violent attacks on the ministry and the dynasty, which in no wise diminished in intensity after Prince Ghika's resignation (February 1870), following a defeat on the budget. The succeeding ministry under A. Golesco was a very feeble one, and lasted only a few months, M. Jepurana being called on to form a cabinet in April. The latter's accession to power was followed by a general election, during which serious riots took place at Piteshti and Ploeshti, at both of which places collisions took place between the troops and the mob, and at the latter the national guard had to be disbanded.

The prince's marriage.

Much excitement was caused in Rumania by the outbreak of the war between Prussia and France, one of the immediate causes of which was the nomination of Prince Charles's elder brother, the crown prince of Hohenzollern, to the throne of Spain. The sympathies of the Rumanian nation were entirely on the side of their Latin sister, while those of the prince were naturally with his native country; and in spite of the opposition of the ministers, who were strictly neutral, a motion was passed in the Chamber to the effect that the sympathies of Rumania would always be with the Latin race. The excitement culminated in a revolutionary outbreak at Ploeshti, where a hot-headed deputy, Candiano Popescu, after the mob had stormed the militia barracks, issued a proclamation deposing Prince Charles and appointing General Golesco regent *ad interim*. Owing to the loyalty of the regular army the insurrection was speedily quelled, and Bratiano and Golesco, who were both believed to be implicated in the plot, were arrested, although shortly afterwards released.

Rebellion of 1870.

No doubt many influential men were involved, but the movement broke out prematurely and before due preparations had been made. It is worthy of note, as showing the magnanimity and wisdom of the prince, that Bratiano lived to render the greatest services to his prince and country, and that the rebel Popescu only a few years afterwards commanded the Rumanian battalion that successfully stormed the famous Grivitza redoubt at Plevna. But the feeling in the country was strong against the German sovereign. Six weeks later a jury acquitted the accused rebels, and the prince seriously thought of abdicating. On 7th December he wrote confidentially to the sovereigns of the guaranteeing Powers, suggesting that the future of Rumania should be regulated by a European congress, and stating that "only a strong government could remedy the internal and external evils of the country, which at present was in a most deplorable condition despite the wealth of its resources." A few days subsequently the prince learned that the German railway contractor Strausberg was unwilling or unable to pay the coupons of the railway bonds due on 1st January, which were mostly held by influential people in Germany. This threw the moral responsibility of payment on Rumania, and was a bitter blow to the prince, through whose instrumentality the loan had been placed, and whose one great consolation in life had been that it was to him that Rumania owed its railway system. He now hesitated about abdicating, as he was unwilling to forsake the country in the day of its peril. But more troubles were in store. The chief instigators of the recent rebellion succeeded in passing through the Chamber a resolution most insulting to the prince. Exciting and passionate debates ended in a vote of no confidence in the ministry. Prince John Ghika formed a new Government, and declared that his policy lay in effecting a compromise between the prince, who had lost all confidence in the country, and the representatives of the people. Matters were brought to a crisis by the Prussian Government threatening to use pressure to force the Rumanian Government to act in accordance with its guarantee, and provide for the unpaid coupons of the German railway loan. The country was financially in no condition to comply. Bitter indignation prevailed against everything German, and culminated in an attack on the German colony of Bucharest on the occasion of a banquet given on the emperor's birthday on 22nd March 1871. The mob was only dispersed by the military after having been in possession of the streets for two and a half hours, shouting "Long live the republic!"

This was more than the prince could bear. On the following morning he summoned the members of the Lieutenance Princière of 1866, and informed them of his intention to place the government in their hands. Lascar Catargi and General Golesco, the only two members present, as well as Demetrius Stourdza and other influential persons, solemnly adjured the prince to abstain from a step which they felt convinced could only bring the greatest misfortune on Rumania, and they declined to accept the responsibility. Catargi offered to unite the different sections of the Conservative party in order to conjure away the difficulties that beset the country. The prince accepted his offer. Catargi formed a ministry to which all the most respectable members of the country rallied, comprising Kretzulesco, General Tell, Mavrogheni, General Floresco, and other well-known patriots, and the hostile Chamber was dissolved. The excellent reception accorded to the prince and princess in a tour through Moldavia while the elections were pending drove all thoughts of abdication out of the prince's head. There had been a reaction in public opinion, greatly owing to the publication of a most pathetic letter from the prince, containing the reasons which had induced him to contemplate abdication. The elections took place early in May (1871), and the Government, to which all the most respectable elements in the country had rallied, had a large majority in the Chambers. When Parliament met in May the prince had a most enthusiastic reception. It was the inauguration of a new régime. Catargi's ministry was the tenth that had held office in the five years that had elapsed since the prince's arrival, but it was the first one that was stable, and was destined to last till 1876. The anti-German feeling in the country had greatly subsided, in consequence of the crushing defeat of France, and in January 1872 the Chambers passed a law by which Rumania undertook to pay the railway coupons. The German syndicate was satisfied, and the railway crisis was ended. Rumania now passed through a peaceful stage. The death of Napoleon III. in January 1873 moved the nation greatly, for the dead emperor had been the champion and protector of the national existence of Rumania in its darkest days. The universal sympathy shown with the widowed empress and the prince imperial created a certain temporary friction with the republican Government. Later in the year Rumania was well represented at the Vienna Exhibition, when the prince was most cordially received by the Austrian emperor. On leaving Vienna visits were paid to the Tsar (at Ems) and the Emperor William. On the 9th April 1874 the country was thrown into the deepest grief by the death of the Princess Marie, the only and dearly loved child of Prince Charles and the Princess Elizabeth. The universal sympathy shown on all sides to the bereaved parents helped much to strengthen the bonds by which the prince was attached to the country. In March 1875 the budget for 1876, amounting to 100 million francs, nearly double in amount that of the year 1866, was passed without difficulty, and on the 28th of the month the parliamentary session was closed. It was the first occasion in Rumania that the same Chamber had sat for the whole constitutional period of four years, and also the first time that the same ministry had opened and closed the same Chamber. The speech from the throne dwelt with satisfaction on the work that had been accomplished during the above period, viz., financial and administrative reform, regulation of the public debt, loans both external and internal successfully floated, new resources derived from stamp and licence taxes, and from the creation of a tobacco monopoly, the foundation of the State agricultural bank, organization of the State domains, the passing of a customs law with a new tariff, and the provisional settlement of the various complicated questions connected with the railways. Important reforms had also been carried out in the army, the Church, and the judicial department. During the same period international conventions had been signed with Austria, Russia, and Servia, and Rumania had joined the International Postal Union.

The Liberal Opposition under Bratiano, tired of being so long out of office, did their utmost to secure a majority against the Government in the new Chambers, the election for which took place in May. No stone was left unturned: emissaries were sent into the districts to preach revolt; in the Liberal press it was declared that all or any means were legitimate with the view of upsetting the ministry; tumultuous and riotous meetings took place at Bucharest; but in Rumania the Government which superintends the elections has always means at its command to ensure a majority, and M. Catargi, in spite of the most unscrupulous and powerful opposition, found himself with a large majority in the new Chambers, and was able before the close of the year to obtain from Parliament approval of a commercial treaty to be signed with Austria-Hungary, a most important measure, not only giving great commercial relief to the country, but being a long step forward in the direction of obtaining Rumanian independence, an aim never absent from the minds of patriotic Rumanians, and now shortly to be realized. Before obtaining it, however, the country had to pass through difficult times. The budget presented to the Chambers in March (1876) showed a deficit of 30 million francs; the Senate refused to pass it, and was dissolved; and the new elections gave but a feeble majority for the Government. Dissensions broke out in the cabinet, which was defeated in the Chambers on the budget. This was followed by the resignation of the Catargi ministry, which for five eventful and on the whole prosperous years had governed the country.

The fall of the ministry saved the country from revolution. A widespread conspiracy was on foot, fomented by the leading Liberals, for the arrest and expulsion of the prince, and the formation of a provisional government under General Dabija. The prospect of a return to power put an end to these machinations. Catargi's ministry was succeeded by a very short-lived administration under General Florescu, known as the "cabinet of the generals," which after an existence of only one month was succeeded on 8th May by a so-called "ministry of conciliation" under M. Jepureano, during whose short tenure of office a new Chamber was elected, by which the commercial treaty with Austria was ratified, under strong pressure and even menace on the part of the Austrian Government. A commission of the Chambers drew up an indictment against Catargi and his late colleagues, accusing them of violating the constitution and the public liberties, squandering the State revenues, and abuse of power when in office. Unable to stem the tide of popular passion, which was crying for impeachment, Jepureano resigned office, and M. Bratiano on 4th August was entrusted with the formation of a new Liberal cabinet, destined to guide the country through many eventful years. A prominent member of it was M. Stourdza, who subsequently succeeded Bratiano as head of the Liberal party. The programme of the new ministry was declared to include respect for the constitution and the law, honesty in the administration, great economies in expenditure, and the decentralization of the administrative services. But the reopening of the Eastern question was destined to bring to a climax the great struggle of Rumania for existence and independence as a nation, and temporarily to throw into the shade all domestic questions. The revolution in Bosnia and Herzegovina towards the close of 1875, followed a few months afterwards by the declaration of war between Turkey and the tributary states of Servia and Montenegro, were events which could not leave Rumania unconcerned. Her powerful neighbours Austria and Russia had sounded her ruler as to his intentions in case of a universal outbreak; Prince Milan of Servia had unsuccessfully begged Prince Charles to join him in declaring war against their common suzerain the sultan; and Prince Charles, although declining this tempting offer, seized the opportunity of reminding the Sublime Porte of certain unsettled disputes between them, and made various proposals, all of them

tending to the practical emancipation of his country from the subordinate position in which it was placed. The insurrection in Bulgaria, with its accompanying horrors, followed by the deposition of Sultan Murad and the succession of the Sultan Abdul Hamid, contributed to indicate the near approach of a Russo-Turkish war. Russia had shown symptoms of anger against Rumania for not having taken up a decided attitude in the approaching struggle, and the Russian ambassador Ignatieff had some months previously threatened that his Government would seize the Danube principalities as a pledge as soon as the Turks occupied Servia and Montenegro. The whole of Russia, with the exception perhaps of the Tsar himself, was bent on war. Prince Charles decided to send a mission, composed of Bratiano and Colonel Slaniceanu (the minister of war), to the imperial headquarters at Livadia. They were well received by the emperor (October 1876), but in spite of mixed threats, menaces, and cajoleries on the part of Gortschakoff, Ignatieff, and others, Bratiano returned without having definitively committed his country to active measures.

On 14th November six Russian army corps were mobilized to form the army of the south under the Grand Duke Nicholas. A few days later two secret envoys arrived at Bucharest, the one M. de Nelidoff, to negotiate on the part of the Russian Government for the passage of their army through Rumania, the other Ali Bey, to arrange on behalf of the sultan a combination with Rumania against Russia. Prince Charles cleverly temporized with both Powers. Negotiations with Russia were continued, and M. Bratiano was sent to Constantinople to put pressure upon Turkey to secure certain rights and privileges which would *de facto* have made Rumania an independent power, except that it would still have paid a fixed tribute; but the conference of the Powers assembled at that capital came to a definite end on the 19th January 1877, when the Turkish Government declined every proposal of the conference as being opposed to the "integrity, independence, and dignity of the empire." Meanwhile the Porte, in issuing Midhat Pasha's famous scheme of reforms, had greatly irritated Rumanian politicians by including their country in the same category as the other privileged provinces, and designating its inhabitants as Ottoman subjects. A secret convention was signed between Russia and Rumania on the 16th April, by which the latter allowed free passage through the country to the Russian armies, the Tsar engaging in return to maintain its political rights and to protect its integrity, while all matters of detail connected with the passage of the Russian troops were to be regulated by a special treaty. On the 23rd April Russia declared war against Turkey, and the Grand Duke Nicholas issued a proclamation to the Rumanian nation, announcing his intention of entering their territory in the hope of finding the same welcome as in former wars. The entry of Russian troops into Moldavia preceded by some hours the declaration of war, and various important strategic points were at once seized and occupied. The Rumanian Government made a platonic protest against the crossing of the frontier, and the Rumanian troops fell back as the Russians advanced; provisions and stores of all kinds were supplied to the invading army against cash payments in gold, and the railways and telegraphs were freely placed at their disposal. The Rumanian Chambers were assembled on the 26th April, and the convention with Russia was sanctioned by 69 to 25 votes in the Chamber, and by 41 to 10 in the Senate, in spite of vigorous opposition on the part of Stourdza, Carp, and Epureano. The Ottoman Government immediately broke off diplomatic relations with Rumania, and on the 11th May the Chambers of Bucharest passed a resolution that a state of war existed with Turkey. Rumania has been much blamed for joining Russia in this war against the suzerain power. There is no doubt that the prince from his first connexion with Rumania had the independence of the country in view. It is on record that in his interview with King William of Prussia in 1866, prior to his accepting the call to the principality, he stated that "although he was ready to acknowledge the Turkish suzerainty for a time, he reserved to himself the task of freeing his country by force of arms, and of gaining perfect independence on the field of battle." For eleven years he had been developing the military forces of the principality in order to be prepared for all eventualities, and when the crisis arrived he had neither the power nor the inclination to resist the passage of the Russian armies through his territory; still less had he the wish to see his country become the scene of conflict between the two great opposing Powers, which would inevitably have resulted from the maintenance of a strict neutrality. Turkey, on the other hand, hoped up to the last that Rumania would not openly join Russia against her, and it was perhaps this hope that induced her to observe a strictly defensive attitude, and to abstain from commencing hostilities against Rumania by an invasion of that country.

Russo-Turkish war.

Russia thought herself quite capable single-handed of waging a successful war against Turkey, and being quite content with the grant of a free passage through Rumania, had at first no desire to insist on her active co-operation in the field. It was arranged, therefore, that the Rumanian army should retire into Lesser Wallachia, and occupy Kalafat and other points on the left bank of the Danube as far down as Giurgevo, thus protecting that part of the country from invasion, and at the same time covering the right wing of the Russian army while it was taking up its strategic positions between Giurgevo and Galatz. As soon as the Russians were ready to occupy Giurgevo (which covered Bucharest), the Rumanians retired westward as far as the river Olt. Thanks to the development of the military resources of the country, Prince Charles was able to put into the field and take command of two corps d'armée with 48,000 men and 180 guns, with about 70,000 men of the national guard and militia in reserve. On the 27th May the bombardment of Widdin from Kalafat, under the prince's personal orders, was one of the opening events of the war, and the coolness of the prince under fire created much enthusiasm among his soldiers and people. In the course of May Russia had placed 200,000 men on the north of the Danube, but owing to heavy floods it was not till the 27th June that the main passage of the Danube was effected at Simnitza, the crossing of a small force having taken place a few days previously at Braila. But it was soon discovered that the Russians had underrated the Turkish power of resistance, and that instead of a mere military promenade to Constantinople, Russia would have to put forth all her strength to bring the war to a successful issue. General Gourko's force, after a successful raid across the Balkans, was forced to retire in the face of strongly superior numbers. General Schilder-Schuldner, after capturing Nicopoli and taking 8000 Turkish prisoners, was defeated on the 20th July by Osman Pasha at Plevna, to which place the latter had hurried from Widdin in order to prevent the main Russian army from marching to Sofia. On the 30th July the Russians, having collected 30,000 men, made the second unsuccessful attack on Plevna, losing some 8000 men in the fight, and it was at one time feared that the Russian armies might be driven back across the Danube. But Russia's failure was Rumania's opportunity, which Prince Charles was not slow in seizing. In May the Tsar had intimated that Russia had no need of the support of the Rumanian army, and that if Prince Charles's Government wished to take part in the campaign, it must do so at its own risk and expense. After the first defeat at Plevna the Russian headquarters staff requested that the Rumanian army should occupy Nicopoli and take charge of the prisoners of war: Prince Charles declined to move his troops until he should receive a positive promise that the Rumanian corps should be maintained as a separate unit, under its own officers. After the second defeat at Plevna, which was attributed by the Grand Duke Nicholas to the fact that the Rumanians had not complied with his request to occupy Nicopoli, the Grand Duke again made repeated and urgent endeavours to secure the active assistance of Prince Charles and his army, but the former would not give way until the Russians agreed to give him the undivided command of the Rumanian army. This burning question was at last settled in his favour; the Rumanian troops proceeded at once to occupy Nicopoli, and the main Rumanian army commenced crossing the Danube on the 25th August at Corabia. Prince Charles himself joined the Russian headquarters on the 20th, and the same day the Tsar conferred on the prince the command of all the Russian troops before Plevna, and the Russian General Sotoff was appointed his chief of the staff. The troops placed under his orders (including the Rumanians) amounted at first to 75,000 men with 8000 horses and 442 guns. The third and last assault on Plevna took place on the 11th September, when the Rumanian army covered itself with glory, and, with the loss of 2600 men, captured and held the famous Grivitza redoubt (the unsuccessful attack on which on the 30th July had caused the Russians a loss of 6000 men). General Skobeleff the same day captured with fearful loss the Green Hill, but was unable to maintain his position.

The heavy losses incurred by the allied armies, no less than 16,000 killed and wounded, made it evident that Plevna was not to be reduced by assault. General Todleben, the famous defender of Sebastopol, was summoned to act as second in command to Prince Charles, with Prince Imeritinski as chief of the staff. Enormous reinforcements were brought up by Russia, and it was decided to attempt to compel the surrender of the Turkish army by a blockade. On the 18th September the Rumanians attacked the second Grivitza redoubt, but were repulsed with the loss of 20 officers and 583 men killed and wounded. On the 19th October a further attempt was made, and the redoubt was captured; but the Turkish reserves eventually recaptured it, inflicting a loss of 300 killed and 707 wounded. It was not till the 10th December that Osman Pasha made his desperate but unsuccessful attempt to break through the investing armies, and was finally compelled to surrender; 40,000 men and 77 guns fell into the hands of the victors. Two divisions of the Rumanian army were now detailed to blockade the virgin fortress of Widdin, whilst a third escorted the prisoners of war to the Russian frontier. The fall of Plevna left the Russian army free to commence its victorious march to Constantinople, and on the 31st January 1878 the preliminaries of peace were signed at Adrianople, one of the provisions of which was that Rumania

should be independent and receive an increase of territory. Widdin was surrendered to the Rumanians on 24th February, when the Turkish garrison marched out with all the honours of war.

The definite treaty of peace between Russia and Turkey was signed at San Stefano on the 3rd March. But Rumania was now to learn that in politics there is no such thing as gratitude. Although anxious to be represented at the peace negotiations, this claim was disallowed by Russia. On 29th January the Rumanian agent at St Petersburg was officially informed of the intention of the Russian Government to regain possession of the Rumanian portion of Bessarabia, *i.e.*, that portion which was ceded to Moldavia by Russia after the Crimean war. Rumania was to be indemnified at the expense of Turkey by the delta of the Danube and the Dobrudja as far as Kustendjie. The motive assigned was that this territory had not been ceded to Rumania, but to Moldavia, and had been separated from Russia by a treaty (Paris) of which scarcely a single provision remained in force. Moreover, the national dignity and honour of Russia demanded the reacquisition of this district. In reply to all remonstrances Prince Gortschakoff blandly stated, "Whatever arguments you employ, they cannot modify our decision, which is unalterable." Ignatieff was sent to Bucharest to try and reconcile the prince to make this sacrifice, and hints were thrown out that under certain circumstances Prince Charles might be elected to the throne of Bulgaria. But the proposed exchange of territory roused the most bitter indignation at Bucharest. It was discussed before a secret sitting of the Chamber and the Senate on 4th February, when, amidst the greatest excitement, the representatives of the nation declared that Rumania would defend the integrity of its territory to the last, with armed force if necessary. But in the end the weaker had to submit to the stronger. Bratiano and Cogalniceano were sent to Berlin to endeavour to prevail on the representatives of the Powers there assembled in June 1878 to veto the cession of Bessarabia to Russia; but the Rumanian delegates were not permitted to attend the sittings of the Congress until the Powers had decided in favour of the Russian claim. The Treaty of Berlin in dealing with Rumania decided to recognize its independence, subject to two conditions:—First (Art. xlv.), that the principality restores to the emperor of Russia that portion of the Bessarabian territory detached from Russia by the Treaty of Paris of 1856, bounded on the west by the mid-channel of the Pruth, and on the south by the mid-channel of the Kilia branch and the Stary Stamboul mouth. Second (Art. xliv.), that in Rumania the difference of religious creeds and confessions should not be alleged against any person as a ground for exclusion or incapacity in matters relating to the enjoyment of civil and political rights, admission to public employments, functions, and honours, or the exercise of the various professions and industries in any locality whatsoever; that freedom and outward exercise of all forms of worship should be assured to all persons belonging to the Rumanian state and to foreigners, and that no hindrance should be offered to the hierarchical organization of the different communions, or to their relations with their spiritual chiefs; and, further, that the subjects and citizens of all the Powers, traders or others, should be treated in Rumania without distinction of creed, on a footing of perfect equality. Article xlvi. declared that the islands forming the delta of the Danube, the Isle of Serpents, and the province of Dobrudja, as far as a line starting from the east of Silistria and terminating on the Black Sea south of Mangalia, should be added to Rumania. Other articles defined the international position of Rumania, while Article liii. decreed that it should have a representative on the European commission of the Danube. It was a bitter blow to the Rumanians, after all the sacrifices they had made on the field of battle, to find that the recognition of their long-hoped-for independence was to depend on the performance of two conditions, both of which were deeply repugnant to the nation at large. Bratiano wrote with some truth, that the Great Powers by sacrificing Rumania were able to obtain more concessions for themselves from Russia, and Lord Beaconsfield was constrained to admit that "in politics ingratitude is often the reward of the greatest services." The Rumanians submitted eventually, but with bad grace, to the retrocession of Bessarabia. "The Russian occupation (13th October 1878) passed off uneventfully, the Rumanian officials retired without a word, and Prince Charles was spared the pain of signing his name to any document in connexion with the cession," but the transaction caused bitter animosity in Rumania against Russia; while the diplomatic protests and violent language in the Chambers also produced a deep impression on Russian official circles, which was not without fruit when the new frontier between the Dobrudja and Bulgaria was delimited by a European commission, on which occasion Russia did her utmost to thwart and resist the pretensions of Rumania, especially as regards the proposals to include Arab Tabia (a fort commanding Silistria in Rumanian territory). The Powers, with the exception of Russia, supported Rumania; and although the point was ultimately decided in 1879 in favour of the latter, yet owing to Russian opposition the boundary was not finally demarcated till 1885. The Dobrudja was quietly occupied by Rumanian troops on the 26th November 1878. It was personally visited by the prince in October 1879, and in 1880 an organic law of a liberal nature was passed and promulgated. Most of the laws and regulations existing in Rumania were made to apply to the new possession; and although Art. iv. laid down that a special law would be passed regulating the representation of the population in the Rumanian Parliament, this has never been carried out, and the Dobrudja is still unrepresented in Parliament, and is governed by prefects depending on the minister of the interior at Bucharest. At the time of its cession the province was regarded as of but little value, so much so that many Rumanian statesmen wished to decline the proffered gift, yet it has since proved a most useful acquisition, especially since the connexion (1894) of the port of Kustendjie (now called Constantza) with the Rumanian railway system by the construction of a bridge over the Danube at Tchernavoda.

Cession of Bessarabia.

But it was Art. xliv. of the Treaty of Berlin that was to cause real trouble and tremendous agitation throughout the country. It will be remembered that Art. vii. of the constitution of 1866 laid down that "only Christians can become citizens of Rumania"—in other words, all Jews were excluded from the rights of citizenship, and as no foreigner could own land in Rumania outside the towns, it follows that no Jew could become a country proprietor. The Great Powers, moved by the demands and complaints of the Jews, and desirous of removing this disqualification, legislated accordingly, as has been shown in Art. xlvi. of the Treaty of Berlin; but public opinion in Rumania, already excited by the compulsory retrocession of Bessarabia, rendered it almost impossible for any Government to legislate in accordance with the wishes of the Berlin tribunal. In the first place, it involved a change in the constitution, which could only be effected by a constituent assembly elected *ad hoc*, and it was with the greatest difficulty, and amidst the greatest excitement throughout the country, that Bratiano was able to obtain the requisite majority in favour of the election of new Chambers for this purpose. The revising chamber met on 3rd June, and sat through the entire summer, and at one time the irritation of the Powers at the unexpected delay in carrying out their decision was so great that England proposed a collective note on the subject, to be executed by the Austrian cabinet; while Prince Bismarck threatened, in case the Berlin proposition was not carried out, to refer to the suzerain power at Constantinople! The prince was confronted with the choice of a rupture with the Powers or a revolution in the country, where there was a tremendous popular outcry against all concessions to the Jews. At last, however, on 18th October, the new Chamber repealed Art. vii. of the constitution of 1866, and it thus became possible for Rumanian Jews to become naturalized and to hold land. It was further decided to admit *en bloc* to naturalization the 883 Jewish soldiers who had served in the war of independence; but with all other Jews individual naturalization was required, and this was hedged about by so many difficulties, a special vote of the Legislature being required, with a two-thirds majority in each individual case, that although the compromise thus effected was accepted by the Powers, *faute de mieux*, the result in practice has been that, from 1880 to 1884, out of 385 persons who were naturalized in Rumania, only 71 were Rumanian Jews. Since that time they have been admitted by small driblets of not more than a few individuals in a year, so that the 300,000 Jews said to inhabit Rumania have practically derived no benefit whatever from the benevolent intentions of the Powers at Berlin, and are still regarded as foreigners; and although liable to military service and to the payment of taxes, are unable to own land or possess electoral or other civil rights. However, the Powers agreed to accept the resolutions that had been passed by the Chambers as meeting the necessities of the case. The two conditions on the performance of which depended the recognition of Rumanian independence had now been carried out.

Independence.

Italy was the first of the Great Powers to formally notify its recognition of Rumanian independence (December 1879); but Bismarck succeeded in prevailing on the western Powers not to give official recognition until another matter which vitally affected Germany's financial interests had been settled in its favour. This was the never-ending railway question, in which so much German capital was engaged. Great pressure was put on the Rumanian Government to pass a law through the Chambers for the purchase of the railways from the German capitalists. This measure was most unpopular in the country, and it was difficult to induce the Chambers to agree to the proposed terms of purchase; but at last, in the end of January 1880, the necessary Bill was passed; and then, but not till then, Bismarck gave the word, and England, France, and Germany formally recognized the independence of the country on the 20th February 1880. The first British minister accredited to Rumania after its admission into the family of European states was that able diplomatist Sir William White, who for two years previously had resided at Bucharest as her Majesty's representative. Six weeks

after his nomination as minister he signed a treaty of commerce and navigation between Great Britain and Rumania. The circumstances connected with it are curious. In 1875 the Rumanians, in order to emancipate themselves from the commercial engagements formerly contracted on their behalf by the Porte, and with the desire of bringing the Great Powers to recognize the right of the principality to conclude commercial conventions, drew up a most oppressive tariff of imposts on foreign products, which was to come into force on the 1st July 1876. The Government of Austria-Hungary lost no time, and concluded a convention in June 1875, stipulating for much lower duties than those of the general tariff. Russia and Germany followed suit. England, in order to spare the susceptibilities of the Porte, would not conclude a treaty direct with Rumania, but an arrangement was come to in November 1876 provisionally securing to British trade the full benefit of the Austrian commercial tariff. This was subsequently extended to 12th May 1878, but no farther; but through Sir W. White's exertions, on the 13th August the Rumanian Legislature conferred on British productions the benefit of the most favoured nation clause until such time as a definite treaty could be concluded. This arrangement lasted until the 5th April 1880, when the definite treaty was signed.

In the autumn of 1880 Prince Charles visited Germany, and as there now appeared but little prospect of the birth of a son and heir, it became necessary to regulate the succession to the throne. Art. lxxxiii. of the constitution of 1866 decreed that, in default of male heirs in line direct of Prince Charles, the succession should pass to the eldest of his brothers or to their descendants. In case of the line becoming extinct, or of the members of the Hohenzollern family renouncing their rights, Prince Charles was accorded the power of naming his successor from one of the reigning dynasties of Europe, subject to the approval of the national representatives. The prince now (1880) negotiated and obtained from the princely house of Hohenzollern a formal assent to and acceptance of this article of the constitution. His elder brother, Prince Leopold, hereditary prince of Hohenzollern, renounced his own claim to the succession in favour of his sons, whom he declared he would bring up with the view of one of them succeeding to the throne. An intimation of this decision was laid before the Chambers on Prince Charles's return to Rumania, and was received with hearty satisfaction. Early in 1881 it was generally felt that the time had arrived for Rumania to be created a kingdom. On 13th March the Tsar Alexander was assassinated, and the Rumanian Opposition made it the occasion of accusing the Liberal Government of aiming at republican and anti-dynastic ideals. To refute this calumny the ministry proposed the elevation of the Rumanian principality into the kingdom of Rumania, amidst the enthusiastic plaudits of Chamber and Senate. The prince, in accepting the resolution, declared that it was the beginning of a new page in the volume of Rumanian national life, and the end of a period full of struggle and difficulties, but also full of virile effort and heroic deeds: the wish of the nation was the guide and goal of his life, the love and confidence of the nation by which he had been surrounded during the fifteen years he had ruled the country had made the good days brighter, and had strengthened and confirmed him during those which were evil. He accepted the kingly title to fulfil the long-cherished wish of every Rumanian, and expressed the hope, "May the first king of Rumania enjoy the same love that has supported the last prince through all his troubles! The affection of this noble and brave nation, to whom I have devoted my whole existence, is more to me than all the greatness and brilliancy of a crown." Within ten days of this declaration the new kingdom was recognized by all the Great Powers. The coronation took place at Bucharest with much pomp and ceremony on the 22nd May 1881. The ceremony was attended by the king's elder brother, the hereditary prince of Hohenzollern, and his two sons, one of whom, Prince Ferdinand, was destined later on to become heir-apparent. The royal crown was constructed of steel made from Turkish cannon captured at Plevna, while that of the queen was of pure gold, without jewels or ornaments. Delegates attended from every district in the kingdom, throughout which there was universal rejoicing. King Charles was now able to continue to work out the development of the country, comparatively, but not entirely free from fears of serious foreign complications. Relations with Russia had remained strained ever since the war, and it was not till January 1881 that the Russians appointed Prince Durosoff as minister at Bucharest after the post had been vacant for two years. The question of the Dobrudja frontier was still unsettled, and owing to Russian opposition was not finally disposed of till three years later. At one time the dispute became very acute, and Rumanian troops forcibly occupied the Arab Tabia at Silistria, from which, however, they subsequently had to retire. Difficulties also frequently arose from the enforcement of an Alien Bill passed in April 1881, which gave the Government the right to expel all aliens whose presence was considered objectionable. Much trouble was experienced in settling the claims and counter-claims about the war accounts, especially as regards the claim made by the Russian Government for a return of a sum of 3,000,000 francs advanced during the war to enable the Rumanians to mobilize, which had been considered by the latter as a free gift. A compromise was made, both parties withdrawing their claims, and a final settlement was arrived at in April 1882.

The new kingdom.

Relations with Austria-Hungary were also on a very unpleasant footing. There were two principal subjects of discord—the navigation of the Danube and the national question. As regards the former (see DANUBE), the pretensions of the Austrian Government to have a preponderating position in the "Commission mixte du Danube," which was to be the governing power of that portion of the river between Galatz and the Iron Gates (no part of which is in Austrian territory), aroused a most bitter feeling in Rumania, which found vent in the speech from the throne addressed to the Chambers on the 27th November 1881, when the king asserted that the country was ready, both for the present and in the future, to make every sacrifice that might be necessary to ensure complete freedom of navigation. This speech gave great offence in Austria, nearly causing interruption in the diplomatic relations between the two countries. Apologies were made and explanations offered in the Chambers, and the matter was amicably arranged, not without violent attacks by the Opposition on both the king and the Government of M. Bratiano for their supposed subserviency to Austria. The Danube question reached another acute stage in 1883, when, on account of Austrian opposition, Rumania, although under the Treaty of Berlin she had a representative on the European commission of the Danube, was refused permission to participate in the congress held at London to regulate the Danube question. The formation of the "Commission mixte" was then finally sanctioned, but Rumania refused to submit to arrangements which so seriously affected her interests, and to which she was not a consenting party; and although sanctioned by treaty, Rumania gained her point, and the "Commission mixte" has never come into existence. The Danube question again came prominently forward in 1899, when strong protests were made by Rumania, this time supported by Russia, against the claims of Austria-Hungary to fix the tariffs for vessels passing through the Iron Gates, and to have exclusive police supervision over that part of the river. It will be seen that the Danube and the national questions are two very delicate matters, always more or less *en évidence*, and liable to compromise the relations between the dual kingdom and Rumania, and requiring great tact in their management.

Danube question.

Another measure adopted by Rumania in 1883 caused much irritation both in Austria and Russia, viz., the decision to construct extensive fortifications both around Bucharest and on the line of the Sereth, the latter to enable the country to concentrate troops against an invasion from the north-east. Austria considered that the former were directed against her, while Russia, with more show of reason, considered the construction of the Sereth works as directed against herself. Both sets of works had been designed by General Brialmont in 1882. In March 1883 the Rumanian Chambers voted £400,000 for their commencement, and they have since been completed at a total cost (including armament of the most modern type) exceeding four million pounds sterling. Fortunately, there has never been occasion to try their efficacy against either of her powerful neighbours, but they will no doubt materially help to defend Rumanian neutrality in any future complication that may arise.

It was not till towards the end of 1883 that a better feeling began to prevail between Rumania and her western neighbour. The king in the summer had paid visits to Berlin and Vienna, whilst Bratiano had interviews with Prince Bismarck at Gastein, and subsequently with the emperor of Austria at Vienna. Between them they succeeded in convincing the emperor of their wish to be on friendly terms with both Germany and Austria, and the relations between the latter and Rumania perceptibly improved. The *entente* was still further strengthened by the visit of the Austrian heir-apparent to the Rumanian court in April 1884, a visit which caused some irritation in Russia. The king's sympathies are and always have been thoroughly German, and were naturally extended to Germany's partner in the Triple Alliance, while he could never forget the ingratitude of Russia as displayed subsequent to the war. Bratiano, too, was no doubt at this period a sincere advocate of Austrian friendship on political grounds, whilst his own experience taught him to be very suspicious of Russia. But there was a strong anti-German party in the country, especially among the old boyards and the peasantry, among whom community of creed, ancient traditional influence, the entire absence of Russian merchants in the country (and the consequent avoidance of many petty but litigious questions), all contributed to bring about a sort of passive preference for Russia, whilst the bitter disputes that had occurred with Germany on the question of railway finance had left a very hostile feeling, often very detrimental to the king's popularity, notwithstanding the fact that the latter was constantly exerting

his utmost energies to further the material development and well-being of his country.

In March 1883 the Chamber and the Senate, on the demand of the Government, after most violent discussions, decided by overwhelming majorities to proceed to a revision of the constitution, and, as a necessary consequence, fresh Chambers had to be elected for that special purpose.

Revision.

The new Chambers consisted almost entirely of supporters of the Government, only twelve members of the Opposition being elected in each house, and at the opening of the session in May sixteen out of the twenty-four declined to take any part in the proceedings of the Chambers, as a protest against the violent and illegal manner in which they asserted the elections had been conducted by the Government. The principal mover in the direction of revision was the veteran Rosetti, who had preserved the full feelings of his early democratic aspirations, and insisted on bringing forward radical measures of electoral reform, by increasing the number of peasant freeholders, and by the establishment of a single electoral college, instead of the four, arranged according to wealth, provided for by the constitution. M. Bratiano would not agree to these fundamental changes, which would practically have resulted in universal suffrage. The moderate party was successful, and revision of the constitution was effected, but on non-revolutionary principles: three electoral colleges were formed instead of four (and in consequence Rosetti, with thirty-one of his partisans, took no further part in the proceedings); a considerable addition was made to the numbers of the Senate and Chamber of Representatives; trial by jury was established for press offences, with the exception of those committed against the royal family and the sovereigns of foreign states; these were to be tried by the ordinary tribunals without jury. Another Bill was passed by the same Parliament, but not without violent opposition, endowing the Crown with State lands, giving an annual rent of £24,000, in addition to the civil list fixed in 1866 at £49,000; another measure granted free passes on the railways and an allowance of twenty-five francs a day during the sitting of Parliament to all senators and deputies. The revision of the constitution was the cause of a split between the two heads of the Liberal party, Rosetti and Bratiano. These two were united by a most intimate friendship, and had in their early days conspired together as leaders of the revolutionary movement in 1848; both were elected members of the provisional government, and had been imprisoned and exiled together for many years; they were the principal movers in the revolution which upset Prince Couza in 1866, and in the election of Prince Charles as his successor. One never acted without the other. Rosetti was said to be the soul whilst Bratiano was the voice of the same personality. Their joint action had produced the most brilliant results for the country which gave them birth, but exposed them to much hatred and obloquy, chiefly on the part of the old boyards and their adherents. Since 1876 the Liberal party, under the direction of their two popular leaders, with Bratiano as prime minister, had held office without interruption, with the exception of a few weeks in 1881 at the time of the coronation, when John Bratiano surrendered the reins of government to his elder brother Demetrius. Rosetti did not long survive the quarrel, and died on the 24th April 1885, only surviving by one year another Rumanian veteran, Prince Michel Stourdza, who had ruled Moldavia with an iron hand from the time of the Russian evacuation in 1835 until 1849. He died an exile in Paris, leaving a fortune of nearly two millions sterling. Within a few weeks of Rosetti's death in May 1885, the king lost a beloved parent and a trusted friend and counsellor by the death of Prince Charles Antony of Hohenzollern. The revising Chambers having finished their special mandate, were dissolved in September 1884, and a new Parliament assembled in November, the Government, as usual, obtaining a large majority in both houses.

The year 1885 was marked by one very important event. The independence of the Rumanian Orthodox Church was formally recognized by the œcumenical patriarch of Constantinople. The Rumanian Church had claimed its independence from very ancient times, but under the Turkish suzerainty and Phanariote hospodars Greeks were generally elected as bishops, and the influence of the Greek patriarch at Constantinople came to be more and more felt. In 1872 a law was passed by which the bishops were elected by the Senate, the Chamber of Deputies, and the synod sitting as an assembly (the only other occasion on which provision is made for such an assembly is in the event of the throne becoming vacant without any apparent heir). It was subsequently decided to consecrate the holy oil in Rumania instead of procuring it from Russia or Constantinople; but the Greek patriarch protested. Secret negotiations were entered into which came to a successful issue. The patriarch feared on the one hand that the growing influence of the Russian Church would give a colour of Slavism to the whole Church, and that a Russian might eventually be appointed œcumenical patriarch at Constantinople, while the Rumanians hoped by means of the independence of their Church to deprive the Russians of all excuse for interfering in their internal affairs under the pretext of religion. The Rumanians, although obtaining complete independence, agreed to recognize the patriarch at Constantinople as the chief dignitary of the Orthodox Church.

The remaining years of Bratiano's administration were not marked by any very important events. Since the declaration of independence he had exercised an almost dictatorial power, and anything like a powerful parliamentary Opposition had ceased to exist, but this did not prevent the most violent attacks being made on him by an unscrupulous press, and by orators at public meetings. He had been too long in power; the numerous State departments were exclusively filled with his nominees; and some pecuniary scandals, in which the minister of war and other superior officers were implicated, helped to augment his fast-growing unpopularity in the country. New parties were formed in opposition, and National Liberal and Liberal-Conservative parties combined to oppose him. The former of these maintained that the Government should be the expression of the national will, and be guided by national rights and interests at home and abroad—in fact, that it should be essentially Rumanian, and, while maintaining friendly relations with foreign Powers, should in no wise allow them to interfere with the internal affairs of the country. They also advocated reduction of expenditure and the independence of the magistracy. The Liberal-Conservatives held generally the same views, but had as their ideal of foreign policy a guaranteed neutrality. Another party which now attracted considerable attention was that of the Junimists, or Young Conservatives.

The Junimist party.

The name was taken from a literary society formed in Jassy in 1874 by Messrs P. Carp, Rosetti, and Maiorescu, and transformed into a political association in 1881. Their programme for home affairs involved the amelioration of the position of the peasantry and working classes, whose progress they considered had been overlooked, the irremovability of the magistracy, and a revision of the communal law in the sense of decentralization. In financial matters they advocated the introduction of a gold standard and the removal of the agio on gold, also the introduction of foreign capital to develop industries in the country; and as regards foreign policy, they were strong advocates of intimate and friendly relations with Austria-Hungary.

In 1886 the Government negotiated a consular convention with Germany, under which all lawsuits connected with German successions in Rumania were to be submitted to and judged by German tribunals, and reciprocally Rumanian successions in Germany were to be dealt with by Rumanian courts. As few, if any, Rumanians resided in Germany, the proposed law was manifestly much in favour of the Germans; and the Opposition, with Demetrius Bratiano (brother of the premier), Vernescu, and J. Lahovari at their head, succeeded in stirring up such an agitation throughout the country against the proposed measure that it had to be withdrawn. On the 16th of September an attempt was made on Bratiano's life by a tavern-keeper named Stoica. This caused a temporary reaction against the flood of his rapidly-increasing unpopularity, and in the autumn session he was able to carry through the Chambers a further vote of thirty million francs for the Bucharest fortifications, and to pass other important measures, including a law for increasing the powers and improving the position of the communes. Stoica was subsequently condemned to twenty years' penal servitude, but his accomplices and instigators, who were believed to be connected with the parliamentary Opposition, were acquitted. In May 1887 the king was present at the consecration of the newly-restored metropolitan church of Jassy, where he was fairly well received, in spite of the most strenuous attempts of the Opposition to stir up the populace to a demonstration against his majesty and his absolutist minister, a good deal of whose unpopularity rested on the king, who, however, shortly afterwards strengthened his position in the country by publicly announcing that the heir to the throne had been finally selected in the person of his brother's younger son, Prince Ferdinand of Hohenzollern, who had been appointed a lieutenant in the Rumanian army the previous year. An unusual proceeding in Rumania, where the greatest possible license is allowed to the press, was the prosecution of the Opposition newspaper, the *Lupta*, for violent attacks upon the king: the editor was sentenced to two years' imprisonment and a fine of 5000 francs. Elections for a new Chamber took place in February 1888, and in spite of the very strong pressure which the Government in power invariably exercises on these occasions (although always proclaiming from the housetop the absolute freedom of election), the whole of the leaders of the Opposition were elected, viz., Demetrius Bratiano, Catargi, Lahovari, Blaremberg, and Fleva; and their partisans, who in the preceding Chamber mustered only about thirty strong, now formed fully one-third of the whole house. Both Conservatives and Radicals were imbued with the same fear that Bratiano, in consequence of his dislike of Russia, would throw the country headlong into the arms of Germany and Austria.

Almost immediately after the elections Bratiano tendered his resignation to the king, who only accepted it on the under-

standing that he should form one of a new ministry under Prince Ghika: this idea proving impracticable, Bratiano returned to power. On the 26th and 27th of March very serious riots broke out in the capital: the mob, at the head of whom were some prominent leaders of the Opposition, surrounded the palace, and were only dispersed by force. On the following day the Chamber of Deputies was invaded, and one of the ushers shot dead with a revolver. Two of the leaders of the mob, Messrs Fleva and Filipescu, were arrested; and although the Chambers passed a vote of confidence in the ministry, M. Bratiano definitively retired on the 4th April, after having held the premiership for twelve eventful years. It was no doubt high time that he did so, and if he had continued much longer in office it is probable that there would have been a revolutionary movement against the dynasty. During the previous Parliament a Conservative manifesto, signed by Catargi and D. Bratiano and other leaders of the Opposition, openly threatened that if the ministers were not removed prior to the general election the responsibility would be thrown, "not on those who served the crown, but on him who bore it"; and the name of Prince George Bibescu had been openly mentioned as a possible successor. There was great distress and discontent amongst the peasantry, in spite of three million francs having been voted by the legislature for their relief, and there was much anti-dynastic agitation throughout the country, owing to the fact that an unscrupulous Opposition tried to make out that the king was responsible for all the evils that befell the country. M. Teodor Rosetti, a prominent member of the Junimist party, was now called on to form a ministry, of which Messrs Carp, Maiorescu, Prince Stirbey, and M. Germani were the principal members. Fleva and Filipescu, the leaders of the recent rioting at Bucharest, were released almost immediately after the ministers had taken office. Serious agrarian riots broke out in many parts of Wallachia; several of the landlords' houses were pillaged, and the rioters were not put down without considerable loss of life. The close of the year was marked by the visit of the prince of Wales to the king at Sinaia, and by a general amnesty granted to the peasants implicated in the agrarian riots; also by the decision of the Cour de Cassation condemning General Anghalescu, who had been minister of war under Bratiano, to three months' imprisonment, loss of his rank, and a fine of 5000 francs, as well as the restitution of 25,000 francs which the State had lost through his maladministration.

As the new ministry was unable to obtain a working majority in a Chamber that had been elected under Bratiano's auspices, it was dissolved. In the new Chamber elected in October 1888 only five members of Bratiano's party retained their seats. The house was composed of 39 Junimists, 51 Conservatives (17 of Vernesco's party), 4 Socialists, and 40 Independent Liberals. In the Senate there was a strong Conservative majority, and the presidents of both houses were elected from that party. In November the ministry was modified in a Conservative direction by the accession to its ranks of General Manu, Vernesco, and A. Lahovari, all members of the old Conservative party. A determined effort was made in the new house for the impeachment of M. Bratiano and the members of his administration. It was resisted by the ministry, as the resolutions included condemnation of Bratiano's foreign policy, and were in fact directed against the king. After a three days' debate the motion was lost by one vote: a modified proposal for impeachment, from which criticisms on foreign policy were excluded, was then brought forward in the Chamber, and passed on the 21st of February by a majority of 101 to 41. In the course of the spring session (1889) M. Carp brought forward and passed through the Chambers a Bill for the amelioration of the position of the peasantry by the distribution among them of State lands.

Peasant proprietorship.

[The question of peasant proprietorship being of great importance in an agricultural country like Rumania, it seems desirable to give a retrospective glance at previous legislation on the subject. Up to the year 1864 the greater part of the soil was owned by the Church and monasteries, and by large boyard proprietors; there was also a small class of peasant proprietors, called *mochenéni* in Wallachia, *rèsèchi* in Moldavia, living and working in family communities; but the great mass of the peasantry cultivated the lands of the large proprietors, giving a certain number of days' work to their manorial lord, in addition to a tithe of the raw produce. They received in return a plot of ground proportionate to the number of animals they owned, and had also rights of grazing and of collecting fuel in the forests. In the above year, under the Government of Prince Couza, a new law was promulgated, conferring on each peasant family freehold property in lots varying from 3 to 6 hectares (1 hectare = $2\frac{1}{2}$ acres) according to the number of oxen that they owned. The man with no cattle received the minimum; the owner of 2 oxen got 4 hectares, and the possessor of 4 received 5 or 6 hectares. The price of the land, which was calculated on the basis of the value of the forced labour to which the landlord had been entitled, was about £4, 10s. per hectare, paid to the landlord by the State as compensation, and subsequently recovered from the peasants in fifteen annual instalments. In the first distribution, which took place almost immediately after the law was passed, 280,000 families in Wallachia and about 127,000 in Moldavia became freeholders, holding nearly 4 million acres or one-third of the cultivated area of the country. These peasant plots were all declared inalienable for 30 years. The law of emancipation, although passed with the best of motives, did not to any great extent benefit the peasantry. The limited size of their farms, and the necessity for buying wood and paying for pasturage, both of which were formerly free, prevented them from obtaining complete independence of the large proprietors, on whose estates they still had to work for payment in money or kind, while their improvidence soon got them into the hands of Jewish money-lenders, who, fortunately for the peasants, were by law unable to become proprietors of the soil. In 1866 and 1872 laws were passed for still further improving the position of these small proprietors, and in 1879 a measure passed the Chambers for allotting lands to 48,000 recently married couples, and also for restoring to many peasant families lands which had been alienated.

In 1882 great difficulties arose, especially in Moldavia, in connexion with contracts for labour between the peasants and the large landowners. M. Rosetti succeeded, after violent opposition from the boyards, in passing through the Chambers measures for the relief of the peasants. But legislation, however well meant, had not succeeded in greatly ameliorating their position, and in 1889 M. Carp, the Junimist leader, passed a most important measure, by which the State domains, amounting to nearly one-third of the total area of Rumania (originally the property of the Church and the convents, confiscated by Prince Couza in 1866), were to be gradually distributed among the peasantry. The land was divided into lots of 5, 10, and 15 hectares. Peasants having no land might purchase the smaller lots on very easy terms. Those who already held less than 5 hectares might purchase up to that amount. When a change of residence became necessary to enable the peasant to take up the new allotment, the State advanced 600 francs to each family to defray expenses. The price to be paid for the land differed in different districts, and was to be paid to the State in small annual instalments. If any land remained after satisfying the wants of the peasants, it was to be sold by public auction in lots of from 20 to 25 hectares. All lots in both cases were declared inalienable for 30 years. Under M. Carp's law 1200 model farms were also formed in the Baragan, or low ground lying to the north of the Danube. As a consequence of this law and previous legislation there are now no less than 556,127 peasant proprietors in Rumania (exclusive of the Dobrudja), owning 2,390,170 hectares of land, or roughly speaking about one-half of its cultivated area. The sale of the larger lots under M. Carp's law gave rise to so many abuses that in 1896 a law was passed abolishing their further sale.]

Shortly after the passage of M. Carp's Bill through the Senate the minister of justice, M. Vernesco, made some outrageous judicial appointments without the knowledge of his colleagues, and his action being disapproved of by them, he declined either to withdraw the nominations or quit the cabinet. M. Catargi was then called on to form a purely Conservative administration, and took office, with Vernesco, Lahovari, and Manu as colleagues. This shuffle of the cards was, rightly or wrongly, attributed in great measure to the influence of M. Hitrovo, the active and energetic Russian minister at Bucharest, who ever since his arrival in 1886 had been a thorn in the side of the ministers, who had great cause for anxiety in connexion with contemporary events in Bulgaria, viz., the incorporation of eastern Rumelia, the war between Bulgaria and Servia, the subsequent kidnapping, return, and final withdrawal of Prince Alexander of Battenberg, all of which events gave rise to fears of further complications and of Russian intervention which might have involved Rumania in serious difficulties. The advent of Catargi to power was regarded as a triumph for Russia, as the sympathies of the Junimist minister had been entirely on the side of Austria. The close of the Rosetti administration was marked by a royal decree (5th April 1889) conferring on Prince Ferdinand the title of His Royal Highness Prince of Rumania, the title of Crown Prince being withheld, as he was not the direct heir to the throne. Shortly afterwards the prince took his seat in the Senate amidst great enthusiasm.

Catargi's administration did not last long. He found it difficult to command a working majority in the Chamber that had been elected after Bratiano's downfall, and resigned on the king refusing to grant a dissolution. A new ministry was formed in November 1889 by General Manu out of mixed Conservative and Junimist elements, who pulled well together on all internal measures, although somewhat divided as to their foreign policy; and much good work was effected by the new Government. The old 6 per cent. loan was converted into 4 per cent. A gold standard was introduced, whereby the agio on gold was got rid of; a satisfactory budget was passed, and the 5 per cent. tax which had been imposed, prior to the war with Turkey, on the salaries of all Government employés, was abolished. The sale of State

lands to peasants under Carp's law was actively proceeded with, half of the State lands being parcelled out, and one-fourth actually sold. All further proceedings regarding the impeachment of Bratiano and the members of his ministry were stayed by a vote of the Chamber and Senate on the 15th February, to the great satisfaction of the king, who had always stood by the minister who had served him so well. On the 24th October 1890 the king laid with much ceremony the first stone of the new railway bridge over the Danube at Tchernavoda, and large sums were voted for railway extensions and for the completion of the Bucharest and Focsani fortifications. The country also was relieved in August of the presence of M. Hitrovo, who had lost much influence while his Conservative allies were in power, as his openly expressed Pan-Slavist views had alienated all his friends among the Rumanians. General Manu's ministry was destined, like the preceding one, to a short life. There was much distress and consequent discontent in the country, especially in Moldavia, which was by no means diminished by the consideration that that province was entirely unrepresented in the cabinet. In February 1891 the Government met with a defeat in the Senate by the rejection of their proposals on public education, and General Floresco was called on to form a new ministry. L. Catargi was appointed minister of the interior, and Vernesco was named minister of finance. On the meeting of the chambers M. Carp carried a vote of no confidence in the new ministry, and the king dissolved the Chambers. The new elections (April 1891) gave a large majority to the Government, but there were elected 40 National Liberals and only 6 Junimists.

The veteran statesman John Bratiano died on the 16th May, aged 76, and the king went to his residence at Florica to visit the widow and place a wreath on the tomb of his old and faithful servant. On the 6th July Kogalniceano, another veteran, passed away. Like Bratiano, he had been implicated in the national or rather revolutionary movement in 1848, and spent many years in exile striving for the union of the two principalities. He was minister of the interior under Prince Couza, and responsible for the important measures of the suppression of the corvée, the formation of a peasant proprietary, and the confiscation of the properties of the monasteries; and later on, as minister of foreign affairs for Prince Charles, he accompanied Bratiano to Berlin to struggle in favour of the rights and interests of his country. On 22nd May 1891 the jubilee festivities (25th year's reign) of the king were celebrated with much enthusiasm throughout the country. In November, a few days after the opening of the autumn session, Floresco's ministry resigned, and Catargi was once more called on to form a new Government. His new colleagues (including Tache Ionesco, a young and promising statesman) were all Conservatives, but the Government shared the fate of many previous administrations, and before it had been ten days in office was defeated in the Chambers on a vote of no confidence. M. Catargi, however, reconstituted his cabinet by the addition to it of Messrs Carp and Ghermani, prominent Junimists; Parliament was dissolved, and in the elections which followed the Conservative-Junimist coalition obtained a large majority.

The first year of the new administration was marked by the betrothal of Prince Ferdinand of Rumania to the Princess Maria, daughter of the duke of Coburg and the Grand Duchess Alexandra of Russia, and grand-daughter of Queen Victoria and of the Tsar Alexander: the betrothal was followed by a visit of King Charles to Queen Victoria at Windsor, on which occasion his majesty was invested with the order of the Garter. The marriage took place at Sigmaringen on the 10th January 1893. Prince Carol (born on the 15th October 1893) and the Princesses Elizabeth and Maria, the issue of this marriage, have been brought up in the Orthodox faith. The well-deserved affection of the country towards the dynasty was subsequently displayed during the dangerous illnesses from typhoid fever of Prince Ferdinand in 1897 and the young Prince Carol in 1899, when spontaneous expressions of sympathy poured in from all quarters.

The new ministry during their four years' tenure of office passed several useful measures through Parliament. The State credit was improved by the conversion of the public debt, the sale of the State lands to the peasantry was actively proceeded with, greatly assisted by the establishment of an agricultural bank founded by the Government with a capital of nearly a million sterling, for the purpose of making advances to the poorer landed classes; a rural gendarmerie was formed, a law was passed making irremovable the judges of the Court of Appeal and the presidents of the tribunals, and other important judicial reforms were carried out; a mining law was passed with the object of introducing foreign capital, and the commercial marine was developed by the formation of a State ocean service of passenger and cargo steamers. Great reforms, which had been unsuccessfully attempted by former Governments, were made in the service of public instruction and in the organization of the clergy. In 1893 and 1894 commercial and extradition treaties and a trade-mark convention were made with Great Britain. The commercial treaty with Great Britain, as well as similar treaties with Austria and Germany, were for a period of ten years, expiring in 1903. In May 1894 the king inaugurated with much ceremony the opening to navigation of a new waterway in the Sulina branch of the Danube, constructed by the European commission, and in September of the following year opened for traffic the magnificent railway bridge over the Danube at Tchernavoda (constructed by the Rumanian Government at a cost of about one and a half million sterling), which connects the whole of the Rumanian railway system with the port of Constantza, where a year later he laid the first stone of the new works destined to make that port a first-class harbour. Meanwhile the Liberal Opposition was being reorganized. On the death of John Bratiano his brother Demetrius was proclaimed chief of the united Liberal party, but he survived his brother only one year, and on his death in June 1892 the veteran statesman Demetrius Stourdza was recognized as the head of the National Liberal party. M. Stourdza had commenced his political career in 1857 as secretary to the divan *ad hoc* of Moldavia; in 1866 he was minister of public works, and in 1870 of finance. He had led the anti-dynastic agitation during Lascar Catargi's first ministry. In 1877 he was a strong opponent of the Russo-Rumanian alliance, but returned to power under Bratiano in 1878, and became a faithful defender of the dynasty and a strong partisan of the Triple Alliance. A man of great talent, tremendous application, and full of energy, he was the leading spirit of the most important financial institutions of the country, and was very popular in Liberal circles. In 1894 he started a very violent agitation in favour of the Rumanians of Transylvania and the Banat, who were being persecuted by their Magyar rulers after the unsuccessful attempt to present their famous "memorandum" to the Austrian emperor. Public meetings were held all over Rumania in favour of their oppressed countrymen. Interpellated in the Senate, the Government could only reply that they were unable to interfere in the internal affairs of a neighbouring state; and although they retained their parliamentary majority, they rapidly lost ground in public estimation. Another popular Opposition cry referring to internal matters was "Rumania for the Rumanians!" The new mining law, among other concessions, gave foreigners the right to lease lands for long periods for the working of petroleum, and this was denounced by the Opposition as being hostile to national interests, and also as being against the spirit of the constitution, which prohibited foreigners from holding lands. The Bill, in spite of the Opposition, was carried by the Government in April 1895, as well as another important measure favouring the construction of local railways by private individuals. The Liberal Opposition protested, and retired from the Chamber, and took no further part in legislative proceedings. The Liberal party had been out of office for eight years, the Conservative-Junimist coalition had practically carried out their complete programme, and legislation was at a deadlock owing to the abstention of the Liberal Opposition. The popular agitation against the Government was most violent, and the king thought it high time that there should be a change of ministry, and that the Liberal party should have its turn. The three Junimist members of the cabinet tendered their resignation, but Catargi undertook to carry on the Government if the king would grant an immediate dissolution of the Chambers, anticipating by a few months its constitutional term of four years. His majesty refused his consent; the Government resigned, and M. Stourdza was called on to form a new ministry.

In December Parliament was dissolved, and the elections took place under the auspices of M. Fleva, the new minister of the interior. In no so-called constitutional country in the world has the Government so much power in influencing the elections as in Rumania. On a change of ministry the first act of the new minister of the interior is to dismiss nearly all the prefects of the thirty districts into which the country is divided. (The Dobrudja, which consists of two additional districts, does not send any representatives to the Chamber.) The under-prefects share the same fate. The communal councils are then dissolved, and new provisional members appointed under Government pressure. Then follows the general election; and as all the executive officers are partisans of the Government, and are by no means scrupulous as to the means they employ, and as the hosts of officials scattered over the country almost invariably vote on the side of the Government, the result of the election can be foretold to a certainty. In the present case, although M. Fleva ostentatiously declared that there should be no official interference with the elections, there was the somewhat startling result that, whereas in the previous Parliament the Conservatives had an overwhelming majority in both houses, five Conservatives only were elected in the new Chamber, and two in the Senate. The advent to power of the Liberal party under M. Stourdza, who had recently been making such violent attacks on the Hungarian Government, caused some anxiety in Austria-Hungary, which was dispelled, however, by public declarations at Jassy and subsequent official explanations. When once office was obtained, it was to the interest of the new Government that the agitation should subside, and this was rendered comparatively

easy, as an amnesty had been granted to the political prisoners in Transylvania.

The official opening by the emperor of Austria of the new canal through the Iron Gates of the Danube on the 27th September 1896 (one of the episodes of the Hungarian "Millennium" festivities), was the means of bringing about a great improvement in the relations between the two countries. The kings of Rumania and Servia were the honoured guests of the emperor on this occasion, and immediately afterwards the emperor paid an official visit to King Charles at Bucharest, where great preparations had been made to give his imperial majesty a befitting reception. The improved relations which resulted from this exchange of courtesies between their sovereigns were unfortunately not of very long duration. In the following autumn King Charles paid a visit to the emperor at Budapest, the Hungarian capital—a visit which was intended further to cement the friendly feeling between their respective subjects; but, most unfortunately, the king of Rumania, in conferring numerous orders and decorations on the occasion of his visit, bestowed one, probably by an oversight, on a Hungarian official who was only known to fame as a very violent anti-Rumanian writer in the Magyar press. This incident was the signal for the reopening of an acrimonious newspaper war between the two countries, and the ill-feeling caused thereby had probably much to do with reconciling the Rumanians to a visit made by their sovereign in the following year (August 1898) to his other powerful neighbour, the Tsar. Accompanied by Prince Ferdinand and M. Stourdza, he was for a fortnight the emperor's guest at Moscow, Kieff, and St Petersburg. His reception everywhere was most cordial, on the part not only of the emperor, but also of the military, who had not forgotten that the king had commanded the Russian army before Plevna. This visit was the outward symbol of a reconciliation between the Rumanians and Russians—the relations between whom had been the reverse of cordial ever since the termination of the war of 1877–78, resulting as it did in the forcible alienation of Bessarabia from one country to the other. As regards foreign relations with other Powers during M. Stourdza's administration, it may be noted that diplomatic relations were renewed with Greece after an interruption of several years. The relations of the Government with Turkey were also very friendly, and a commercial convention was signed between the two countries; at the time of the Armenian troubles the entry of Armenian refugees into Rumanian territory was rigorously prevented, ostensibly on the grounds that the Government did not wish Bucharest to become the centre of a conspiracy against a neighbour. In the Greco-Turkish war, also, much sympathy was shown to Turkey, probably with the object of obtaining friendly treatment for the numerous Koutzo-Vlach population scattered over Turkey in Europe, but the friendliness shown by Rumania was not thoroughly reciprocated. The sultan would not grant the concessions she desired with regard to the nomination of an independent bishopric for the Vlach communities, and later on in 1900 the commercial treaty was denounced by Turkey, and Rumania lost the privilege of most favoured nation treatment and of the special tariff which had previously been accorded.

As regards home politics, the overwhelming majority of the Liberal party at the elections of 1895, instead of being a source of strength, proved the very reverse. It caused the party to split up into factions, Stourdzists, Aurelianists, and Flevists, so called after the names of their respective chiefs. M. Fleva, who now held office for the first time, after having battled in the Liberal cause for twenty years, was the first to quarrel with his chief, and had to leave the ministry after only a few months' tenure of office. He was replaced as minister of the interior by M. Statesco. Some months later, shortly after the visit of the emperor of Austria, M. Stourdza himself had to retire from office in circumstances which caused a great and painful sensation throughout the country. The head of the Orthodox Church, the Metropolitan Gennadius, who had formerly taken an active part in insisting that the younger members of Prince Ferdinand's family should be brought up in the Orthodox faith, had for some years past, as *ex-officio* head of the richly-endowed philanthropic establishments founded by the Princess Brancovan, been desirous of getting the entire management of these wealthy foundations into his own hands, and had made violent attacks on the two administrators, Prince George Bibescu and Prince Stirbey, both members of the Brancovan family. In the quarrel that ensued much that was questionable in the early career of the prelate was brought to light, and he was openly accused of simony, of heresy, and other matters more suitable for a criminal court. The scandal created was so great that the Government called on the metropolitan to resign, and on his refusal to do so ordered his arraignment before the Holy Synod, by whom, after a public trial, he was found guilty of certain canonical offences, and sentenced to be deposed from his high estate. The same night, by order of the head of the Government, he was seized in his archiepiscopal residence by the police, and removed by force to a neighbouring monastery. This harsh treatment of the head of the Church led to a tremendous outcry against M. Stourdza. Indignant meetings of protest were held throughout the country, and by no one was the prime minister more eloquently and vigorously denounced than by his late colleague M. Fleva. M. Stourdza had to yield before the storm, and on the 3rd December 1896 the president of the council, M. Aurelian, was called on to reconstitute a Liberal cabinet, with the principal object of calming public opinion by the settlement of this exciting question, which was putting a stop to parliamentary and all other business. M. B. Lascar Catargi, an able and experienced public servant, was called to the ministry of the interior. M. Aurelian then appealed to the patriotic sentiments of the Conservative party to help to solve the difficulty, and with the aid of Messrs Lascar Catargi and Tache Ionescu, after a long and anxious discussion, the following decision was arrived at:—The Holy Synod was to reverse its judgment (M. Ionescu, a clever lawyer, had discovered some technical flaw which would enable the members of the Synod, all more or less subservient to their political chiefs, to go through the somewhat humiliating process of reversing their first decision), and the metropolitan was to be restored to his ecclesiastical rank and dignities, which, after holding them for a few days, he was voluntarily to resign and to receive as compensation a handsome pension. This scheme was carried out to the letter, except that the metropolitan did not receive his pension until the year 1899, when the Conservatives were again in power.

Calm was restored in the country. Monsignor Joseph Gheorgian, who had previously held the same high office, but who had retired into private life, was re-elected metropolitan, and the Liberal party was again torn by intestine quarrels. M. Aurelian and his colleagues having tasted the sweets of office, were not inclined to hand over their portfolios to M. Stourdza and his partisans. The struggle terminated in the success of M. Stourdza, who in April 1897 returned to power and remained president of the council until 1899. The discords among the Liberal party prevented the carrying out of the extensive projects of reform that had been promised by M. Stourdza's Government on its first accession to power, and but few important measures were passed—one for the reform of public instruction being the most noteworthy. The Liberal Government abstained from putting into force the mining law passed in 1895, and it remained a dead letter until the Conservatives came back into power in 1899. The Rumanian mercantile marine was expanded by the organization of a line of cargo steamers belonging to the Government to run between the Danube and Rotterdam, and considerable progress was made in the extension of railways and other public works, notably those at the port of Constantza. M. Stourdza's Government, which had risen to power mainly on the national question, was also destined to fall on it. A tremendous popular agitation was raised on the subject of certain subsidies made by the Rumanians for the support of the Rumanian schools at Kronstadt in Transylvania, and M. Stourdza was accused of too great subserviency to the Hungarian Government. The agitation culminated in street riots at Bucharest. On the same evening that M. Stourdza tendered his resignation to the king (April 1899) the veteran Conservative statesman Lascar Catargi suddenly died; and it is said that the king was preparing a summons to him to form a new ministry when the news arrived at the palace. The Conservative party held a hurried meeting, and without consulting M. Carp (the leader of the Junimist party, who had for so many years acted as a colleague of M. Catargi), they elected as their chief M. G. Gr. Cantacuzene, a gentleman of great wealth and highly respected, but not by any means a brilliant statesman. He was called on by the king to form a ministry. The Junimists, feeling hurt by the action of the Conservative party, declined to take any part in it, and M. Cantacuzene ultimately formed a ministry composed of five pure Conservatives—himself, the veteran General Manu, Tache Ionescu, General Jaques Lahovary, and his brother Jean, and four recruits from the Independent Liberal party, Messrs Fleva, Istrati, Disescu, and Gradishteanu, who now formally rallied to the Conservative party. The new ministry was hardly in office when serious agrarian riots broke out in the Olt district in Wallachia, due in great measure to Socialistic agitation. The Government acted energetically, and the revolt was promptly suppressed by the military, but not before many of the misguided peasants had paid the penalty of their folly with their lives.

In the new Chamber of Representatives elected after the change of Government there were 149 Conservatives, 13 Junimists, and 7 Liberals. But the Conservative administration had a heavy task before it, and the years 1899–1900 will long be remembered in Rumania for the economical and financial crises through which it passed, owing principally to the disastrous failure of the harvest of 1899, which caused so much distress among the poorer classes that in the autumn several thousand emigrants left the Dobrudja for foreign countries, and in 1900 at least 5000 Jews emigrated from Moldavia. The financial position of the country had hitherto on the surface been very satisfactory. The public debt, mostly placed in Germany, amounted to about 51 millions sterling, of which the interest had been regularly paid, but the facility with which money had always been borrowed gave rise to great extravagance. Expenses which ought to have been defrayed out of the ordinary budget, such

as material for railways, construction of roads and public buildings (especially in the erection, regardless of expense, of magnificent public offices at Bucharest), equipment and ammunition for the army, &c., were frequently defrayed out of the produce of the loans, and the custom had arisen when money was scarce of issuing treasury bonds. When the Conservative Government came into office they found that the payment of 2½ millions of these bonds would shortly become due, and there were no resources in the treasury to meet them. Owing to the Transvaal war and other causes the money market was most unfavourable, especially in Germany, where their loans had always hitherto been negotiated. To add to their difficulties, there was an almost entire failure of the harvest, and a certainty of a large deficit in the ordinary budget for 1898-99, since estimated at £1,200,000. The value of cereals exported in 1898 was about 9 millions sterling, in 1899 only 3½ millions; and when it is recollected that the railways and navigation services are all State property, and that the State is also the owner of the tobacco, salt, and other monopolies, which bring in on an average year some 2¼ millions, it may well be imagined that the failure of the harvest, which affects materially all these as well as other sources of revenue, is a tremendous blow to the financial position of the country. The Government managed to extricate itself from its immediate difficulties by raising a loan at Berlin of 9 millions sterling in the autumn of 1899, but on very stringent terms. Besides paying a much higher rate of interest than heretofore, it bound itself not to contract any further new loans until this one was paid off. The budget for 1900-1901, after allowing for the increase of the public debt, showed a nominal surplus of about £280,000 in a total of close on 10 millions, the expenditure of the country having nearly doubled in ten years. To balance the budget new taxes were levied to the extent of £750,000, some of which caused great discontent, notably a tax on *tzuica* or plum brandy, the injudicious and premature application of which provoked serious riots among the peasantry in the districts concerned, which were not suppressed without loss of life. The Conservative Government during its tenure of office passed several useful measures, and did one very substantial service to the country in settling by an amicable compromise with the Hungarian Government the long-vexed question concerning the subsidy granted by Rumania to the national schools at Kronstadt. The Hungarian Government, through its prime minister, M. Szell, openly announced its intention of inaugurating a more just and liberal policy towards the Rumanians of Transylvania and the Banat.

In the summer of 1900 the financial crisis was so acute that it was generally felt that M. Cantacuzene's ministry was not strong enough to cope with it. Secret negotiations took place between the Junimists and some of the Conservative ministers, the outcome of which was a public declaration of the fusion of the old and new Conservatives into one united Conservative party. M. Cantacuzene resigned the presidency of the council, although remaining the nominal head of the party, and M. Carp, who had been the leader of the Junimists, was called on by the king to form a new ministry. General Lahovary and Gradishteanu retained their portfolios. Olanescu was given the interior, and Marghiloman the ministry of foreign affairs. Messrs Arion, Filipescu, and Maiorescu were appointed ministers of public instruction, the domains, and justice, while M. Carp himself took the department of finance. Later on in the year the various factions of the Liberal party also decided to combine as National Liberals under the leadership of the veteran Stourdza. But the new ministry, which had come into power by intrigue, was soon destined to fall in the same way. One formidable adversary, the ex-demagogue and late Conservative minister, M. Fleva, had been got out of the way by being appointed to the Rumanian legation at Rome, but General Manu, M. Tache Ionescu, and M. Lahovary, other members of the late ministry, remained. They had been passed over and ignored at the time of the Conservative fusion, but soon made their power felt. The Conservatives as a whole were united in wishing to meet the financial crisis by a moderate reduction of the expenditure and a large increase of taxation, while M. Stourdza and the Liberal Opposition advocated the permanent reduction of the annual expenditure by 20,000,000 francs, which would necessitate the raising of 5,000,000 only by fresh taxation. The Conservative ex-ministers, who had a large following in the Chambers, formed a majority in the budget committee of the house, and strenuously opposed some of M. Carp's financial proposals, notably a largely increased tax on professions. The premier, unable to have his way, resigned in February 1901, and M. Cantacuzene was again called on to form a ministry, but being unable to obtain the adherence of any members of M. Carp's ministry, declined the task. A truce was agreed on and M. Carp returned to power, but only for a few days. M. Stourdza delivered a very violent speech in the Senate, attacking several of the members of M. Cantacuzene's ministry, and M. Carp, replying to an interpellation in the Chambers, declined to defend them or to accept responsibility for their past proceedings. This proved too great a strain on the loyalty of the ex-ministers and their followers, and on the 25th February the Chamber of Deputies, after a stormy sitting, rejected by 75 votes to 74 a vote of confidence in the financial policy of the Government. The majority was composed of dissenting Conservatives and of Liberals, who had, however, only eight seats in the house. M. Carp again resigned, and as the Conservatives, through party dissensions, had proved themselves quite incapable of dealing with the financial crisis, the king decided to entrust M. Stourdza with the formation of a Liberal ministry. He was summoned on the morning of the 26th, completed the ministerial list by the evening, and on the following morning (*i.e.*, within 40 hours of the passing of the hostile resolution in the Chamber) read the king's decree dissolving both the Chamber of Deputies and the Senate.

(H. TR.)

Rumburg, the chief town of a government district in Bohemia, Austria, on the Saxon frontier, with Saxon and Austrian custom-houses. Important industrial centre, with textile industry (linen, woollen, and cotton goods, sewing thread, &c.), turnery in horn, dyeing, corn-milling, &c. Population (1890), 10,178; (1900), 10,382, all German and chiefly Roman Catholic (estimated at 3 per cent. Protestant, 1 per cent. Old Catholic, and 1 per cent. Jewish).

Runcorn, a market town and seaport, Cheshire, England, in the Northwich parliamentary division, 15 miles north-east of Chester by rail, on the south side of the Mersey. Several places of worship have been enlarged, and among new buildings are a Catholic church, seamen's institute, church house, technical institute, and free library. Runcorn is a sub-port of Manchester, with which it is connected by the Manchester Ship Canal, and has extensive wharfage and warehouse accommodation. The chief exports are coal, salt, and pitch; but there is also a large traffic in potters' materials (such as bone ash, china clay, flints, &c.), also a miscellaneous one in slates, pig-iron, ochre, and amber. A transporter bridge between Runcorn and Widnes, with a suspended car worked by electricity to convey passengers and vehicles from one side of

the river to the other—the first bridge of the kind in England—was constructed in 1902. Population of parish and urban district (1891), 20,050; (1901), 16,491.

Rupar, a town of British India, in the Umballa district of the Punjab, on the left bank of the river Sutlej, 43 miles north of Umballa; 1120 feet above the sea. Population (1881), 10,326; (1891), 8693; municipal income (1897–98), Rs.11,038. It is historically interesting as the scene of Ranjit Singh's visit to Lord William Bentinck when governor-general in 1831. Here are the head works of the Sirhind canal. It is also a centre of local trade, and has manufactures of cotton cloth and hardware. Hindu and Mahommedan fairs are held.

Rupert's Land. See North-West Territories.

Ruskin, John (1819–1900), was born in London, at Hunter Street, Brunswick Square, on 8th February 1819, being the only child of John James Ruskin and Margaret Cox. They were Scots, first cousins, the grandchildren of a certain John Ruskin, of Edinburgh (1732–1780). In *Præterita* the author professes small knowledge of his ancestry. But the memoirs published on the authority of the family trace their descent to the Adairs and Agnews of Galloway. In this family tree are men famous in arms and in the public service: Sir Andrew Agnew of Lochnaw, Admiral Sir John Ross, Field-Marshal Sir Hew Dalrymple Ross, Dr John Adair, in whose arms Wolfe died at Quebec, and the Rev. James Tweddale of Glenluce, to whom the original Covenant, now in the Glasgow Museum, had been confided. The name Ruskin is said to be a variant of Erskine, or Roskeen, or Rogerkin, and even Roughskin. It is more probably Rusking, an Anglian family, which passed northwards and became Ruskyn, Rusken, and Ruskin.

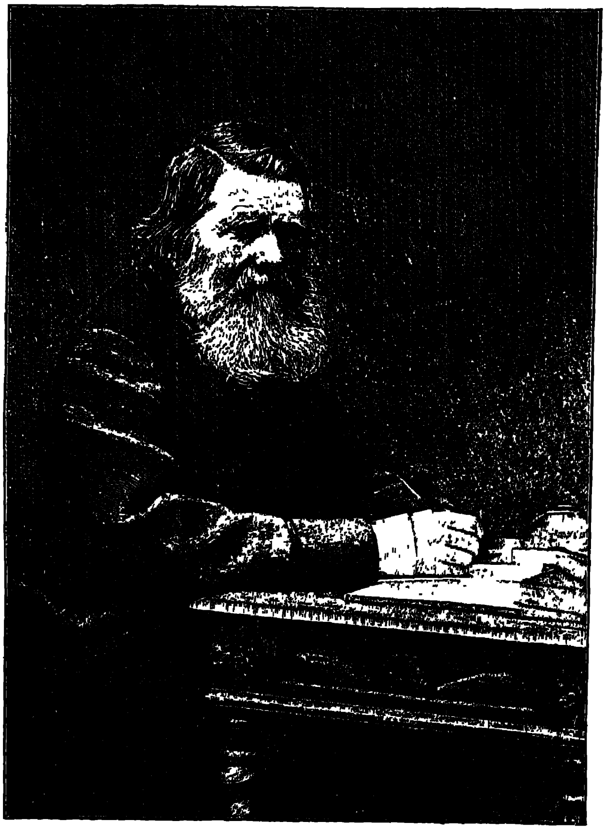
John Ruskin, the author's grandfather, a handsome lad of twenty, ran away with Catherine Tweddale, daughter of the Covenanting minister and of Catherine Adair, then a beautiful girl of sixteen. He settled in Edinburgh and engaged in the wine trade, lived liberally in the cultivated society of the city, lost his health and his fortune, and ended his days in debt. His son, John James Ruskin (1785–1864), father of the author, was sent to the High School at Edinburgh under Dr A. Adam, received a sound classical education, and was well advised by his friend Dr Thomas Brown, the eminent metaphysician. When of age, John James was sent to London to enter the wine trade. There, in 1809, he founded the sherry business of Ruskin, Telford, and Domecq; Domecq being proprietor of a famous vineyard in Spain, Telford contributing the capital of the firm, and Ruskin having sole control of the business. John James Ruskin, a typical Scot, of remarkable energy, probity, and foresight, built up a great business, paid off his father's debts, formed near London a most hospitable and cultured home, where he maintained his taste for literature and art, and lived and died, as his son proudly wrote upon his tomb, "an entirely honest merchant." He was also a man of strong brain, generous nature, and fine taste. After a delay of nine years, having at last obtained an adequate income, he married his cousin, Margaret Cox, who had already lived for eighteen years with his mother, the widow of John Ruskin of Edinburgh. When this marriage of the two cousins, who had known each other all their lives, took place in 1818, neither of them was young. John James was thirty-three and Margaret was thirty-seven. In the following year (8th February 1819) their only child, John, was born in Hunter Street, London.

Margaret Ruskin, the author's mother, was a handsome, strong, stern, able, devoted woman of the old Puritan school, Calvinist in religion, unsparing of herself and others, rigid in her ideas of duty, proud, reserved, and ungracious. She was the daughter of Captain Cox, of Yarmouth, master mariner in the herring fishery, who died young; whereupon his widow maintained herself as landlady of the King's Head Inn at Croydon. Her younger daughter married Mr Richardson, a baker, of Croydon; the elder, Margaret, married John James Ruskin. Jessie, a sister of John James, married Peter Richardson, a tanner, of Perth, so that the author had cousins of two Richardson families, unconnected with each other. In his own memoirs he speaks much more of these than of any Ruskins, Tweddales, Adairs, or Agnews. The child was brought up under a rigid system of nursing, physical, moral, and intellectual; kept without toys, not seldom whipped, watched day and night, but trained from infancy in music, drawing, reading aloud, and observation of natural objects. When he was four the family removed to a house on Herne Hill, then a country village, with a garden and rural surroundings. The father, who made long tours on business, took his wife, child, and nurse year after year across England as far as Cumberland and Scotland, visiting towns, cathedrals, castles, colleges, parks, mountains, and lakes. At five the child was taken to Keswick; at six to Paris, Brussels, and Waterloo; at seven to Perthshire. At fourteen he was taken through Flanders, along the Rhine, and through the Black Forest to Switzerland, where he first imbibed his dominant passion for the Alps. His youth was largely passed in systematic travelling in search of everything beautiful in nature or in art. And to one so precocious, stimulated by a parent of much culture, ample means, and great ambition, this resulted in an almost unexampled æsthetic education. In childhood also he began a systematic practice of composition, both in prose and verse. His mother trained him in reading the Bible, of which he read through every chapter of every book year by year; and to this study he justly attributes his early command of language and his pure sense of style. His father read to him Shakespeare, Scott, Don Quixote, Pope, and Byron, and most of the great English classics; and his attention was especially turned to the formation of sentences and to the rhythm of prose. He began to compose both in prose and verse as soon as he had learned to read and write, both of which arts he taught himself by the eye.

His first letter is dated 1823, when he was only four. In it he corrects his aunt, who had put up the wooden pillars of his Waterloo bridge "upside down." At five he was a bookworm. At seven he began a work in four volumes, with "copper-plates printed and composed by a little boy, and also drawn." His first poem, correct in rhyme and form, was written before he was seven. At nine he began "Eudosia, a poem of the Universe." From that year until his Newdigate Prize, at the age of twenty, he wrote enormous quantities of verse, and began dramas, romances, and imitations of Byron, Pope, Scott, and Shelley. What remain of these effusions have no special quality except good sense, refined feeling, accuracy of phrase, and a curious correctness of accent and rhythm. Of true poetry in the higher sense there is hardly a single line.

His schooling was irregular and not successful. At the age of eleven he was taught Latin and Greek by Dr Andrews, a scholar of Glasgow University. About the same time he had lessons in drawing and in oil painting from Runciman. French and Euclid were taught by Rowbotham. At fifteen he was sent for two years to the day school of the Rev. T. Dale of Peckham, and at seventeen he attended some courses in literature at King's College, London. In painting he had lessons from Copley Fielding and afterwards from Harding. But in the incessant

travelling, drawing, collecting specimens, and composition in prose and verse he had gained but a very moderate classical and mathematical knowledge when he matriculated at Oxford; nor could he ever learn to write tolerable Latin. As a boy he was active, lively, and docile; a good walker, but ignorant of all boyish games, as naïf and as innocent as a child; and he never could learn to dance or to ride. He was only saved by his intellect and his fine nature from turning out an arrant prig. He was regarded by his parents, and seems to have regarded himself, as a genius. As a child he had been "a savant in petticoats"; as a boy he was a poet in breeches. At the age of seventeen he saw Adèle, the French daughter of Monsieur Domecq, Mr Ruskin's partner, a lovely girl of fifteen. John fell rapturously in love with her; and, it seems, the two fathers seriously contemplated their marriage. The young poet wooed the girl with poems, romances, dramas, and mute worship, but received nothing except chilling indifference and lively ridicule. To the gay young beauty, familiar with Parisian society, the raw and serious youth was not a possible *parti*. She was sent to an English school, and he occasionally saw her. His unspoken passion lasted about three years, when she married the Baron Duquesne. Writing as an old man, long after her death, Ruskin speaks of his early love without any sort of rapture. But it is clear that it deeply coloured his life, and led to the dangerous illness which for some two years interrupted his studies and made him a wanderer over Europe.



JOHN RUSKIN.
(From a photograph by Barraud, London.)

As the father was resolved that John should have everything that money and pains could give, and was one day to be a bishop at least, he entered him at Christ Church, Oxford, as a gentleman-commoner—then an order reserved for men of wealth and rank. Ruskin's Oxford career, broken by the two years passed abroad, was not very full of incident or of usefulness. Though he never became either a scholar or a mathematician, he did enough accurate work to be placed in the honorary fourth class both in classics and in mathematics. By the young bloods of the "House" he was treated pleasantly as a raw outsider of genius. By some of the students and tutors, by Liddell, Newton, Acland, and others, he was regarded as a youth of rare promise, and he made some lifelong friendships with men of mark and of power. Both he and his college took kindly the amazing proceeding of his mother, who left her husband and her home to reside in Oxford, that she might watch over her son's health. The one success of his Oxford career was the winning the Newdigate Prize by his poem "Salsette and Elephanta," which he recited in the Sheldonian Theatre (June 1839). Two years of ill-health and absence from home ensued. And he did not become "a Graduate of Oxford" until 1842, in his twenty-fourth year, five years after his first entrance at the University.

In fact, his desultory school and college life had been little more than an interruption and hindrance to his real education—the study of nature, of art, and of literature. Long before Ruskin published books he had appeared in print. In March 1834, when he was but fifteen, Loudon's *Magazine of Natural History* published an essay of his on the strata of mountains and an inquiry as to the colour of the Rhine. He then wrote for Loudon's *Magazine of Architecture*, and verses of his were inserted in Messrs Smith and Elder's *Friendship's Offering*, by the editor, T. Pringle, who took the lad to see the poet Rogers. At seventeen he wrote for *Blackwood* a defence of Turner, which the painter, to whom it was first submitted, did not take the trouble to forward to the magazine. At eighteen he wrote a series of papers, signed Kata Phusin, *i.e.* "after Nature," for Loudon's *Magazine*, on "The Poetry of Architecture." In 1838 (he was then nineteen) Mr Loudon wrote to the father, "Your son is the greatest natural genius that ever it has been my fortune to become acquainted with."

Having recovered his health and spirits by care and foreign travel, and having taken his degree and left Oxford, Ruskin set to work steadily at Herne Hill on the more elaborate defence of Turner, which was to become his first work. *Modern Painters*, vol. i., by "a Graduate of Oxford," was published May 1843, when the author was little more than twenty-four. It produced a great and immediate sensation. It was vehemently attacked by the critics, and coolly received by the painters. Even Turner was somewhat disconcerted; but the painter was now known to both Ruskins, and they freely bought his pictures. The family then went again to the Alps, that John might study mountain formation and "Truth" in landscape. In 1845 he was again abroad in Italy, working on his *Modern Painters*, the second volume of which appeared in 1846. He had now plunged into the study of Bellini and the Venetian school, Fra Angelico and the early Tuscans, and he visited Lucca, Pisa, Florence, Padua, Verona, and Venice, passionately devoting himself to architecture, sculpture, and painting in each city of North Italy. He wrote a few essays for the *Quarterly Review* and other periodicals, and in 1849 (*æt.* 30) he published *The Seven Lamps of Architecture*, with his own etchings, which greatly increased the reputation acquired by his *Modern Painters*.

On the 10th April 1848, a day famous in the history of Chartism, Ruskin was married at Perth to Euphemia C. Gray, a lady of great beauty, of a family long intimate with the Ruskins. The marriage, we are told, was arranged by the parents of the pair, and was a somewhat hurried act. It was evidently ill-assorted, and brought no happiness to either. They travelled, lived in London, saw society, and attended a "Drawing-room" at Buckingham

Palace. But Ruskin, immersed in various studies and projects, was no husband for a brilliant woman devoted to society. No particulars of their life have been made public. In 1854 his wife left him, obtained a nullification of the marriage under Scots law, and ultimately became the wife of John Everett Millais. John Ruskin returned to his parents, with whom he resided till their death; and neither his marriage nor the annulling of it seems to have affected seriously his literary career.

Ruskin's architectural studies, of which *The Seven Lamps* was the first fruit, turned him from Turner and *Modern Painters*. He planned a book about Venice in 1845, and *The Stones of Venice* was announced in 1849 as in preparation. After intense study in Italy and at home, early in 1851 (the year of the Great Exhibition in London) the first volume of *The Stones of Venice* appeared (*æt.* 32). It was by no means a mere antiquarian and artistic study. It was a concrete expansion of the ideas of *The Seven Lamps*—that the buildings and art of a people are the expression of their religion, their morality, their national aspirations and social habits. It was, as Carlyle wrote to the author, "a *sermon* in stones," "a singular sign of the times," "a new *Renaissance.*" It appeared in the same year with the *Construction of Sheepfolds*—a plea for the reunion of Christian churches—in the same year with the essay on *Pre-Raphaelitism*, the year of Turner's death (19th December). *The Stones of Venice* was illustrated with engravings by some of the most refined artists of his time. The author spent a world of pains in having these brought up to the highest perfection of the reproductive art, and began the system of exquisite illustration, and those facsimiles of his own and other sketches, which make his works rank so high in the catalogues and price-lists of collectors. This delicate art was carried even farther in the later volumes of *Modern Painters* by the school of engravers whom Ruskin inspired and gathered round him. And these now rare and coveted pieces remain to rebuke us for our modern preference for the mechanical and unnatural *chiaroscuro* of photogravure—the successor and destroyer of the graver's art. Although Ruskin was practised in drawing from the time that he could hold a pencil, and had lessons in painting from some eminent artists, he at no time attempted to paint pictures. He said himself that he was unable to compose a picture, and he never sought to produce anything that he would call a work of original art. His drawings, of which he produced an enormous quantity, were always intended by himself to be studies or memoranda of buildings or natural objects precisely as they appeared to his eye. Clouds, mountains, landscapes, towers, churches, trees, flowers, and herbs were drawn with wonderful precision, minuteness of detail, and delicacy of hand, solely to recall some specific aspect of nature or art, of which he wished to retain a record. In his gift for recording the most subtle characters of architectural carvings and details, Ruskin has hardly been surpassed by the most distinguished painters.

In 1853 *The Stones of Venice* was completed at Herne Hill, and he began a series of *Letters* and *Notes* on pictures and architecture. In this year (*æt.* 34) he opened the long series of public lectures wherein he came forward as an oral teacher and preacher, not a little to the alarm of his parents and amidst a storm of controversy. The Edinburgh Lectures (November 1853) treated Architecture, Turner, and Pre-Raphaelitism. The Manchester Lectures (July 1857) treated the moral and social uses of art, now embodied in *A Joy for Ever*. Some other lectures are reprinted in *On the Old Road* and *The Two Paths*, 1859. These lectures did not prevent the issue of various *Notes* on the Royal Academy pictures and the Turner collections; works on the *Harbours of England*, 1856; on the *Elements of Drawing*, 1857; the *Elements of Perspective*, 1859. And at last, after prolonged labour, the fifth and final volume of *Modern Painters* was published in 1860 (*æt.* 41). This marks an epoch in the career of John Ruskin; and the year 1860 closed the series of his works on art strictly so called; indeed, this was the last of his regular works in substantial form. The last forty years of his life were devoted to expounding his views, or rather his doctrines, on social and industrial problems, on education, morals, and religion, wherein art becomes an incidental and instrumental means to a higher and more spiritual life. And his teaching was embodied in an enormous series of *Lectures*, *Letters*, *Articles*, *Selections*, and serial pamphlets. These are now collected in upwards of thirty volumes in the final edition. The entire set of Ruskin's publications amounts to more than fifty works having distinctive titles. For some years before 1860 Ruskin had been deeply stirred by reflecting on the condition of all industrial work and the evils of modern society. His lectures on art had dealt bitterly with the mode in which buildings and other works were produced. In 1854 he joined Mr F. D. Maurice, Mr T. Hughes, and several of the new school of painters, in teaching classes at the Working Men's College. But it was not until 1860 that he definitely began to propound a new social scheme, denouncing the dogmas of political economy. Four lectures on this topic appeared in the *Cornhill Magazine*, until the public disapproval led the editor, then W. M. Thackeray, to close the series. They were published in 1862 as *Unto this Last*. In the same year he wrote four papers in the same sense in *Fraser's Magazine*, then edited by J. A. Froude; but he in turn was compelled to suspend the issue. They were completed and ultimately issued under the title *Munera Pulveris*. These two small books contain the earliest and most systematic of all Ruskin's efforts to depict a new social Utopia: they contain a vehement repudiation of the orthodox formulas of the economists; and they are for the most part written in a trenchant but simple style, in striking contrast to the florid and discursive form of his works on art.

In 1864 Ruskin's father died, at the age of 79, leaving his son a large fortune and a fine property at Denmark Hill. John still lived there with his mother, aged 83, infirm, and failing in sight, to whom came as a companion their cousin, Joanna Ruskin Agnew, afterwards Mrs Arthur Severn. At the end of the year 1864 Ruskin delivered at Manchester a new series of lectures—not on art, but on reading, education, woman's work, and social morals—the expansion of his earlier treatises on economic sophisms. This afterwards was included with a Dublin lecture of 1868 under the fantastic title of *Sesame and Lilies* (perhaps the most popular of his social essays), of which 44,000 copies were issued down to 1900. He made this, in 1871, the first volume of his collected lectures and essays, the more popular and didactic form of his new Utopia of human life. It contains, with *Fors*, the most complete sketch of his conception of the place of woman in modern society. In the very characteristic preface to the new edition of 1871 he proposes never to reprint his earlier works on art; disclaims many of the views they contained, and much in their literary form; and specially regrets the narrow Protestantism by which they were pervaded. In the year 1866 he published a little book about girls, and written for girls, a mixture of morals, theology, economics, and geology, under the title of *Ethics of the Dust*; and this was followed by a more important and popular work, *The Crown of Wild Olive*. This in its ultimate form contained lectures on "Work," "Traffic," "War," and

the "Future of England." It is one of his most trenchant utterances, full of fancy, wit, eloquence, and elevated thought. But a more serious volume was *Time and Tide* (1867), a series of twenty-five letters to a workman of Sunderland upon various points in the Ruskinian Utopia. This little collection of "Thoughts," written with wonderful vivacity, ingenuity, and fervour, is the best summary of the author's social and economic programme, and contains some of his wisest and finest thoughts in the purest and most masculine English that he had at his command. In 1869 he issued the *Queen of the Air*, lectures on Greek myths, a subject he now took up, with some aid from the late Sir C. Newton. It was followed by some other occasional pieces; and in the same year he was elected Slade professor of art in the University of Oxford. He now entered on his professorial career, which continued with some intervals down to 1884, and occupied a large part of his energies. His lectures began in February 1870, and were so crowded that they had to be given in the Sheldonian Theatre, and frequently were repeated to a second audience. He was made honorary fellow of Corpus Christi, and occupied rooms in the college. In 1871 his mother died, at the age of 90, and his cousin, Miss Agnew, married Mr Arthur Severn. In that year he bought from Mr Linton, Brantwood, an old cottage and property on Coniston Lake, a lovely spot facing the mountain named the Old Man. He added greatly to the house and property, and lived in it continuously until his death in 1900. In 1871, one of the most eventful years of his life, he began *Fors Clavigera*, a small serial addressed to the working men of England, and published only by Mr George Allen, engraver, at Keston in Kent, at 7d., and afterwards at 10d., but without discount, and not through the trade. This was a medley of social, moral, and religious reflections interspersed with casual thoughts about persons, events, and art. *Fors* means alternatively Fate, Force, or Chance, bearing the *Clavis*, Club, Key, or Nail, *i.e.*, power, patience, and law. It was a desultory exposition of the Ruskinian ideal of life, manners, and society, full of wit, play, invective, and sermons on things in general. It was continued with intervals down to 1884, and contained ninety-six letters or pamphlets, partly illustrated, which originally filled eight volumes and are now reduced to four.

The early years of his Oxford professorship were occupied by severe labour, sundry travels, attacks of illness, and another cruel disappointment in love. In spite of this, he lectured, founded a museum of art, to which he gave pictures and drawings and £5000; he sought to form at Oxford a school of drawing; he started a model shop for the sale of tea, and model lodgings in Marylebone for poor tenants. At Oxford he set his pupils to work on making roads to improve the country. He now founded "St George's Guild," himself contributing £7000, the object of which was to form a model industrial and social movement, to buy lands, mills, and factories, and to start a model industry on co-operative or Socialist lines. In connexion with this was a museum for the study of art and science at Sheffield. Ruskin himself endowed the museum with works of art and money; a full account of it has been given in Mr E. T. Cook's *Studies in Ruskin* (1890), which contains the particulars of his University lectures and of his economic and social experiments. It is unnecessary to follow out the history of these somewhat unpromising attempts. None of them came to much good, except the Sheffield museum, which is an established success, and is now transferred to the town. In *Fors*, which was continued month by month for seven years, Ruskin poured out his thoughts, proposals, and rebukes on society and persons with inexhaustible fancy, wit, eloquence, and freedom, until he was attacked with a violent brain malady in the spring of 1878 (*æt.* 59); and, although he recovered in a few months sufficiently to do some occasional work, he resigned his professorship early in 1879. The next three years he spent at Brantwood, mainly in retirement, and unhappy in finding nearly all his labours interrupted by his broken health. In 1880 he was able to travel in northern France, and began the *Bible of Amiens*, finished in 1885; and he issued occasional numbers of *Fors*, the last of which appeared at Christmas 1884. In 1882 he had another serious illness, with inflammation of the brain; but he recovered sufficiently to travel to his old haunts in France and Italy—his last visit. And in the following year he was re-elected professor at Oxford and resumed his lectures; but increasing brain excitement, and indignation at the establishment of a laboratory to which vivisection was admitted, led him to resign his Oxford career, and he retired in 1884 to Brantwood, which he never left. He now suffered from frequent attacks of brain irritation and exhaustion, and had many causes of sorrow and disappointment. His lectures were published at intervals from 1870 to 1885 in *Aratra Pentelici*, *The Eagle's Nest*, *Love's Meinie*, *Ariadne Florentina*, *Val d'Arno*, *Proserpina*, *Deucalion*, *The Laws of Fesolê*, *The Bible of Amiens*, *The Art of England*, and *The Pleasures of England*, together with a series of pamphlets, letters, articles, notes, catalogues, and circulars.

In the retirement of Brantwood he began his last work, *Præterita*, a desultory autobiography with personal anecdotes and reminiscences. He was again attacked with the same mental malady in 1885, which henceforth left him fit only for occasional letters and notes. In 1887 it was found that he had exhausted (spent, and given away) the whole of the fortune he had received from his father, amounting, it is said, to something like £200,000; and he was dependent on the vast and increasing sale of his works, which produced an average income of £4000 a year, and at times on the sale of his pictures and realizable property. In 1872 a correspondent had remonstrated with him in vain as to taking "usury," *i.e.*, interest on capital lent to others for use. In 1874 Ruskin himself had begun to doubt its lawfulness. In 1876 he fiercely assailed the practice of receiving interest or rent, and he henceforth lived on his capital, which he gave freely to friends, dependants, public societies, charitable and social objects. The course of his opinions and his practice is fully explained in successive letters in *Fors*. Until 1889 he continued to write chapters of *Præterita*, which was designed to record memories of his life down to the year 1875 (*æt.* 56). It was, in fact, only completed in regular series down to 1858 (*æt.* 39), with a separate chapter as to Mrs Arthur Severn, and a fragment called *Dilecta*, containing letters and early recollections of friends, especially of Turner. These two books were published between 1885 and 1889; and except for occasional letters, notes, and prefaces, they form the last writings of the author of *Modern Painters*. His literary career thus extends over fifty years. But he has left nothing more graceful, naïf, and pathetic than his early memories in *Præterita*—a book which must rank with the most famous "Confessions" in any literature. The last ten years of his life were passed in complete retirement at Brantwood, in the loving care of the Severn family, to whom the estate was transferred, with occasional visits from friends, but with no sustained work beyond correspondence, the revision of his works, and a few notes and prefatory words to the books of others. He wished to withdraw his early art writings from circulation, but the public

demand made this practically impossible. And now the whole of his writings are under the control of Mr George Allen, in several forms and prices, including a cheap series at 5s. per volume.

The close of his life was one of entire peace and honour. He was loaded with the degrees of the universities and membership of numerous societies and academies. "Ruskin Societies" were founded in many parts of the kingdom. His works were translated and read abroad, and had an enormous circulation in Great Britain and the United States. Many volumes about his career and opinions were issued in his lifetime both at home and abroad. His 80th birthday, 8th February 1899, was celebrated by a burst of congratulations and addresses, both public and private. His strength failed gradually: his mind remained feeble but unclouded, and his spirit serene. An attack of influenza struck him down, and carried him off suddenly after only two days' illness, 20th January 1900. He was buried in Coniston churchyard by his own express wish, the family refusing the offer of a grave in Westminster Abbey.

Any complete bibliography of Ruskin's writings would demand more space than can be admitted in this sketch of his life. It is moreover unnecessary, since the admirable and copious catalogues which exist—(1) that by Thomas J. Wise and J. P. Smart, London, 1889-93; (2) that summarized, in 13 pp., by Mr W. G. Collingwood in his *Life*, London, 1900; and lastly, Mr George Allen's *List*, July 1900 (pp. 5-17)—are all easily accessible. Much less is any criticism of his works either needed or possible in this sketch. The enormous bulk of his writings and their curious range of topic make any complete review of them impracticable. His literary life may be arranged in three divisions. From 1837 to 1860 (*æt.* 18 to 41) he was occupied mainly with the arts. From 1860 to 1871 (*æt.* 41 to 52) he was principally occupied with social problems. From 1871 to 1885 (*æt.* 52 to 66) he was again drawn back largely to art by his lectures as professor, whilst prosecuting his social Utopia by speech, pen, example, and purse. But the essential break in his life was in 1860, which marks the close of his main works on art and the opening of his attempt to found a new social gospel. With regard to his views of art, he himself modified and revised them from time to time; and it is admitted that some of his judgments are founded on imperfect study and personal bias. But the essence of his teaching has triumphed in effect, and has profoundly modified the views of artists, critics, and the public, although it is but rarely accepted as complete or final. The moral of his teaching—that all living art requires *truth, nature, purity, earnestness*—has now become the axiom of all æsthetic work or judgment. John Ruskin founded the Reformation in Art.

With regard to his economic and social ideas there is far less general concurrence, though the years that have passed since *Unto this Last* appeared have seen the practical overthrow of the rigid plutonomy which he denounced. So, too, the vague and sentimental Socialism which pervades *Munera Pulveris, Time and Tide*, and *Fors* is now very much in the air, and represents the aspirations of many energetic reformers. But the negative part of Ruskin's teaching on economics, social and political problems, has been much more effective than the positive part of his teaching. It must be admitted that nearly the whole of his practical experiments to realize his dreams have come to nothing, which is not unnatural, seeing his defiance of the ordinary habits and standards of the world. A more serious defect was his practice of violently assailing philosophers, economists, and men of science, of whom he knew almost nothing, and whom he perversely misunderstood; men such as Adam Smith, Comte, Mill, Spencer, Darwin, and all who followed them. In art, Ruskin had enjoyed an unexampled training, which made him a consummate expert. In philosophy and science he was an amateur, seeking to found a new sociology and a Utopian polity out of his own inner consciousness and study of nature, of poetry, and the Bible. It is not wonderful if, in doing this, he poured forth a quantity of crude conceits and some glaring blunders. But in the most Quixotic of his schemes, and the most Laputan of his theories, his pure and chivalrous nature, his marvellous insight into the heart of things and men, and his genius to seize on all that is true, real, and noble in life, made his most startling proposals pregnant with meaning, and even his casual play full of fascination and moral suggestion.

In mastery of prose language he has never been surpassed, when he chose to curb his florid imagination and his discursive eagerness of soul. The beauty and gorgeous imagery of his art works bore away the public from the first, in spite of their heretical dogmatism and their too frequent extravagance of rhetoric. But his later economic and social pieces, such as *Unto this Last, Time and Tide, Sesame and Lilies*, are composed in the purest and most lucid of English styles. And many of his simply technical and explanatory notes have the same quality. Towards the close of his life, in *Fors* and in *Præterita*, will be found passages of tenderness, charm, and subtlety which have never been surpassed in our language.

Ruskin's life and writings have been the subject of many works composed by friends, disciples, and admirers. The principal is the *Life*, by W. G. Collingwood, his friend, neighbour, and secretary (Methuen and Company, 1900), which must be regarded as the biography authorized by Ruskin himself and the family, and is the basis of the foregoing notice. His pupil, Mr E. T. Cook, published his *Studies in Ruskin* in 1890 (G. Allen), with full details of his career as professor. Mr J. A. Hobson, in his *John Ruskin, Social Reformer* (Nisbet and Company, 2nd edition, London, 1899), has elaborately discussed his social and economic teaching, and claims him as "the greatest social teacher of his age." An analysis of his works has been published by Mrs Meynell (Blackwood and Sons, 1900). And his art theories have been discussed in numerous periodicals and essays, and at large by Professor Waldstein, of Cambridge, and in France in the eloquent work of M. Robert de la Sizeranne, *Ruskin et la Religion de la Beauté*, and quite recently by Prof. H. J. Brunhes of Fribourg—*Ruskin et la Bible*, Paris, 1901. (F. H*.)

Russell of Killowen, Charles Russell, Baron (1832-1900), Lord Chief Justice of England, was born at Newry, County Down, on the 10th November 1832. He was the elder son of Mr Arthur Russell, a Roman Catholic gentleman, who was engaged in commerce and brewing in Newry. His mother was the daughter of Mr Mullen, a Belfast merchant, and at the time of her marriage to Mr Arthur Russell was the widow of John Hamill of that city. Within a few years after the birth of Charles Russell the home was changed to Seafield House, Killowen, on the shores of Carlingford Lough, and there his early boyhood was spent. At the age of twelve he was sent to school—first at Belfast, afterwards in Newry, and finally at St Vincent's College, Castleknock, Dublin. In the latter part of 1847 he went into the office of Messrs Hamill and Denvir, solicitors in Newry, and in 1849 he was articled to Mr Denvir, one of the partners in that firm. In March 1852 Mr Denvir died, and Charles Russell's articles were transferred to Mr O'Rorke, a solicitor in Belfast. In 1854 he was admitted, and began to practise his profession. He did well. Disturbances between Roman Catholics and Orangemen were at that time prevalent in this part of Ireland, and in the legal proceedings which ensued at quarter and petty sessions young Russell distinguished himself as a bold and skilful advocate in the cause of his co-religionists. The political zeal which always formed an important element in Russell's character happily harmonized with these professional duties. After practising, however, for two years, he determined to seek a wider field for his abilities, and to become a barrister in England. It was a wise ambition, early conceived by young Russell, stimulated by his present success, and encouraged by the counsel of at least one competent adviser, Judge Jones, who was much impressed by Russell's ability in the conduct of a case at the Newry quarter sessions. He believed, moreover, that to succeed at the Irish Bar he would have (to use his own phrase) to "swallow his convictions." With this end in view Russell, whilst still practising and residing in Belfast, became a student of Trinity College, Dublin. He matriculated there in 1855, and passed examinations from time to time, but did not wait to become a graduate. In 1856 he went to London and became a student of Lincoln's Inn. He worked hard privately. He read in the chambers of Mr Bagshawe, of the Chancery Bar (afterwards a county court judge), and in the chambers of Mr Hilward, a barrister of the Northern Circuit, who in later years became one of the leaders in the Admiralty Court. He also availed himself of the lectures given

by the readers of the Inns of Court, to one of whom, Sir Henry Maine, Russell in later years often referred in terms of special praise. In 1858 he married, in Belfast, Ellen, the eldest daughter of Dr Mulholland, a physician of distinction in that city. On the 26th January 1859 he was called to the Bar, after gaining by examination a first-class honour certificate, and joined the Northern Circuit. Never was that great circuit richer in legal talent. The period of 1859–72, whilst Russell was winning his way to a silk gown, included, on the circuit—to take only the names of some of the older men—Mellish, Edward James, Brett, Quain, Manisty, Davison, Holker, Aspinall, Butt, Herschell, Benjamin, Pope, R. G. Williams, Gainsford Bruce, and Baylis. It was a meet training-ground and arena for the young Irishman, who was destined not only to become leader of his circuit, but to reach a pre-eminence amongst English advocates such as it would be difficult to match in the annals of the Bar. Except some valuable introductions to friends in London and Liverpool, which his uncle, the distinguished president of Maynooth, had given to him, Russell brought to the work of his profession no external aids. He had to rely upon himself. But the equipment was sufficient. A well-built frame; a strong, striking face, with broad forehead, keen grey eyes, and a full and sensitive mouth; a voice which, though not musical, was rich, and responded well to strong emotions, whether of indignation, or scorn, or pity; an amazing power of concentrating thought; an intellectual grasp, promptly seizing the real points of the most entangled case, and rejecting all that was secondary, or petty, or irrelevant; a faculty of lucid and forcible expression, which, without literary ornateness or grace of style, could on fit occasions rise to impassioned eloquence—all these things Russell had. But beyond and above all these was his immense personality, an embodiment of energetic will which riveted attention, dominated his audience, and bore down opposition. His successful advocacy in the Colin Campbell divorce case in 1886, and his famous cross-examination of hostile witnesses and still more famous speech before the Parnell Commission in 1888, afforded perhaps the best examples of Russell's characteristic powers. He was not a learned lawyer in the sense in which Willes, or Mellish, or Blackburn were learned lawyers; he did not possess the fine legal acumen of his great contemporary, Herschell; but he had a sufficient apprehension of legal principles. He handled a point of law with telling directness and force. His argument as the leading counsel for Great Britain in the Bering Sea Arbitration in 1893, and his address at Saratoga on International Law and International Arbitration in August 1896, were expositions of law in its practical application to matters of State which the most learned jurist must admire for their thoroughness and perspicuity.

LORD RUSSELL OF KILLOWEN.
(From a photograph by the London Stereoscopic Company.)

Russell's success, after he joined the Northern Circuit, did not, of course, come to him at once. For some time his work in court was principally in the Court of Passage at Liverpool, which he regularly attended from London. He wrote a book on its procedure, which was published in 1862. This ancient local court, possessing both common law and Admiralty jurisdiction, had as its presiding judge—then styled "assessor"—an eminent leader of the Northern Circuit, Mr Edward James. Substantial commercial cases were tried there, and of these Russell soon had a goodly portion. Steadily, and, for a barrister, speedily, Russell's fortune grew. His biographer, Mr Barry O'Brien, has given, in *The Life of Lord Russell of Killowen* (Smith, Elder, and Company, 1901), an account of Russell's fees, which shows that they were, in round figures: in 1859, £117; in 1862, £1016; in 1866, £2367; and in 1870, £4230. At the commencement of this period Russell wrote occasionally for the newspapers, and especially for the Irish press. From early boyhood onwards he maintained a keen interest in politics, and pre-eminently in the public affairs of Ireland. In 1859 he published a pamphlet entitled *The Catholic in the Workhouse*, and an article from his pen is to be found in *The Dublin Review*, vol. xlviii. p. 497. His legal work was not wholly confined to the north of England. He was employed at the Guildhall and elsewhere by solicitors of position in the City of London. He was one of the counsel engaged in the Windham lunacy case in 1861, and in the action of Saurin *v.* Starr in 1869. In 1865 he argued in *ex parte* Chavasse before Lord Westbury, L.C., and soon afterwards was honoured by him with the offer of a county court judgeship. Two subsequent judges of the High Court of Justice—Mr Justice Bigham and Mr Justice Walton—were among his pupils during this period.

In 1872 Russell took "silk," and from that date for some time he divided the best leading work of the circuit with Holker, Herschell, and Pope. In 1874 Holker became solicitor-general in the Conservative administration. In 1880 Herschell accepted the same office in a Liberal ministry, and about the same time Pope practically left the circuit, to become in a short time one of the most successful advocates at the Parliamentary Bar. Russell's success as a Q.C. during this period of his career was prodigious. He excelled in the conduct alike of commercial cases and of those involving, as he used to say, "a human interest," although undoubtedly it was the latter which more attracted him. He was seen to the least advantage in cases which involved technical or scientific detail. If his advocacy suffered a defeat, however, it was never an inglorious defeat. Those who were on the Northern Circuit at the time will not easily forget the case of Dixon *v.* Plimsoll,—a libel action brought by a Liverpool shipowner against Mr Plimsoll—tried before Baron Amphlett and a Liverpool special jury, in which Holker won a notable victory for the defendant; or Nuttall *v.* Wilde, a breach of promise action, in which Pope led brilliantly for the

successful plaintiff, and Russell's speech for the defence was one of the finest in point of passion and pathos that was ever heard upon the Northern Circuit. At the same time, with all his fighting power, Russell was eminently a sagacious adviser. No barrister knew better how and when to settle a case, where the client's true interest called for a settlement.

In 1880 a new phase of Russell's arduous life began. He was returned to Parliament as an independent Liberal member for Dundalk, a constituency which he had twice before unsuccessfully contested. From that time forward until his appointment to a lordship of appeal in succession to Lord Bowen in 1894, he sat in the House of Commons: for Dundalk until 1885, and afterwards for South Hackney, where he was returned as the Liberal member on four successive occasions—once in 1885, twice in 1886, and again in 1892. The entrance into Parliament laid upon Russell's time and labour a heavy additional tax. His was a nature which could not, in work or even in pleasure, be content to do anything lightly or by halves. He was essentially a man of action; intensity—at times almost fierce intensity—both of purpose and of devotion to its fulfilment characterized everything he did. Upon such a man parliamentary life between 1880 and 1894 necessarily entailed a severe strain. During the whole of this epoch, in home affairs, Irish business almost monopolized the political stage; and Russell was Irish to the core. From 1880 to 1886, as a private member, and as the attorney-general in Mr Gladstone's administrations of 1886 and 1892, he worked in and out of Parliament for the Liberal policy in regard to the treatment of Ireland as few men except Russell could or would work. He never spared himself. After a long day in the turmoil of the courts, he cheerfully gave a long evening to a distant and often, from the standpoint of personal notoriety, an obscure, platform. His position throughout was clear and consistent. Before 1886 on several occasions he supported the action of the Irish Nationalist party. He opposed coercion, voted for compensation for disturbance, advocated the release of political prisoners, and voted for the Maamtrasna inquiry. He wrote to the *Daily Telegraph* a series of letters on the Irish land question, which were afterwards published (Macmillan and Company, 1889) in a collected form. But he never became a member of the Irish Home Rule or of the Parnellite party; he was elected at Dundalk as an independent Liberal, and such he remained. He was proud of the kingdom in whose might and glory Ireland could claim so large a part; and when, as attorney-general in the Gladstone administration, he warmly advocated the establishment of a subordinate Parliament in Ireland, he did so because he sought the amelioration and not the destruction of Ireland's relations with the rest of that kingdom. "I am absolutely opposed," he said (*The Life of Lord Russell of Killowen*, p. 194) to the South Hackney voters, "to separation; but, reserving imperial control on all imperial questions, I think Irishmen on Irish soil should have the power of dealing in the way which seems best to them with all questions that concern them." It is impossible to say that Russell's success in the House of Commons, considerable as it was, was comparable to his success as an advocate in the courts of justice. He was listened to, always with respect and often with admiration, but he was not made for a debater; and the position of a law officer has generally not proved favourable to the attainment of parliamentary eminence. In great public affairs the law officer advises and supports, but not for him is the glory of initiating public policy.

Russell's parliamentary duties, fully as he discharged them, first as a private member and afterwards as attorney-general, were not allowed by him to obstruct his professional career. He rapidly became in London what he was already in Lancashire, the favourite leader in *nisi prius* actions. The list of *causes célèbres* in the period 1880–1894 is really a record of Russell's cases, and, for a great part, of Russell's victories. The best known of the exceptions from the latter category was the libel action Belt *v.* Lawes in 1882, which, after a trial before Baron Huddleston and a special jury lasting more than forty days, resulted in a verdict for the plaintiff, for whom Sir Hardinge Giffard (afterwards Lord Chancellor Halsbury) appeared as leading counsel. The triumph of his client in the Colin Campbell divorce suit in 1886 afforded perhaps the most brilliant instance of Russell's forensic capacity in private litigation. His fees in 1885, the year before he became attorney-general, amounted to nearly £17,000. More important, however, as well as more famous, than any of his successes in the ordinary courts of law during this period were his performances as an advocate in two public transactions of mark in British history. The first of these in point of date was the Parnell Commission of 1888–90, in which Sir Charles Russell appeared as leading counsel for Mr Parnell. The Commission held its first sitting on the 22nd of October 1888, and presented its report in February 1890. In April 1889, after 63 sittings of the Commission, in the course of which 340 witnesses had been examined, Sir Charles Russell, who had already destroyed the chief personal charge against Mr Parnell by a brilliant cross-examination, in which he proved it to have been based upon a forgery, made his great opening speech for the defence. It lasted several days, and concluded on the 12th of April. This speech, besides its merit as a wonderful piece of advocacy, possesses permanent value as an historical survey of the Irish question, during the last century, from the point of view of an Irish Liberal. It was in the same year published after careful revision by its author (Macmillan and Company, 1889). The second public transaction was the Bering Sea Arbitration, held in Paris in 1893. Sir Charles Russell, then attorney-general, with Sir Richard Webster (afterwards Lord Alverstone, L.C.J.), was the leading counsel for Great Britain. Russell, in the course of his very powerful argument before the tribunal, maintained the proposition, which he again handled in his Saratoga address to the American Bar Association in 1896, that "International law is neither more nor less than what civilized nations have agreed shall be binding on one another as international law." The award was, substantially, in favour of Great Britain. In recognition of their distinguished services the Queen bestowed upon both the leading representatives of Great Britain the honour of the Grand Cross of St Michael and St George.

In 1894 Russell's career as an advocate ended. A judgeship, if he had wished it, had been within his reach twelve years before. In 1894, on the death of Lord Bowen, he accepted the position of a lord of appeal. A month later he was appointed lord chief justice of England in succession to Lord Coleridge, to whose memory he devoted in the following September a paper in the *North American Review*. To the discharge of his functions as a judge Russell brought with him all the qualities of intellect and character which had made him so eminent as an advocate, and their greatness was not less conspicuous in his new position. Brief as was his tenure of the office, he proved himself well worthy of it. He was dignified without pompousness, quick without being irritable, and masterful without tyranny. He was scrupulously punctual. Suitors and hearers could not but be impressed by the manifest determination of the lord chief justice to get at the truth, and to do so without waste of time. If this was a fault, it was that of excessive zeal for despatch.

When, occasionally, there were flashes of impatience, they were elicited by the exhibition, as he deemed it, of want of preparation, or slovenliness, or verbosity on the part of the advocate before him. Even the youngest and most obscure practitioner could always count upon the assiduous attention of the lord chief justice to a pertinent and thoughtful argument. In 1896 Lord Russell (Pollock B. and Hawkins J. being on this occasion his colleagues on the bench) presided at the trial at bar of the leaders of the unlawful expedition into the Transvaal which is commonly known as the Jameson Raid. It was a State trial of grave importance. Russell's conduct of it, in the midst of much popular excitement, was by itself sufficient to establish his reputation as a great judge. One other event at least in his career while lord chief justice deserves a record, namely, his share in the Venezuela Arbitration in 1899. Lord Herschell, who had been nominated to act with Lord Justice Collins (afterwards master of the rolls) as a British representative on the Commission of Arbitration, of which the distinguished Russian jurist M. Marteus was president, died somewhat suddenly in America before the commencement of the proceedings. The lord chief justice accepted the invitation to take the vacant place, and performed his very onerous duty with conspicuous ability.

Nor was it only on the bench or as an international judge that Lord Russell of Killowen sought, during the last years of his busy life, to do service to his country. He signalized his zeal as a law reformer by the public advocacy of radical changes in the system of legal education in the Inns of Court, and by the promotion of measures to put down the vice of secret and illicit commissions in commercial and business life. On the former subject he delivered in 1895 an address in Lincoln's Inn Hall, under the auspices of the Council of Legal Education, which was afterwards printed and published (Wyman and Sons, Limited). In 1899, dealing with the latter question, he introduced in the House of Lords a Bill, which had its first reading. He again introduced a Bill in the session of 1890, which was read a second time, but did not become law. On the 10th August 1890 the great advocate and great judge passed quietly away at his London residence, after a short illness due to an internal malady.

In private, as in public life, Russell was always strenuous, and most attracted by things that called for the exercise of activity, whether bodily or intellectual. Inaction he disliked both for himself and in others. Though not an athlete, he took an interest in manly pastimes: he was fond of riding and of breeding horses; he liked being on the racecourse; and he enjoyed games, both of skill and of chance. A student of books he was not; he could lay no claim to wide learning or elegant scholarship; but he could appreciate a good book; he was versed in Shakespeare; and he knew and loved the poetry and the songs of his native land. When he wrote, his style, inornate, clear, and forcible, reflected the character of his thought. He was a staunch and sympathetic friend, ever ready in an unostentatious way to help, where help was really needed. While he undoubtedly exhibited at times, chiefly during the earlier part of his career, a certain brusqueness and impetuousness of speech and demeanour, those who came into contact with him recognized that such occasional outbursts never sprang from any desire to hurt, or from any unkindness of disposition. In his contests at the Bar he never made an enemy. He was a strong man, and he liked to have his way; but he was also large-hearted and without a tinge of rancour in his disposition. He was never offended by opposition. Whilst he did not himself shine as a wit or a humorist in conversation or in after-dinner oratory, he heartily enjoyed fun and humour in others; and, wherever he was, the force and distinctness of his personality never failed to impress his company. Probably no English lawyer ever excited abroad the admiration which was accorded to Lord Russell of Killowen, alike on the Continent and in America. To the United States he paid two visits, the first in 1883 and the second in 1896. On both occasions he won golden opinions, which were manifested in widespread and warm expressions of sympathy and regret when the news of the death of Lord Russell of Killowen passed across the Atlantic. Between 1894 and 1897 Lord Russell of Killowen received the degree of Doctor of Laws *honoris causâ* from the universities of Dublin, Edinburgh, and Cambridge, and from the Laval University, Quebec. In 1892 he was treasurer of Lincoln's Inn. He left surviving him, besides his widow, five sons and four daughters. His sister Katherine (in religion, Sister Mary Baptist Joseph), pioneer sister of mercy in California, had died two years before at San Francisco. (W. R. K.)

Russell, Thomas (1762–1788), English poet, was the son of John Russell, who, according to the preface to his son's poems, was an attorney at Bridport, in Dorsetshire; the poet was born, however, at Beaminster, early in 1762. His mother had been Miss Virtue Brickle, of Shaftesbury. He was educated at the grammar school of Bridport, and in 1777 proceeded to Winchester, where he stayed three years, under Dr Joseph Warton, and Thomas Warton the poetry professor. In 1780 Russell, already distinguished as a classical scholar, was elected a fellow of New College, Oxford. He was ordained in 1785. During his residence at the university he devoted himself not merely to the ancients, but, what was then extremely unusual, to French, Italian, Spanish, Portuguese, Provençal, and even German literature. His health, however, broke down, and he retired to Bristol hot wells to drink the waters; but in vain, for he died there on the 31st of July 1788. He was buried in Powerstock churchyard, Dorset. In 1789 was published a thin volume, containing his *Sonnets and Miscellaneous Poems*, now a very rare book. It contained twenty-three sonnets, of regular form, and a few paraphrases and original lyrics. The sonnets are the best, and it is by right of these that Russell takes his place as one of the most interesting precursors of the romantic school. "War, Love, the Wizard, and the Fay he sung"—in other words, he rejected entirely the narrow circle of subjects laid down for 18th-century poets. In this he was certainly influenced both by Chatterton and by Collins. But he was still more clearly the disciple of Petrarch, of Boccaccio, and of Camoens, each of whom he had carefully and enthusiastically studied. His sonnet "Suppos'd to be written at Lemnos" is his masterpiece, and was greatly admired both by Wordsworth and Landor, who said that it "authorized Russell to join the shade of Sophocles"; it has been remarked that this is unquestionably the greatest English sonnet of the 18th century. The anonymous editor of Russell's solitary volume is said to have been William Howley (1766–1848), long afterwards archbishop of Canterbury, who was a youthful bachelor of New College when Russell, who had been his tutor, died. His memoir of the poet is very prefunctory, and the fullest account of Russell is that published in 1897 by Mr T. Seccombe. As the elder by nine months of Bowles, whose schoolfellow he was at Winchester for four years, and whom he seems to have slightly preceded as a composer of sonnets, Russell takes his place as the precursor of the school of romantic poets inspired by the study of nature and of the modern literature of the Continent. (E. G.)

Russell, Sir William Howard (1821– ——), English war correspondent, was born at Lilyvale, near Tallaght, in the county of Dublin, 28th March 1821, being one of the Russells of Limerick, whose settlement in Ireland dates from the time of Richard II. After a preliminary education under Mr Geoghegan in Dublin, he entered Trinity College in 1838. Three years later he was thrown very much on his own resources, but a relative, Mr R. W. Russell, who had been sent to Ireland by *The Times*, deputed him to report the Irish elections at Longford, and his success definitely turned his attention to journalism. Coming to London in 1842, he went to Cambridge, but left before taking a degree. In the following year he was sent by *The Times* to Ireland to report the O'Connell meetings. In 1845 he was appointed to superintend the reports on the Irish railways, and was shortly afterwards sent by *The Times* to inspect the O'Connell property in the south-west of Ireland, when his plain speaking drew forth a characteristic tirade from the "Liberator." For a short period in 1847 his services were temporarily transferred to the *Morning Chronicle*, but with that exception he remained permanently connected with *The Times*. He was sent as special correspondent to Denmark in the war of 1849–50. He did not, however, at once relinquish a legal career, and was called to the Bar at the Middle Temple in 1851. On the outbreak of the Crimean war in 1853 he went out as special correspondent with the vanguard of the British expedition, and, accompanying the light division to Gallipoli, proceeded with the first detachment to Varna. It was a new departure in journalism, and Russell was the first of the great war correspondents. On the embarkation for the Crimea he was attached to the second division, and landed with it on the 14th of September. He was present at the battle of the Alma on 20th September, at the investment of Sebastopol, at Balaclava 25th October, and Inkerman 5th November.

Towards the end of May 1855 he accompanied the expedition to Kertch, and did not return to the Crimea until the following August. In September and October he described the attacks on the Malakoff and Redan, the occupation of Sebastopol, and the capture of Fort Kinburn; and when the British forces finally evacuated the Crimea in July of the following year, he was among the last who left. The popularity of *The Times'* Crimea correspondence led to its republication in two volumes under the title of *The War, 1855–56*. Russell's letters to *The Times* were mainly responsible for the enlightenment of the public at home as to the conduct of affairs at the scene of action, and his exposure of the mismanagement during the winter of 1854—the accuracy of which was afterwards fully corroborated—did more than anything else to cause the downfall of Lord Aberdeen's ministry. Apart altogether from his material, his descriptions were brilliant and powerful, and he returned home to find himself famous as "Balaclava Russell." In 1856 Russell was sent to Moscow to describe the coronation of the Tsar, and in the following year was attached to the headquarters of Lord Clyde in India. He was present at the siege and capture of Lucknow in 1858, the operations in Oude, the battle of Bareilly, and the actions in Rohilkhand, which preceded the suppression of the revolt, and he received the Indian war medal with the Lucknow clasp. The events of those stirring times are vividly recorded in *My Diary in India in 1858–59*. Next year he was sent to Italy, but too late to see any active service, for he arrived on the eve of the armistice at Villafranca. On 7th January 1860 appeared the first number of the *Army and Navy Gazette*, which he founded, and of which he is still editor and principal proprietor. When it became evident in 1861 that civil war was imminent in the United States, Russell proceeded to Washington, and reached M'Dowell's headquarters just before the first battle of Bull Run, and his account of the Federal retreat drew much hostile criticism. He published a full account of the war, in so far as he had witnessed it, in *My Diary, North and South, during the Civil War in America, 1862*. Returning to England in 1863, he described the ceremonies and festivities on the occasion of the marriage of the Prince of Wales, and remained at home until the outbreak of the Austro-Prussian war of 1866, when he proceeded to the headquarters of General Benedek and witnessed the battle of Königgrätz, 3rd July. During the interval of peace that followed he accompanied the Prince of Wales to the Nile, Constantinople, the Crimea, and Greece in 1868, and published an account of the tour in the following year, when he also contested the borough of Chelsea unsuccessfully in the Conservative interest. On the outbreak of the Franco-Prussian war in 1870, Russell repaired to the headquarters of the crown prince at Wörth, and was with him from the battle of Wörth, 6th August, and Sedan, 12th September, till the capitulation of Paris. His account of the scenes he witnessed appeared in 1874 under the title of *My Diary during the Last Great War*. His description of the burning of Paris by the Communards was not the least of his journalistic triumphs. In 1875–76 he was honorary private secretary to the Prince of Wales during his tour through India, of which he published an account in 1877. When Lord Wolseley was sent to quell the Zulu rebellion in 1879, Russell was attached to his staff as correspondent. In 1881 he went with the Duke of Sutherland's party for a tour in the United States and Canada, described in *Hesperothen*, and in 1882 he was again with Lord Wolseley in the Egyptian campaign. In 1889 he undertook to report upon the nitrate fields of Tarapaca, and published the account of his journey in the following year, under the title, *A Visit to Chile*. In 1895 he published a personal retrospect entitled *The Great War with Russia*. Sir Howard was knighted in May 1895, and was the recipient of numerous war medals and various foreign orders. He married twice, first in 1846 Miss Burrowes, who died not long afterwards, and secondly in 1884 the Countess A. Malvezzi.

RUSSIA.

The Russian empire, which represents an extensive territory in eastern Europe and northern Asia, has an area exceeding 8,660,000 square miles, thus covering one-sixth part of the land surface of the globe. The population, however, estimated in 1901 at about 135,000,000, represents only one-fourteenth of the inhabitants of the world. In 1898 the limits of the empire were extended by the "lease" from China of the Liaotung peninsula, in the Gulf of Pechili, *i.e.*, Port Arthur and Ta-lien-wan, with the adjacent seas and territory to the north. Out of this territory a separate province, Kwang-tung, was created in 1899, its area being estimated at 1224 square miles, out of which 141 square miles are occupied by a number of small islands, and the population at 250,000, including 7000 afloat and 15,000 on the islands (see map and description in *Izvestia* of the Russian Geographical Society, 1900). After the Boxer rising in China of 1901, Manchuria was also practically occupied by Russian troops, being

treated for all practical purposes as a sort of vassal territory to Russia, standing towards the empire in a position not unlike that occupied by Bokhara and Khiva. Of these two khanates, the latter (area, 22,320 square miles, population about 800,000) is practically subject to Russia; while the former (area about 92,000 square miles, population about 2,500,000) is every day becoming more and more a Russian dependency now that the railway connecting the Russian Transcaspian territory with Turkestan (Samarkand and Tashkent) has been completed. Russian influence is at the same time rapidly extending over Mongolia (*q.v.*). In Afghan Turkestan the most southern point reached by the Russian empire is, according to the International Commission, 35° 38′ 17″ N., 62° 21′ 52″ E. The total length of the frontier line of the Russian empire by land is 2800 miles in Europe and 9550 miles in Asia; by sea, 11,090 miles in Europe and about 19,590 miles in Asia.

Population.

The population of the empire, which was estimated at 74,000,000 in 1856–59, was found to be nearly 129,000,000 at the census of 1897, taken over all the empire except Finland. Thus since 1860 the population has increased 74 per cent. The increase has chiefly taken place in the large cities of Siberia, Poland, Lithuania, and Caucasia. The area and population of the various official divisions of the empire are given in the following table:—

Province.	Area: English Square Miles.	Domiciled Population, 1897.	Density per Square Mile.

* The areas occupied by the larger lakes and rivers (see ninth edition) are included in the above table, but they have been excluded in calculating the densities of the population.

It has been found, from a comparison of the densities of population of the various provinces in 1859 with the distribution in 1897, that the centre of density has distinctly moved southwards, towards the shores of the Black Sea, and westwards, the greatest increase having taken place in the eastern Polish and Lithuanian provinces, along the south-western border, in the prairie belt beside the Black Sea, and in Orenburg. Northern Caucasia and south-western Siberia likewise show a considerable increase. The census revealed a remarkably low proportion of men to women in several provinces. This was owing to the fact that large numbers of the men engaged in agricultural pursuits during the summer temporarily move every year into the large industrial centres for the winter. Consequently there were only 87·4 and 89·8 women to each 100 men in the provinces of St Petersburg and Taurida, but as many as 133 in Yaroslav, 119 in Tver, and 117 in Kostroma. The average number of women to each 100 men in the Russian provinces proper was 102·8; in Poland, 98·6; in Finland, 102·2; in Caucasia, 89·5; in Siberia, 95·7; and in Turkestan and the Transcaspian territory, 83·0.

The natural increase of the population per annum is very nearly 2,000,000, as will be seen from the following statistics of births and deaths, which are the latest available:—

1896.	Births.	Per 1000.	Deaths.	Per 1000.	Surplus.
European Russia and Poland	4,892,949	47·2	3,279,572	31·8	1,613,377
Finland	83,884	33·3	49,289	19·5	34,595
Siberia	266,442	46·5	186,299	32·5	80,143
Caucasus	355,508	37·0	204,023	21·2	151,485

,, 1898, without Finland	5,769,218	...	3,845,968	...	1,923,350

The figures for European Russia alone (without Poland) are: 857,371 marriages, 4,692,621 births, 2,976,453 deaths; natural increase, 1,716,168.

The effects of emigration and immigration cannot be estimated with accuracy, because only those who cross the frontier with passports are taken account of. The statistics of these show that there was during the thirty-two years 1856–88 an excess of emigration over immigration of 1,146,052 in the case of Russians, and a surplus of immigration of 2,304,717 foreigners. On the other hand, in the six years 1892–97 the excess of Russian emigration over immigration was 207,353, as compared with an excess of foreign immigration over emigration of only 136,740. It is also known that the number of Russian immigrants into the United States in 1891–97 was: 292,032 from European Russia, 91,994 from Poland, and 24,977 from Finland, as compared with only 313,469 from the Russian Empire generally in 1873–90. The total emigration of Russians to America through the three chief German ports was 519,000 during the eleven years 1887–97. 29,226 went to Brazil in 1890, and about 6000 to Canada in 1898. No less than 41,108 in 1900 and 36,961 in 1901 emigrated through Hamburg alone to America. The emigration to Siberia varies much from year to year. It was about 80,000 in 1898, and from 150,000 to 200,000 during the two previous years, as also in 1901. Altogether no less than 1,150,095 persons migrated to Siberia during the years 1882–97. There is also some emigration from central Russia to the southern Urals, as also to some of the Steppe provinces.[1]

Cities.—Taken as a whole, only 13 per cent. of the population of Russia lived in towns in 1897, but in the years 1857–60 less than 10 per cent. of the population was urban. In Russia proper less than 2 per cent emigrated from the villages to the towns during the forty years ending 1897. The following table shows the urban population in the various divisions of the empire in 1897:—

	Urban Population.	Percentage of Total.
European Russia	12,027,038	12·8
Poland	2,055,892	21·7
Finland	281,216	11·0
Caucasia	1,010,615	10·9
Siberia	473,796	9·3
Central Asia	936,655	12·0
Russian Empire	16,785,212	13·0

There were only twelve cities with more than 100,000 inhabitants in 1884; in 1897 there were nineteen, namely, St Petersburg (1,267,023; 1,439,739 on 27th December 1900), Moscow (988,614; 1,035,664 in December 1900), Warsaw (638,208), Odessa (405,041), Łódź (315,209), Riga (256,197; 282,943 in 1900), Kiev (247,432), Kharkov (174,846), Tiflis (160,645), Vilna

[1] See statistics collected by State Secretary Kulomzin, 1898; *Siberia*, by the Ministry of the Interior, 1899.

(159,568), Tashkent (156,414), Saratov (137,109), Kazañ (131,508), Ekaterinoslav (121,216), Rostov-on-the-Don (119,889), Astrakhan (113,001), Baku (112,253), Tula (111,048), and Kishinev (108,796). It is interesting to note that while only three of these are in Middle Russia (Moscow, Tula, and Kazañ), eight are in South Russia, and two in Caucasia. There are thirty-seven cities with from 50,000 to 100,000 inhabitants. The mortality in most towns is so great that during the last ten years of the 19th century, in a very great number of cities, the number of deaths exceeded that of births by from 1 to 4 in the thousand.

Religion.—The approximate distribution of the population according to religion is as follows:—Greek Orthodox (including all dissenters), nearly 96,000,000; United Church and Armenians, 1,350,000; Roman Catholics, 12,200,000; Protestants, 6,750,000; Jews, 4,050,000; Mahommedans, 12,150,000; others, 2,700,000. The empire is divided into 64 bishoprics, which were in 1897 under 3 metropolitans and 62 archbishops and bishops. The number of monasteries and nunneries has considerably increased of late; in 1897 there were 497 monasteries and 268 nunneries, with 8076 monks and 6978 male aspirants, and 8942 nuns and 27,166 female aspirants. The Holy Synod received in 1900 over 23,500,000 roubles from the Imperial budget, in addition to its own considerable revenue and the private revenues of the churches and the monasteries.

Education.—Little progress has been achieved as regards education. Distrust of natural sciences, even in their technical applications, and of "Western" ideas of free democratic government—desire to make university education, and even secondary education, a privilege of the wealthier classes—neglect of primary education, coupled with suppression by the Ministry of Public Instruction of all initiative, private and public, in the matter of spreading education among the illiterate classes—these were the distinctive features of the educational policy of the last twenty years of the 19th century. Only quite recently has a change taken place in the attitude of the Government towards technical education, and a few high and middle technical schools have been opened.[1] Only recently, too, has a reform been started in secondary education with the object of revising the so-called "classical" system which has been favoured in the lyceums since the 'seventies, the complete failure of which has now been demonstrated after nearly thirty years of experiment. As to primary education, there is nothing at present to brighten its gloomy outlook; only the opening of Sunday schools, which was prohibited since 1861, was allowed in 1870, and rendered easier still some years later.

The total number of primary schools in the Russian empire (exclusive of Finland) in 1898, and their different categories, are best seen from the following table[2]:—

Under the	Number of Schools.	Number of Pupils.		
		Boys.	Girls.	Total.
Ministry of Public Instruction . . .	37,046	1,965,549	684,509	2,650,058
Holy Synod . .	40,028	1,118,404	350,085	1,476,124
Institutions of Empress Marie . . .	153	2,537	2,560	5,097
Ministry of Interior .	553	16,432	4,078	20,510
,, Navy .	4	226	153	379
,, War . .	848	30,498	13,905	46,420
Various . . .	67	2,517	2,141	4,658
Total . . .	78,699	3,136,163	1,057,431	4,203,246*

* This last sum is slightly in excess of the sum of the two preceding, as the sex of 9652 pupils is not known.

Nearly 30,000 Jewish *heders* and Mussulman *medreses* and *mektebes* must be added to the above. Besides, all soldiers are taught, at least reading, in nearly 7500 schools in the regiments. Thus, apart from the schools under the Ministry of War (Cossack *voiskos* and schools at the barracks), the great bulk of the primary schools are either under the Ministry of Public Instruction or the Holy Synod. Those under the latter body are of recent growth, the policy of the last twenty years of the 19th century having been to spend the budget allowances upon primary instruction by handing them over to the Holy Synod, which opened parish schools under the local priests. The schools under the Synod are themselves divided into two categories: parish schools, with 614,609 pupils; and reading schools, of an inferior grade, with 501,883 pupils (in European Russia). No teaching certificate is required by the teachers in either class of school, the permission of the bishop (like the French *lettre d'obédience* of 1849) being sufficient. The consequence is that, the village priests being too much occupied with their parish duties, they cannot give more than nominal attention to the schools, and the numerous pupils either exist on paper only, or are handed over to half-educated cantors, deacons, or hired teachers, very often of a low description. In fact, in 1898 the teachers in the schools of the Holy Synod were: priests, only 1203; deacons, 3399; cantors, 4232; hired teachers, 22,987. Of properly organized primary schools—besides the special ones—there are, consequently, only those under the ministries of Public Instruction and War, and the Interior, in Siberia. The distribution of the first and the third categories of these schools in 1896 is shown by the following table, the figures being below the preceding, chiefly on account of a less complete registration:—

Schools under the Ministries of Instruction and Interior.	Schools supported by			Total Number of Schools.	Number of Pupils.		
	The State.	The Local Institutions.	Factories and Private Gifts.		Boys.	Girls.	Total.
European Russia	2407	23,115	415	26,591	1,575,044	466,153	2,131,197

* Maintained by the Ministry of the Interior, by means of moneys supplied by the local administration.

Thus the number of primary schools actually maintained by the Ministry of Public Instruction is only 2407 in European Russia, and less than 2700 throughout the whole empire, that is, less than 10 per cent. of the aggregate number of primary schools, the great bulk of the schools (as well as the normal schools for teachers) being supported by the *zemstvos* and the municipalities. Notwithstanding this, the main efforts of the ministry, and the purport of recent legislation, have been to exclude the local institutions from any share in matters affecting primary education, other than the supply of schoolhouses and current expenses. Taking the figures of the preceding table, it appears that only 4·8 per cent. of the total male and 1·6 per cent. of the total female population received primary education in 1899. The schools were distributed very unequally; in five provinces (Olonets, Esthonia, Tula, Livonia, Arkhangelsk, and Novgorod) there was only one primary school for every 638 to 983 inhabitants, while in other provinces (including Kovno, in European Russia) the proportion was even less than one school for each three thousand. One good feature of the Russian primary schools, however, is that in as many as 7247 village schools there are school gardens or fields; in 951 schools, bee-keeping, and in 322 schools, silkworm culture is taught; while in 865 schools the children receive instruction in various trades; and in 305 schools in *slöjd*. Girls are taught handwork in 4556 schools. The average number of teachers was 1 for every 27 pupils, and 44 per cent. of the teachers were women. There were in the same year 9 teachers' institutes and 76 normal schools for teachers, with 6227 pupils. The total expenditure on primary schools in 1899 was 29,612,392 roubles (about the average in recent years), of which 13 per cent. was supplied by the State, 28 per cent. by the *zemstvos*, 37 per cent. by the village communities and the municipalities, and 18 per cent. by private persons.

The middle schools of Russia (exclusive of Finland) were composed in 1899 as per table on next page.

For higher education there were only 9 universities, with 16,570 students in 1899, 2 medical academies, 6 theological academies (944 students), 4 military academies (1360), 2 philological institutes, 3 Eastern languages institutes, 4 judicial military academies, 4 veterinary institutes, 3 agricultural colleges, 2 mining institutes, 4 engineering institutes (2407 students in all the higher technical schools), 2 universities for women (930 students at St Petersburg), and 1 medical academy for women. Finland has a university of its own at Helsingfors.

Government.—No substantial changes have lately taken place in the fundamental laws of the empire. The fact has been brought to light that a complete scheme of constitutional government was drawn up in 1809 by Alexander I., with Speransky as collaborator, though only the first step towards carrying it out—that is, the remodelling of the Council of State in 1810—was ever taken, the Napoleonic wars preventing anything further being done in the matter. The idea, however, was not abandoned, and a new scheme was drawn up in 1818 by Novosiltseff, a personal friend of Alexander I., and the French lawyer Deschamps. The intention of the emperor was partly realized by granting a constitution to Poland in 1815, and his intention of extending to Russia the beneficial effects of free and lawful institutions was publicly announced by him in 1818 at the opening of the Diet at Warsaw. The idea of granting to Russia a consultative Assembly of a representative character (*une assemblée des notables*) reached maturity under Alexander II. in the first month of 1881, and on 17th February (1st March) 1881 the emperor confirmed a report of Count Loris Melikoff to that effect.[1]

An imperial decree summoning that Assembly was laid before Alexander II. on 1st (13th) March 1881, and its wording approved by him a few hours before his death, on condition that the decree should be laid before the Committee of Ministers on 4th (16th) March for its definitive sanction. The death of the monarch prevented this important step from being carried out. The decree was laid before the Committee of the Ministers and approved by the majority of them on 8th (20th) March, but on 29th April (11th May) Alexander III. issued a manifesto in which he wrote: "The voice of God orders Us to take in hand the work of government vigorously, in our hope in God's providence, and with faith in the power and truth of Autocratic power, which We are called upon to enforce and to protect from all attempts against it."

The powers of the Committee of Ministers, created by Alexander II. in November 1861, still remain undefined, although it must be noted that this committee has occasionally assumed the powers of a "ministry." Considerable alterations in local government were effected under Alexander III. by the laws of 12th (24th) June 1890 concerning the *zemstvos*, or councils for provincial self-government; 11th (23rd) June 1892, concerning municipal self-government; and 12th (24th) July 1889, concerning the peasants' self-government. In the *zemstvos* the influence of the nobility was increased, and the peasants were deprived of the right of electing their representatives, who are now nominated by the governor of the province from candidates elected by the peasants. At the same time the decisions of the *zemstvos* were made subject to the approval of the governors not only in the case of unlawful decisions, but in every particular. Similar limitations were applied to municipal self-government. As to the peasants, their self-government was placed under the direct control of "landchiefs" nominated by the governors, who received, moreover, the right of nominating the cantonal judges of the peasant cantonal courts (*volostnoï sudiya*), and of inflicting punishments (including corporal punishment) upon the peasants, without bringing the culprits before any court. At the same time, the justices of peace, who had been elected since 1861, were abolished in the country, and were maintained only in the two capitals and six principal cities—the judicial power being transferred to the police officers. The *zemstvos*, which were first instituted in thirty-four out of the fifty governments of European Russia, have recently been granted to three more governments; but further reductions of their powers as regards education, statistical researches about the peasants, and even the administration of famine-relief funds took place. A "lesser state of siege" continues to be maintained in the governments of St Petersburg, Moscow, Kiev, and several western provinces; in 1902 it was extended to all principal industrial towns.

Justice and Crime.—The judicial institutions introduced by the Judicial Law of 1864 also underwent certain limitations during the reign of Alexander III. The law of 20th May (1st June) 1885 considerably limited the principle of the independence of the magistrates; that of 7th (19th) July 1889 reduced the competence of the juries, special courts with "class representatives" nominated *ad hoc* being introduced instead in a number of cases; the introduction of the "landchiefs" reintroduced the principle of combining the judicial and the administrative power in the hands of the same persons. Finally, the right of sentencing persons to the so-called "administrative exile" to Siberia (including the Arctic region of Kolymsk) and other remote portions of the empire, without trial and by simple orders of the administration, which was formerly an arbitrary act of the State police, was rendered legal and brought within the province of the Minister of the Interior, the term of sentence ranging from two to five years, and being capable of being prolonged, once or more than once, for another five years by a special order of the minister. In 1889 the judicial procedure of 1864 (with the above limitations) was introduced in the Baltic provinces; in 1894–98, in the governments of Olonets, Orenburg, Ufa, and Astrakhan; in 1896, with further limitations, in Arkhangelsk; and in 1897–99 in Siberia, Turkestan, the Steppe provinces, the government of Vologda, and the Transcaspian province. The justices of peace introduced in these provinces are nominated by the Government. The criminal statistics for 1874–94, for 33 governments into which the reformed tribunals had been introduced since 1874, show that there was no increase of criminality during these years, and that for a population of 64,030,000 there were on the average 63,787 condemnations per annum, of which nearly two-thirds (39,500) were for minor crimes dealt with by the justices of peace. There is, however, a notable increase (100 to 230) in crimes against persons, and a notable decrease (100 to 72) in those against property. The proportion of criminality varies from 156 to 90 to each 100,000 of the population in the judicial districts of Poland and Revel, and from 77 to 23 to each 100,000 inhabitants in all other judicial districts.

Prisons.—In the year 1899 there were 886 lock-ups and 7 hard-labour prisons, the population of which was 640,439 men and 88,869 women. There were 12,059 inmates in the hard-labour prisons, and 1285 children in 37 reformatories. It is worthy of note that during the year there was not one single case in which flogging was applied in the hard-labour prisons of Sakhalin; but the condition of the children of the exiles on the island is very miserable, owing to a want of schools: only 834 children, out of 4954, go to school. A step of considerable importance was taken on 12th June 1900, when it was decided that exile to Siberia was to be brought to an end.

Finance.—The ordinary revenue is in excess of the ordinary expenditure, but the extraordinary expenditure not only swallows up this surplus, which exceeded 200,000,000 roubles in 1898 and 1899, but necessitates the conclusion of fresh loans every year. It must be admitted, however, that there is much to show for this extraordinary expenditure. A considerable number of new railways, including the Trans-Siberian, have been built; the old loans, at from $4\frac{1}{2}$ to 6 per cent. (3,037,675,234 roubles), have been converted into 4 per cent. loans at a cost of 72,724,063 roubles; and the value of the paper money has been settled at a permanent rate of exchange—1 rouble 50 copeks in paper for 1 rouble in gold. The paper money in circulation has also been reduced: while it was 1,121,300,000 roubles in 1896, it only amounted to 630,000,000 roubles in 1901. The guarantee fund, too, in gold, destined to cover the paper money, has increased from 750,000,000 roubles in 1896 to 807,800,000 roubles in 1901, and thus exceeds the paper money in circulation by 28 per cent. The State debt, which was increased in the 10 years 1890–99 by 893,971,568 roubles (17 per cent.), amounted to 6,225,095,992 paper roubles on 1st January 1900 (£656,547,764 in 1901; net interest paid, £25,418,303). The budget estimates have grown in proportion. The ordinary revenue, which was 952,045,496 roubles in 1890, amounted to 1,800,784,482 roubles in 1902, an increase of 89 per cent., chiefly due to (1) an increase in the revenue from new railways bought by the State (325,624,000 roubles); this is absorbed by the costs of exploitation and the payment on obligations; (2) the introduction of a State monopoly for the sale of spirits (445,807,000 roubles); (3) an

[1] Its text is given in the *Russian Encyclopædic Dictionary*, article "Russia," vol. xxvii. A, St Petersburg, 1899.

increase in the import duties (78,883,000 roubles); and (4) an increased revenue from sugar, spirits, various duties, State monopolies, State domains, and direct and indirect taxes, partly due to increased taxation, and partly to natural growth corresponding to the industrial development of the country. The expenditure, which was 1,038,690,982 roubles in 1890, was estimated at 1,946,571,976 roubles for 1902. The army and the navy were estimated to cost 420,957,521 roubles in 1902, the national debt and the railway obligations 368,460,000 roubles, the working expenses of railways and canals 435,547,758 roubles, new railways and ports 165,660,000 roubles, while public instruction had a grant of only 36,624,000 roubles. It must be observed that in the State budget considerable sums with which the Ministries of Finance, Ways and Communications, are credited and debited (335,198,000 roubles and 435,547,000 roubles respectively) are mere transfers, the Ministry of Finance retaining in its hands the sale of spirits in many provinces of the empire, while the Ministry of Ways and Communications administers the State railways, of which the gross receipts appear in the budget as revenue and the working expenses as expenditure. Turning to the question of local finance, it is found that the 34 provinces which enjoy the right of being administered by the local *zemstvos* yield a yearly revenue of from 60,000,000 to 66,000,000 roubles, while the other provinces have an aggregate revenue of about 18,000,000 roubles. The towns of European Russia proper, Poland, and Siberia have an aggregate revenue of about 75,000,000 roubles, and the village communities of European Russia proper are taxed to the amount of 62,000,000 roubles.

Army.—The system of obligatory military service for all, introduced in 1874, has been maintained, but the six years' term of service has been reduced to five, while the privileges granted to young men who have received various degrees of education have also been reduced to a small extent. During the reign of Alexander III. efforts were mainly directed towards (1) reducing the time required for the mobilization of the army; (2) increasing the immediate readiness of cavalry for war and its fitness for serving as mounted infantry (dragoon regiments taking the place of hussars and lancers); (3) strengthening the western frontier by fortresses and railways; and (4) increasing the artillery, siege, and train reserves. Further, the age releasing from service was raised from 40 to 43 years, and the *opolcheniye* (militia, *landsturm*) was reorganized. The measures taken during the reign of Nicholas II. have been chiefly directed towards increasing the fighting capacity and readiness for immediate service of the troops in Asia, and towards the better reorganization of the local irregular militia forces. Obligatory military service has also been in part extended to Finland. Broadly speaking, the army is divided into regulars, Cossacks, and militia. The peace strength of the army is estimated at 42,000 officers and 1,100,000 men (about 950,000 combatants), while the war strength is approximately 75,000 officers and 4,500,000 men. However, this latter figure is merely nominal, the available artillery and train service being much below the strength which would be required for such an army: estimates which put the military forces of Russia in time of war at 2,750,000 —irrespective of the armies which may be levied during the war itself—seem to approach more nearly the strength of the forces which could be mustered. The infantry and rifles are armed with small-bore magazine rifles, and the active artillery have steel breech-loaders with extreme ranges of from 4150 to 4700 yards.

Navy.—Owing to its geographical situation and its widely separated seas, Russia has to maintain four distinct squadrons: the Baltic, the Black Sea, the Pacific, and the Caspian. Consequently, notwithstanding a very considerable and continuous increase in the expenditure on the navy, the fleet is strong in none of these seas: the Baltic fleet is constantly being drawn upon for reinforcements for the Pacific flotilla, while the Black Sea fleet has no access to the Mediterranean. The strength of the Russian fleet in March 1902, according to the international classification of the *Statesman's Year-Book*, was:—

Class of Ship.	Baltic and other Stations.		Black Sea.		Total.
	Completed.	Building.	Completed.	Building.	
Battleships, 1st class	1	6	1	1	9
,, 2nd ,,	7	2	6	...	15
,, 3rd ,,	2	...	...	...	2
Coast defence vessels	7	1	...	...	8
Cruisers, armoured	1	1	...	...	2
,, belted or protected	15	7	...	2	24
Gunboats	30	2	8	...	41
Old armour-clads and armour gunboats	8	...	...	...	8

There were, moreover, 21 destroyers afloat and 13 building, and 45 first-class torpedo-boats afloat and 6 building, besides 41 second-class and 101 third-class boats. The torpedo-boats can be transported overland from the Baltic to the Black Sea. The total number of officers and men is about 45,000.

Fortresses.—The chief first-class fortresses of Russia are Warsaw and Novogeorgievsk in Poland, and Brest-Litovsk and Kovno in Lithuania. The second-class fortresses are Kronstadt and Sveâborg in the Gulf of Finland, Ivangorod in Poland, Libau on the Baltic Sea, Kertch on the Black Sea, and Vladivostok on the Pacific. In the third class are Viborg in Finland, Ossovets and Ust Dvinsk (or Dünamünde) in Lithuania, Sebastopol and Ochakoff on the Black Sea, and Kars and Batum in Caucasia. There are, moreover, 46 forts and fortresses unclassed, of which 6 are in Poland, 8 in West and South-West Russia, and the remainder (mere fortified posts) in the Asiatic dominions.

Agriculture.—The chief occupation of approximately seven-eighths of the population of European Russia is agriculture, but its character varies considerably according to the soil, the climate, and the geographical position of each region. From detailed researches that have lately been made by Professor Dokuchaeff and his pupils into the soils of Russia, it would seem that a sinuous line drawn across European Russia from Zhitomir to Kiev, Tula, Ryazañ, Simbirsk, and Ufa, that is, from west-south-west to east-north-east, represents a characteristic boundary separating the "northern soils" from the "southern soils." To the south of this line, as far as the sandy deserts of Astrakhan and the prairies of North Caucasia, lies the "black earth" region, covering nearly 270,000,000 acres. Forests give place to prairies, and the soil, which contains from 4 to 16 per cent. of humus, is very fertile; but the whole region suffers periodically from drought. The "northern soils," which are glacial deposits more or less redistributed by water, are much less fertile as a rule, and offer all possible varieties from a tough boulder clay to loose sand. They require heavy manuring; phosphates, which are extracted in four distinct regions of European Russia (Podolia, Central Russia, Ryazañ, and the Upper Volga), being especially beneficial. The agricultural zones are disposed parallel to the above-mentioned boundary line. The prairie zone, where cornfields and pasturages prevail, lies in the extreme south; then to the north, on both sides of the boundary line, comes the "ante-Steppe," the zone in which fields prevail, but in which there are also some forests; farther north still is the zone in which fields and meadows are intermingled with forests; and beyond that again is the forest zone. The actual distribution of fields, forests, and meadows in European Russia and Poland is best seen from the following table:—

	European Russia.		Poland.	
	Acres.	Percentage.	Acres.	Percentage.
Fields and fallow	287,868,000	26	15,933,000	53
Meadows and pasturages	174,958,000	16	5,605,000	19
Forests	425,622,000	39	6,763,000	23
Uncultivated	210,060,000	19	1,631,000	5
Total	1,098,508,000	100	29,932,000	100

The proportion of land under crops varies very much in different parts of European Russia; it is 74 and 73 per cent. in Kursk and Tula, from 45 to 70 per cent. in the two above-mentioned southern zones, from 30 to 50 per cent. in Middle Russia, from 20 to 30 per cent. in Western Russia and in the southern Urals (Ufa); from 10 to 20 per cent. in the lake region, and less than 10 per cent. in Northern and North-Eastern Russia. The highest standard of agriculture is met with in Poland and in the western governments (Baltic, Lithuanian, and South-Western), and the standard gets lower and lower as one moves eastwards. Rye and oats are the chief cereal in Central and North Central Russia. Wheat is sown in only small quantities in Western and Central Russia, but is the chief crop in the southern prairie belt. In the far north barley takes the place of oats and partly of rye. Buckwheat is sown everywhere in the middle zone, but millet takes its place to the south of the above-mentioned boundary, and maize in the extreme south-west (Podolia, Bessarabia, and Kherson), and in the Caucasus. Potatoes are extensively cultivated in the west. The use of agricultural machinery is rapidly spreading, reapers and steam threshing-machines being largely used in the "black earth" prairie belt.

Taking the whole empire, nearly six-tenths of the cultivated

area is sown every year with cereals, the areas under which in the various divisions of the empire in 1900 are shown in the following table:[1]—

Region.	Acres.
European Russia	178,963,600
Poland	10,770,000
Four governments of North Caucasia * . .	10,470,700
Four governments of Siberia † . . .	9,182,000
Four provinces of Central Asia ‡ . . .	2,131,400
Total, in 72 governments .	211,517,700

* Kuban, Stavropol, Terek, and Tchernomorsk.
† Tobolsk, Tomsk, Yeniseisk, and Irkutsk.
‡ Akmolinsk, Semipalatinsk, and Turgai; Semiryechensk of Turkestan.

The crops are now given in official documents in units of weight, and the quarter of each different grain having a different weight, which varies with the year and even the region, it is not easy to compare the present returns with those of former years. The crops of 1900, which were 10 per cent. in excess of the average crops of the preceding years, are given in the following table, in thousands of cwt.:—

Region.	Crops, in Thousands of Cwt.						
	Wheat.	Rye.	Barley.	Oats.	Various.*	Total.	Potatoes.
European Russia .	170,999	414,413	80,243	212,586	48,895	927,225	332,428
Poland . . .	10,565	33,812	7,891	•14,639	2,001	68,908	106,289
North Caucasia † .	30,508	3,751	11,617	5,005	5,035	55,915	7,151

Total . .	226,607	460,074	101,564	243,917	59,275	1,091,436	515,508

* Mixed rye and wheat, buckwheat, and millet.
† Kuban, Stavropol, Terek, and Tchernomorsk.
‡ Irkutsk, Tobolsk, Tomsk, and Yeniseisk.
§ Akmolinsk, Semipalatinsk, Semiryechensk, and Turgai.

The yield of maize was 12,785,000 cwt. in European Russia, and 4,342,000 in northern Caucasia; the aggregate yield of peas, lentils, and beans was 18,942,000 cwt. The hay crop in 1900 was as follows:—

Region.	Area in Acres.	Yield in Thousands of Cwt.
European Russia . .	69,796,000	744,961
Poland	2,427,000	36,652
North Caucasia . .	6,684,000	77,915
Siberia	9,080,000	83,146
Steppes	2,511,000	24,425
Total .	90,498,000	967,099

Beetroot for sugar is especially cultivated in Poland, the western provinces (Kiev, Podolia, Volhynia, and Kharkov), and the south-western (Bessarabia, Kherson), as also to some extent in South Central Russia; 1,454,000 acres were under beet in 1901, and 754,760 tons of refined sugar were obtained in 277 sugar works. Tobacco is widely grown in the south (1,672,000 cwt.), and the hop crop of 1897 was 107,000 cwt. Flax is grown chiefly in Central and North-Western Russia, the yearly crop being about 10,780,000 cwt. of flax (half of which is exported) and 12,932,500 cwt. of linseed. Hemp is cultivated both for fibre (yearly yield, 5,014,000 cwt.) and seed (6,245,000 cwt.). Various other oil seeds are also grown, the yearly production of various oils being estimated at 1,000,000 cwt. The vine is grown as far north as 49° N. (Bessarabia, Crimea, Don, besides Caucasia and Central Asia), the yearly production of wine being 19,990,000 gallons in Russia, 17,000,000 in Caucasia, and 116,000 in Central Asia. Market-gardening and fruit-growing are extensively engaged in in portions of Central and South Russia, and very important works have lately been established for the manufacture of jam, pickles, and canned fruit. Turkestan, Khiva, and Bokhara supply every year about 1,160,000 cwt. of cleansed cotton, and Transcaucasia about 20,000 cwt.

The live stock in the empire in 1896 is estimated by Russian statisticians to have been as follows:—

Region.	Thousands of Head.							
	Horses.	Horned Cattle.	Sheep.	Pigs.	Goats	Camels.	Reindeer.	Total.
European Russia and Poland	20,867	27,922	48,000	10,742	1,393	26	263	109,213
Finland	271	1,103	1,067	197	14	..	130	2,782

* Incomplete data, the figures for sheep and goats are approximate only.
† Data incomplete.

Thus in European Russia and Poland there were in 1896 23 horses, 31 horned cattle, 53 sheep, and 12 swine to every 100 inhabitants. However, even within Russia proper the live stock is very unequally distributed, there being 109 horned cattle to every 100 inhabitants in the Don province, 51 in Esthonia, and only 14 in Orel and Tula. From an enumeration taken in 41 provinces of European Russia in 1896, it appeared that 82 per cent. of the total number of horses belonged to the peasants, but that 28 per cent. of the peasant households did not own any horses, and that there were 1820 private horse-breeding establishments with about 40,000 head. The most common kind of animal is the small, weak, peasant horse; the best are found in Poland, the western governments, and in the Steppe provinces. The South Russian "bityugs" are a fine breed, and so are the Cossack horses, while the Kirghiz breed in South-Eastern Russia are especially appreciated for their endurance. Finland ponies are largely exported. The best races of horned cattle are found in Poland, the western provinces, Little Russia, and the Far North (Holmogory). Swine-breeding is in a primitive condition. Of the nearly 75,000,000 sheep kept in Russia, only about 15,000,000 belong to the fine merino breed; these yield, however, over 1,000,000 cwt. of fine wool annually; they are chiefly kept on the Black Sea prairies. The export of live stock is rapidly increasing—horses being exported to Germany, Austria, and Great Britain to the value of about £500,000 per annum, cattle to Turkey and China, sheep to France, China, and Turkey, and pigs to Germany (to the value of £325,000 annually). On the other hand, considerable quantities of cattle and sheep are imported from Central Asia. Modern dairy-farming is still new in Russia, and butter is still imported, chiefly from Finland; but it is also exported, and in increasing quantities, to Western Europe, being sent to Great Britain alone, in part *viâ* Copenhagen, to the value of £685,493 in 1900. Poultry-farming, for the supply of both the home and foreign markets, is being more and more extensively engaged in, and the export of eggs has of late developed enormously: on the average, 1,743,000,000 eggs, in each of the three years 1897–99, valued at £2,844,000, were sent out of the country.

Viewed as a whole, it must be confessed that agriculture stands at a very low level in Russia. Considerable progress was made in the fertile prairies bordering the Black Sea and the Sea of Azov, where modern agricultural machinery was largely introduced, and a very considerable number of machinery works, large and small, have grown up. But the famines which periodically visit large districts—especially in the fertile but dry prairie belt of South-Eastern Russia, and in some of the central provinces—are chiefly due to the primitive methods of husbandry employed. The misery of the peasants, who up to the present time have borne nearly all the burden of taxation, the lack of education, and the almost total absence of those institutions by means of which agricultural education is spread among the farmers in the United States, in France, and in Germany, have all hampered the development of agriculture. The general improvement of the agricultural population of the central provinces of European Russia is now the subject of a wide inquiry, from which it appears (in a summary published by A. D. Polyénoff) that within the years 1871 and 1899 the arrears in the payment of the direct taxes grew from 10 to 42 per cent. of the aggregate sum; the yearly sowings, taken per head of population, decreased by 35 per cent., and the number of horses, also per head of agricultural population, by 48 per cent., and so on—the result being a rapid growth of a totally destitute peasant class even in the most fertile provinces of European Russia. Within the last few years some efforts have been made by the Ministry of Agriculture to help the peasantry in education; but in 1899 there were only 114 agricultural and dairy schools (4 for women), with 5157 pupils; as was noticed under *Education*, farms and gardens have been widely established in connexion with the village schools; numerous agricultural societies (320, of which 80 are in the Baltic provinces) have been founded lately. The *zemstvos* have made a notable effort to improve the condition of agriculture by appointing agricultural councils and inspectors, establishing museums, meteorological stations, and depôts for the sale of agricultural machinery at cost price. Measures are also being

[1] *Résultats généraux de la Récolte en Russie en 1900.* St Petersburg, 1901.

taken to increase the very low productivity of the forests.[1] These cover a considerable area, as may be seen from the following table:—

Region.	Area under Forests. Square Miles.	Percentage of Total Area.
European Russia . . .	717,730	39·4
Poland	10,480	21·4
Finland	78,905	62·8
Caucasia *	29,605	16·3
Total . . .	836,720	38·4

* Without Erivan and Tchernomorsk.

According to more recent estimates, the areas under forests are —453,617,000 acres in European Russia, 7,358,000 acres in Poland, and 19,352,000 acres in Caucasia. Nearly 54,000,000 acres must, however, be excluded from the figures for European Russia and Poland as marsh land and land under lakes. The distribution of forests is very unequal in European Russia, the area covered by them in the various provinces varying from 89 per cent. of the total area in the north to 9 per cent. and even 2 per cent. in the south-east. The State is the chief owner of forests (almost exclusive owner in Arkhangelsk), and owns no less than 272,000,000 acres in European Russia and Poland (235,000,000 acres of good forests), while private persons own 108,000,000 acres, the peasant communities 43,000,000, and the Imperial family 13,500,000 acres.

Sericulture, which was in a flourishing condition in the 'sixties, both in the Caucasus and in Southern Russia, was reduced to a very low ebb in consequence of the silkworm disease, and was only renewed with any vigour towards the end of the 'eighties. At the beginning of the 20th century it was most developed in Transcaucasia (Kutais, Elisabethpol), and extended into Northern Caucasia; from 100,000 to 130,000 cwt. of cocoons, valued at £400,000 to £600,000, is obtained annually, and sent to Moscow (mainly) and France. Sericulture is taught in a number of special schools and in a great number of village schools. It is widely engaged in in Turkestan, and to some extent in the Transcaspian territory, Khiva, and Bokhara. Attempts are being made to re-establish the silkworm industry in South Russia, where at present only 800 to 1000 cwt. of cocoons are obtained per annum, and in Poland. Altogether about 250,000 cwt. of cocoons, representing about 13,000 cwt. of silk of the value of £850,000 to £900,000, are obtained annually in the Russian empire. The cotton plant is widely cultivated in Turkestan, 840,000 cwt. of cleaned cotton, representing 2,080,000 cwt. of raw cotton, being obtained in 1899; to this must be added 322,000 cwt. from Bokhara and Khiva, and 408,000 cwt. from Transcaucasia (1898).

Fishing.—Fish continues to form an important article of national food, and to provide an important part of the national income. Along the Murman coast of the Arctic Ocean and in the White Sea (where nearly 40,000,000 herrings are caught annually) the yearly produce is estimated at 370,000 cwt., of the value of about £140,000. In the Baltic Sea, as well as in the lakes of its basin (Ladoga, Onega, Ilmeñ, &c.), the yearly value is estimated at £200,000. Of anchovies alone 10,000,000 jars are prepared annually, while salted fish is the chief, next after bread, food of large masses of the population. The Black Sea fisheries yield 925,000 cwt., valued at £300,000 per annum. The value of the fish has much increased lately owing to the introduction of cold storage; as a result of the employment of this method of packing, the fish is now exported in a fresh state from the Black Sea to all parts of South-West Russia, and even to Moscow. The annual yield of the Azov Sea fisheries is valued at £600,000. In the Volga section of the Caspian Sea about 930,000,000 fish are caught annually, of a value of about £1,100,000; in the Ural section 836,500 cwt. of fish and 29,000 cwt. of caviare are obtained. The total value of the Caspian fisheries is estimated at £3,000,000 per annum. Taking the Lake Aral and Siberian river fisheries into account, it is estimated that altogether more than 1,100,000 tons of fish are obtained every year (in addition to 200,000 cwt. of caviare, 230,000 cwt. of fine conserves, and 1700 cwt. of glue), yielding a revenue to the State of £330,000, and requiring for its preservation over 200,000 tons of salt.[2] In addition, from 13,000 to 60,000 seals and about 200 whales are killed annually off the Murman coast.

Industry.—The growth of Russian industry is shown in the following table, which compares the returns for 1887 and 1897 of all factories throughout the empire of which the annual production was valued at more than 2000 roubles:—

Branch of Industry.	1887. Number of Workers.	1887. Yearly Returns. Roubles.	1897. Number of Factories.	1897. Number of Workers.	1897. Yearly Returns. Roubles.
Textiles . .	399,178	463,044,000	4,449	642,520	946,296,000
Food products .	205,223	375,286,000	16,512	255,357	648,116,000
Animal products .	38,876	79,495,000	4,238	64,418	132,058,000
Wood . . .	30,703	25,688,000	2,357	86,273	102,897,000
Paper . . .	19,491	21,030,000	532	46,190	45,490,000
Chemical products	21,134	21,059,000	769	35,320	59,555,000
Ceramics . .	67,346	28,965,000	3,413	143,291	82,590,000
Mining and metals	390,915	156,012,000	3,412	544,333	303,749,000
Metal goods . .	103,300	112,618,000	2,412	214,311	310,626,000
Various . . .	41,882	50,852,000	935	66,249	117,767,000
Total .	1,318,048	1,334,049,000	39,059	2,098,262	2,839,144,000

The following table shows the growth of the mining industry in greater detail:—

Metal.	1887. Production.	1887. Value. Roubles.	1897. Production.	1897. Value. Roubles.
Gold . . .	34,840 kilos	40,413,000	38,182 kilos	43,072,000
Silver . . .	15,020 ,,	..	4,390 ,,	386,000
Platinum . .	4,406 ,,	2,018,000	5,586 ,,	3,095,000
Copper . .	4,783 tons	3,504,000	5,192 tons	4,639,000
Zinc . . .	3,720 ,,	884,000	4,505 ,,	1,373,000
Lead . . .	983 ,,	120,000	442 ,,	58,000
Mercury . .	64 ,,	..	623 ,,	..
Salt . . .	1,157,000 ,,	5,649,000	1,562,000 ,,	6,778,000
Coal . . .	4,534,000 ,,	13,839,000	11,203,000 ,,	38,045,000
Pig iron . .	594,000 ,,	25,405,000	1,848,000 ,,	77,731,000
Iron . . .	362,000 ,,	35,388,000	490,000 ,,	50,033,000
Steel . . .	157,000 ,,	22,094,000	920,000 ,,	125,942,000
Raw naphtha .	2,733,000 ,,	5,006,000	7,831,000 ,,	36,558,000
Naphtha products	..	18,317,000	..	45,735,000

Nearly all these figures showed an increase in 1899, the output being: gold 38,776, silver 4637, and platinum 5962 kilograms; copper 6495 (1898), zinc 7419, lead 238, mercury 357, salt 1,643,000, coal 13,705,000, pig iron 2,680,000, iron 573,000, steel 1,314,000, and naphtha 8,827,000 tons; also manganese ore, 319,400 tons. Though still in its infancy, the chemical industry is making rapid progress in Russia. In 1890 there were only two soda works, but seven years later there were ten such works and about thirty other chemical works, which yielded in 1899 over 82,000 tons of carbonated soda. With the natural resources of Russia, and the awakening interest of its people in the industrial possibilities that lie before them, this branch of industry, as well as that connected with the utilization of the vast supplies of raw naphtha still waiting to be tapped, is sure to advance by leaps and bounds. Unfortunately, the extravagant prices which Russia has to pay for iron and all iron goods, owing to its prohibitive tariffs, combined with the obstacles laid in the way of spreading education, hamper the development of all industries.[3] The cotton industry uses nearly 270,000 tons of raw cotton annually, 100,000 tons of which are supplied by Central Asia and Transcaucasia: it represents 6,500,000 spindles and 200,000 power looms, and excels chiefly in the production of red and printed cottons. Since 1880 power looms have been made in Russia itself. And while the total value of all imports in cottons is only about 5,900,000 roubles, the exports to Persia, China, and Turkey are valued at 8,000,000 roubles; every year, too, the home market absorbs more and more cotton goods. The woollen industry is rapidly growing, but it cannot yet satisfy the local demands, and even raw wool continues to be imported. In the flax mills there are 300,000 spindles and 15,000 power looms. The tendency is to produce the finest flax tissues as well as the coarser. Of the 200,000 tons of hemp grown every year, nearly 50,000 tons are retained for home use, and, further, about 1500 tons of Italian and Manila hemp and 18,500 tons of jute are imported for the mills. The silk mills employ silk obtained from the Caucasus, Italy, and France. The sudden growth of the silk industry will be seen when it is stated that whereas in 1879–88 the import of all sorts of raw silk averaged only 79 tons per annum, in 1896–98 the average yearly importation was 1248 tons. The growth of the sugar industry is shown by the

[1] See *Russian Forests*, published by the Ministry of Agriculture, 1900; *Report of the Forestry Department* for 1899; *Works (Trudy)* of the Committee of Prof. Dokuchaeff, 1898; *Irrigation, Industrial Hunting*, by A. Silantieff, and a number of other official publications of the Ministry of Agriculture.

[2] See *Researches into the State of Fisheries in Russia*, 9 vols., edited by Minister of Finance, 1896 (Russian); Kusnetzow's *Fischerei und Thiererbeutung in den Gewässern Russlands*, 1898.

[3] See *The Iron Industry of the World*, *The Cotton Industry of Russia*, and *The Influence of Railways upon Agriculture, Industry, and Trade*, by Anton Radzig. St Petersburg, 1891–96.

fact that in 1888–93 the average annual production of raw sugar was 925,540 metric tons, and of the refineries, 444,520 tons; in the years 1894–98 the figures were 1,159,200 and 620,640 tons respectively; while in 1900 the refineries yielded 670,680 tons in European Russia and 74,920 tons in Poland. In 1899–1900 there were in the empire 2025 distilleries, which used 2,500,000 tons of cereals and 1,800,000 tons of potatoes, the yield being 86,094,000 gallons of pure alcohol. The yearly consumption of spirits per head of population, which was 13·6 pints in 1889, steadily decreased to 10·8 pints in 1898. Of beer, which is chiefly made in Poland and the Baltic provinces, 124,080,000 gallons were produced in 1897–98. Tanneries exist in nearly every province of Russia, but it is especially at Warsaw and St Petersburg, and after these at Moscow, that the largest and best modern tanneries and shoe and glove factories are established. The governments of Orel (shoe factories), Kherson, Vyatka, Nijni Novgorod, Perm, Kiev, and Kazañ rank next in this respect. Furniture factories are greatly developing; and in 1899 the paper industry was represented by 184 factories in Russia and Poland and 12 in Finland, the yearly production having increased in Finland from 12,000 metric tons in 1890 to 27,200 tons in 1899, and in Russia from 80,000 tons in 1887 to 192,000 tons in 1899. The growth of mechanical works has also been great, as may be seen from the following table:—

Year.	Factories.	Number of Workers.	Yearly Returns.
1870	198	30,000	£2,900,000
1885	336	42,772	4,100,000
1897	682	120,339	14,200,000

The yearly production includes about 400,000 tons of rails per annum, and 700 railway steam engines, 66,000 tons of iron and steel wire, 23,000 tons of pipes.[1]

The relative industrial importance of the leading manufacturing provinces of the Russian Empire is shown in the following table, which gives the returns for 1897 of all factories and mining industries in the governments enumerated (P stands for Poland, and C for Caucasia):—

	Millions of Roubles.		Millions of Roubles.
Moscow	380·0	Kostroma	61·1
St Petersburg . . .	289·6	Kharkov	44·5
Piotrkow (P) . . .	256·8	Nijni-Novgorod . .	44·1
Vladimir . . .	206·6	Don	39·5
Ekaterinoslav . . .	155·7	Orel	38·7
Warsaw (P) . . .	106·3	Podolia	37·1
Livonia	88·2	Saratov	34·4
Perm	87·1	Tver	32·7
Baku (C) . . .	82·6	All others less than 30,000,000 roubles.	
Kiev	74·4		
Kherson	62·8		

Far from being destroyed by the competition of the factories, the domestic industries, while undergoing certain modifications required by the new conditions, have well maintained their ground, even new branches of petty trade having sprung up in some districts. Among these new branches the manufacture of agricultural machinery (thrashing machines in Ryazan, Vyatka, and Perm; ploughs in Smolensk, &c.) deserves notice. Cotton-weaving alone, in the Moscow central region, still gives occupation to more than 60,000 families; and furniture-making has lately developed on a large scale in several provinces.

Commerce.—It is impossible to give even an approximate estimate of the value of the internal trade in Russia. The chief fairs are held at Nijni-Novgorod and Irbit in Siberia. The yearly returns of goods actually sold at these two fairs are as follows (000 omitted):—

Fair.	1881–90.	1891–95.	1896.	1897.	1898.	1899.
	Roubles.	Roubles.	Roubles	Roubles.	Roubles.	Rouble
Nijni-Novgorod	187,127	151,958	153,338	142,664	128,721	170,000
Irbit .	56,700	36,200	41,000	41,000	30,300	31,600

The value of the commercial transactions which take place at both these fairs greatly exceeds the above figures. Altogether, no less than 16,604 fairs are held in Russia (European Russia 14,048, Poland 1877, Caucasia 143, Siberia 447, and Central Asia 89). Of these, 30 show returns of goods imported to the value of over 1,000,000 roubles each, 41 from 500,000 to 1,000,000, and 437 from 100,000 to 500,000 roubles each, while 7363 fairs show returns of less than 5000 roubles each.

On 1st January 1898 there were in Russia 1146 shareholders' companies, with a capital of 2,061,000,000 roubles, of which 938 were industrial and 208 commercial, banking, and insurance companies. 115, with an aggregate capital of 337,000,000 roubles, were foreign companies; 23 more foreign companies (capital 96,000,000 roubles) were formed in 1898.

The external trade of the Russian empire (bullion not included, nor the external trade of Finland) since the year 1886 is shown in the following table:—

Year.	Exports.	Imports.
	Paper Roubles.	Paper Roubles.
1886–90, average . .	675,200,000	415,100,000
1891–95, ,, . .	636,515,000*	468,961,000
1896	688,572,000	589,810,000
1897	726,624,000	559,998,000
1898	732,673,000	617,459,000
1899	626,475,000	642,778,000
1900†	688,552,000	572,184,000

* 1891 and 1892, famine years.
† European frontier and trade with Finland only.

The chief exports pass across the "European frontier," which includes the Black Sea ports of the Caucasus. The relative importance of trade with Europe, Finland, and Asia is shown by the following table:—

	1895.	1896.	1897.	1898.	1899.

[1] For all information concerning the development and geographical distribution of industries, see Kovalevsky's *La Russie à la fin du xixe siècle*, Paris, 1900 (official publication): B. F. Brandt's *Foreign Capital: Its Influence*, 2 parts, 1899 (Russian); and numerous official publications of the Ministries of Finance, Agriculture, and Trade.

The chief articles of export across the "European frontier" are grain and flour, the figures for which were 147,468,860 cwt., valued at 370,463,000 roubles, in 1898; 111,143,000 cwt., valued at 259,022 roubles, in 1899; and 135,040,000 cwt., valued at 304,698 roubles, in 1900. Then come flax and hemp to the value of 58,518,000 roubles, in 1900; dairy produce and eggs, 45,292,000 roubles; timber and wooden goods, 58,384,000 roubles; naphtha and naphtha oils, 45,973,000 roubles; animals, 17,900,000 roubles; oil-cakes, 15,540,000 roubles; bristles, hair, and feathers, 7,343,000 roubles; sugar, 16,330,000 roubles; and manufactured goods, 19,495,000 roubles. The chief imports in 1900 across the same frontier were machinery, 76,665,000 roubles; raw cotton, 63,201,000; raw wool and wool yarn, 21,759,000 roubles; raw silk and silk yarn, 13,282,000 roubles; raw metals, 36,673,000 roubles; metal goods, 29,022,000 roubles; coal and coke, 42,589,000 roubles; chemicals and colours, 23,586,000 roubles; and tea, 23,639,000 roubles.

In the trade with Asia the chief exports were, in 1898, naphtha and naphtha oils, 21,260,000 roubles; cereals, 16,125,000 roubles; cottons, 9,023,000 roubles; and sugar, 6,309,000 roubles; while the chief imports were tea, 24,496,000 roubles; textiles, 5,578,000 roubles; and machinery (to Russian Manchuria), 4,716,000 roubles.

The chief external trade was formerly with Great Britain, but is now with Germany, the exports to which—chiefly grain, flax, timber, eggs, hemp, live fowls, tea, hides, bristles, and linseed—amounted to 187,515,000 roubles in 1900, while the imports from which—chiefly machinery, woollen yarn, raw wool, and iron goods—amounted to 215,416,000 roubles in the same year. The discrepancy between the British and the Russian returns of the trade between the two countries is so great as to be worthy of notice. These differences for the 20 years ending 1900 are exemplified in the following table:—

	British Returns.		Russian Returns.	
	Exported to Russia.	Imported from Russia.	Imported from Great Britain.	Exported to Great Britain.
	£*	£*	Paper Roubles.*	Paper Roubles.*
1881–90 average	7,783,000	19,687,000	108,850,000	198,350,000
1891–95 average	9,931,000	21,429,000	111,039,000	160,744,000
1896	7,185,180	22,667,440	111,041,000	160,903,000
1897	7,513,160	22,284,360	102,016,000	150,908,000
1898	9,227,970	19,489,510	115,082,000	139,906,000
1899	11,720,330	18,711,170	129,353,000	129,168,000
1900	11,001,300	21,974,952	128,176,000	145,564,000

* One pound sterling=9·87, or practically 10, paper roubles.

The chief exports to the United Kingdom are grain, flax, hemp, and eggs, while the chief imports are machinery, metals, coal, and raw cotton in transit. France ranks third in the foreign trade of Russia; in 1900 the exports thereto (grain, timber, oil seeds, and flax) were valued at 57,444,000 roubles, and the imports therefrom (wine, raw silk, and wool) at 31,228,000 roubles. The trade with Holland has been on the increase, but the exports to that country, which reached 72,257,000 roubles in 1898, only totalled 69,192,000 roubles in 1900. In the trade with the United States the goods exported from Russia are insignificant, but those imported into Russia (chiefly machinery) reached 50,059,000 roubles in 1898 and 43,615,000 roubles in 1900.[1] The trade with China (imports therefrom 40,000,000 roubles on the average; exports thereto only 5,000,000 roubles) is mainly dependent on the importation of tea (32,000,000 roubles in 1897); some cottons and silks are also imported. Considerable quantities of Ceylon teas were imported lately. Even in her trade with Persia, Russia imports more fruit, rice, cotton, silks, and woollens (to the value of 18,000,000 roubles) than she exports (15,000,000 roubles, half of which represents sugar, and the remainder cottons and other manufactured goods). It may be added that in international trade Russia occupies the sixth place (after Great Britain, Germany, the United States, France, and Holland), her commerce representing 6 per cent. of that of the world.

On 1st January 1899 the mercantile fleet of Russia, including Finland, consisted of only 657 steamers of 299,700 tons, and 2143 sailing vessels of 254,100 tons. In 1900 the ports of the Baltic, the Black and the White Seas, were entered by 10 573 vessels above 20 tons, 8,549,000 tons in all; but only 5518 vessels (4,097,000 tons) came loaded with goods, the remainder coming with ballast to take goods for export. The Caspian ports were entered by 943 vessels, and Vladivostok by 384 vessels, only one-tenth of which were under the Russian flag. And 66,723 vessels engaged in the coasting trade entered the Russian ports in 1898. Inland navigation, however, is, as in the United States, immense and quite out of proportion to the foreign shipping. The total length of rivers available for carrying trade throughout the empire is 101,000 miles, of which 46,000 miles are used for floating rafts, and 55,000 are navigable by craft; 33,000 miles are navigable by steamers. European Russia alone, without Finland, has 24,432 miles of navigable rivers (16,590 miles by steamers). There are, further, 507 miles of canals and 711 miles of canalized rivers. In 1895 the fleet on the rivers of Russia proper and Poland (on the Volga it had doubled in 10 years) numbered 2539 steamers, of 129,760 nominal horse-power and with an aggregate capacity of 198,000 tons (2894 steamers in 1897); there were also 20,580 other vessels, aggregating 8,504,300 tons. Both categories together employed no less than 118,297 persons. Nearly 125 steamers are added every year to this fleet (173, all built in Russia, in 1897), and about 5500 various vessels, of which the greater number are destroyed every year. In 1899, 167,204 vessels and 260,144 rafts were loaded at the river ports of Russia proper, the total weight of the merchandise thus transported being 30,380,000 tons (about 12,240,000 by raft), of a total estimated value—much below the real value—of 468,582,000 roubles. Timber, fuel wood, corn, and naphtha supply the chief loads (22,800,000 tons). The rivers of West Siberia were navigated in 1896 by 114 steamers of 5000 tons, and 369 barges; those of East Siberia (Lena, Yenisei) by 41 steamers of 2000 tons; and the Amur by 116 steamers of 4300 tons, and 145 barges.

Shipping and navigation.

A considerable number of new railways, some of which are of great importance to the empire, were built during the last twenty years of the 19th century. At the same time the chief lines of railways, which had been built by public companies with a State guarantee, and which represented a loss to the empire of about 30,000,000 roubles per annum, as well as a growing indebtedness, were bought by the State, which derives a small net profit from its railways, although several of the later lines, while imperative for State purposes must necessarily yield but a very small revenue, or be worked at a loss.

Railways.

On 1st January 1883 there were 14,316 miles of railways in Russia, Poland, and Caucasia, 734 miles in Finland, and 141 in the Transcaspian region—a total of 15,191 miles, of which 738 miles belonged to the State and the remainder to public companies. On 1st June 1900, 33,425 miles of railways were opened to traffic, 22,712 miles being owned by the State and 10,713 miles by public companies; there were also 2904 miles of line under construction (1110 miles owned by the State); and over and above all, 1600 miles in Manchuria and 1586 miles in Finland.

The most important of the new railways is the Trans-Siberian, of which the first section, Chelyabinsk to Omsk, was opened in December 1895, and which in 1901 was virtually completed right through to Sryetensk, on the Shilka, the head of navigation on the Shilka and the Amur, 2804 miles from Chelyabinsk and 4168 miles from Moscow, *viâ* Samara and Chelyabinsk. There is only one interruption in that line—Lake Baikal, the railway round the lake being under construction. At the Pacific end of the Trans-Siberian Railway a line connecting the Pacific town and fortress of Vladivostok with Khabarovsk, at the junction of the Amur and the Usuri, was first of all built, following the very thinly-inhabited valley of the Usuri, which, owing to natural conditions, can never become the seat of a numerous agricultural population. But it was soon found that the cost of the section required to complete the railway along this route, that is, of a line between Sryetensk and Khabarovsk, along the Shilka (240 miles) and the Amur (1320), would be enormous, while neither the wild mountainous tracts on the lower Shilka (Gazimur range) and upper Amur (high plateau), nor the marshy, often inundated region between Khabarovsk and the Little Khingan (250 miles), could ever be the seat of a numerous agricultural or mining population. Consequently a company was formed by the Russian Government in 1896 to construct, with the consent of the Chinese Government, a railway from Vladivostok right across Manchuria to Kaidalovo, a point in Transbaikalia on the Sryetensk line, near to Chita. This runs for 330 miles on Russian territory and for 951 miles on Manchurian territory, and passes through the Manchurian towns of Tsitsikar, Harbin on the Sungari, and Ninguta. Plans were also made for a branch line, from Kharbin to Port Arthur, *viâ* Bedune, Mukden, and Niuchwang. The first portion of the Trans-Manchurian railway, built by Russian engineers, with Chinese labour, and under the protection of Russian troops, was in a fair way of progress before the Boxer uprising; and though the troubled state of the country compelled operations to be suspended for some time in 1900–01, work was recommenced in the summer of the latter year. Both sections,

[1] According to the official returns of the U.S. Treasury Department, the total exports from the Russian empire to the United States in 1901 amounted to $7,034,421 (£1,406,884), and the imports into the Russian empire from the United States amounted to $9,545,904 (£1,909,181).

Kaidalovo–Vladivostok and Harbin–Port Arthur, are now (1902) virtually completed. At the same time, several secondary lines were built in connexion with the Trans-Siberian line. Chelyabinsk has also been connected by a transverse line with the Middle Urals Railway, which connects Perm, the head of navigation in the Volga basin, with Tyumen, the head of navigation on the Ob and Irtysh, passing through Ekaterinburg and other mining centres of the Middle Urals. Tomsk is now connected with the main line, and various lines are being built in the Urals. A railway has also been built to connect Perm with Kotlas, near the junction of the Sukhona with the Yug, at the head of the Northern Dvina. Throughout its length, which is 538 miles, it passes through a very thinly populated region, but it is hoped that it will provide an outlet for Siberian grain and other produce in the direction of the White Sea. The traffic along the Trans-Siberian line is rapidly growing, and in 1899 the exports had attained 280,000 tons, chiefly grain, butter, meat, cattle, hides, &c.

Another line of great strategic, and apparently of commercial, importance has been built across the Transcaspian territory to Fergana. Starting from Uzunada and Krasnovodsk, it runs first south-east to Merv (604 miles), with a branch line (194 miles) to Kushka, near Herat, then north-east across the desert to Charjui, on the Amur river, Bukhara, and the Russian fort Kattykurgan, and then to Samarkand, Kokand, and Andijan in Ferghana, 1267 miles from Merv, with a branch to Tashkent (204 miles), and another to New Marghilan and Kuva (about 50 miles). This great railway, 2319 miles long with the above-mentioned branches, was partly built by the military railway battalions, and has already become an important line of traffic for the export of raw cotton from Central Asia to Russia. A line of steamers runs from Uzunada in regular communication with the Caucasus at Baku. The Central Asian line is going to be connected now by another line of great importance, from Tashkent down the Syr-Daria to Kazalinsk, and thence to Orenburg.

A third line of great importance that has lately been completed is the junction line between the Transcaucasian railway—which runs from Batum and Poti to Baku, *viâ* Tiflis, with a branch line to Kars—and the railway system of Russia proper. This junction has been effected not across the main Caucasus Range, but at its eastern extremity, that is, *viâ* the Caspian ports of Baku and Petrovsk, which are connected with Vladikavkaz (Beslan junction). The Black Sea port of Novorossiysk, in Western Caucasia, having been connected with the Rostoff–Vladikavkaz line, has consequently also been brought into touch with the Russian railways. A number of important railways have also been built in Russia proper, especially on the western frontier. The Volga is now reached from Central Russia by seven lines of railways, including one to Kazañ, and three main lines radiate from the Volga eastwards (one to Siberia and two to the Ural river), while the upper Volga (Yaroslavl) is connected with Arkhangelsk by a line 523 miles long. A zone tariff was introduced on the Russian railways in 1894, and the cost of long journeys was considerably reduced; a journey of 1000 versts (623 miles) can be made third class at a cost of only about 17 shillings, while for less than twice as much 1990 miles can be covered. Since that time the passenger traffic has much increased and attained 91,537,000 in 1900. The rolling-stock on the Russian railways (9964 locomotives in 1899) still remains insufficient. It is estimated, however, that about 400 engines and 15,000 carriages can be built every year within Russia itself. The State railways in Finland represent a network comprising 1585 miles of line, and advance as far north as Uleåborg (continued to Torneå), Kuopio, and Ioensun.

Posts and Telegraphs.—The number of letters, books, periodicals, and parcels carried by the Russian post office internally has rapidly increased, from 344,320,000 in 1890 to 668,859,800 in 1899, while in the same time the foreign pieces of mail carried increased from 44,320,000 to 79,700,000. The length of telegraph lines in 1899 in the Russian empire was 98,590 miles (18,719,460 messages, exclusive of railway telegrams), and of telephone lines 45,977 miles.

AUTHORITIES.—The *Russkiy Encyclopedicheskiy Slovar*, edited by BROCKHAUS and EFRON, was begun in 1890, with the idea of giving a Russian version of Brockhaus's *Conversations Lexikon*, but from the very first volumes it became a monumental encyclopædia, to which all the best Russian men of science contributed; it is, indeed, an inexhaustible source of information on everything Russian.—A general popular description of Russia entitled *Rossiya*, containing excellent geographical, geological, and other descriptions of separate regions, and very well chosen illustrations, was begun in 1899 by a number of young Russian geographers and naturalists, under the editorship of V. P. SEMENOFF and the general supervision of P. P. SEMENOFF and V. I. LAMANSKIY. Two volumes of this excellent publication had been issued up to 1901.—Besides the official publications mentioned in the ninth edition and in this article, several volumes of statistics have been published, in English and French, in connexion with the Exhibitions of Chicago and Paris, of which *La Russie à la fin du xixᵉ siècle*, under the editorship of M. W. KOVALEVSKY, is especially worthy of notice. See also NORMAN. *All the Russias.* 1902. (P. A. K.)

RECENT HISTORY.

In the history of Russia the period extending from 1882 to 1902 was much less eventful than the thirty years immediately preceding. The reign of Alexander II. (1855–81) had been a time of important administrative reforms and of great economic, social, and intellectual changes in the life of the nation. Serfage had been abolished, the emancipated peasantry had been made communal proprietors of the soil, a democratic system of rural and municipal self-government for local affairs had been introduced, the tribunals of all degrees had been radically reorganized, means had been taken for developing more energetically the vast natural resources of the country, public instruction had received an unprecedented impetus, a considerable amount of liberty had been accorded to the press, a Liberal spirit had been suddenly evoked and had spread rapidly among all sections of the educated classes, a new imaginative and critical literature dealing largely with economic, philosophical, and social questions had sprung into existence, and for a time the young generation fondly imagined that Russia, awakening from her traditional lethargy, was about to overtake, and soon to surpass, on the path of national progress, the more advanced nations of western Europe. These sanguine expectations were not fully realized. The economic and moral condition of the peasantry was not much improved, and in many districts there were signs of positive impoverishment and demoralization. Local self-government, after a short period of feverish and not always well-directed activity, showed symptoms of organic exhaustion. The reformed tribunals, though incomparably better than their predecessors, did not give universal satisfaction. In the imperial administration the corruption and long-established abuses which had momentarily vanished began to reappear. Industrial enterprises did not always succeed. Education produced many unforeseen and undesirable practical results. The liberty of the press not unfrequently degenerated into licence. The Liberal spirit, which had at first confined itself to demanding feasible reforms, soon soared into the region of Socialistic dreaming and revolutionary projects. In short, it became only too evident that there was no royal road to national prosperity, and that Russia, like other nations, must be content to advance slowly and laboriously along the rough path of painful experience. In these circumstances sanguine enthusiasm naturally gave way to despondency, and the reforming zeal of the Government was replaced by tendencies of a decidedly reactionary kind. Already in the last years of the reign of Alexander II. these tendencies had found expression in ukases and ministerial circulars, and zealous Liberalism was more and more discountenanced in the official world. Partly from a feeling of despondency, and partly from a conviction that the country required rest in order to judge the practical results of the reforms already accomplished, the Tsar refrained from initiating any new legislation of an important kind, and the Government gave it to be understood that the period of radical reforms was closed.

Results of changes during reign of Alexander II.

In the younger ranks of the educated classes this state of things produced much dissatisfaction, which soon found expression in revolutionary agitation. At first the agitation was of an academic character, and was dealt with by the press Censure, but it gradually took the form of secret association, and the police had to interfere. There were no great, well-organized secret societies, but there were

many small groups, composed chiefly of male and female students of the universities and technical schools, which worked independently for a common purpose. That purpose was the overthrow of the existing régime and the reorganization of society on Collectivist principles. Finding that the walls of Autocracy could not be overturned by blasts of revolutionary trumpets, the young enthusiasts determined to seek the support of the masses, or, as they termed it, "to go in among the people" (*idti v narod*). Under the disguise of doctors, midwives, teachers, governesses, factory hands, or common labourers, they sought to make proselytes among the peasantry and the workmen in the industrial centres by revolutionary pamphlets and oral explanations. For a time the propaganda had very little success, because the uneducated peasants and factory workers could not easily understand the phraseology and principles of scientific Socialism; but when the propagandists descended to a lower platform and spread rumours that the Tsar had given all the land to the peasants, and that the proprietors were preventing his benevolent intentions from being carried into effect, there was a serious danger of agrarian disturbances, and energetic measures were adopted by the authorities. Wholesale arrests were made by the police, and many of the accused were imprisoned or exiled to distant provinces, some by the regular judicial procedure, and others by so-called "administrative procedure," without trial. The activity of the police and the sufferings of the victims naturally produced intense excitement and bitterness among those who escaped, and a secret body calling itself the Executive Committee announced in its clandestinely printed organs that those who distinguished themselves by endeavouring to suppress the propaganda would be removed. A number of officials were condemned to death by this secret terrorist tribunal, and in some cases its sentences were carried out. General Mezentsof, the head of the gendarmerie which fulfilled the functions of political police, was assassinated in open daylight in one of the principal streets of St Petersburg, and in the provinces a good many officials of various degrees shared the same fate. As these terrorist measures had quite the opposite of the desired effect, repeated attempts were made on the life of the Emperor. In April 1879 a man called Solovieff fired six shots from a revolver at his Majesty at close quarters. In the following December an attempt was made to blow up the imperial train near Moscow, and in February 1880 a number of conspirators caused an explosion of dynamite under the dining-room of the Winter Palace, by which ten persons were killed and thirty-four wounded, and the imperial family narrowly escaped by not having sat down to dinner punctually. At last, on 13th March 1881, the carefully-laid plans of the conspirators were successful. When driving home from a military parade, near the Winter Palace, Alexander II. was terribly wounded by the explosion of several small bombs, and died shortly afterwards.

Revolutionary movements.

Death of Alexander II.

Finding repressive police measures insufficient to suppress the revolutionary movement, Alexander II. had entertained the idea of giving a certain satisfaction to moderate Liberal opinion without restricting his autocratic power. With this object in view he had appointed General Loris-Melikoff, who was credited with Liberal views, minister of the interior, and on the morning of his death he had signed a ukase creating several commissions, composed of high official personages and eminent private individuals, who should prepare reforms in various branches of the administration. His son and successor Alexander III. (1881–94), who had never shown much sympathy with Liberalism in any form, entered frankly on a reactionary policy, which was pursued consistently during the whole of his reign. He could not, of course, undo the great reforms of his predecessor, but he amended them in such a way as to counteract what he considered the exaggerations of Liberalism. Local self-government in the village communes, the rural districts, and the towns was carefully restricted, and placed to a greater extent under the control of the regular officials. The reformers of the previous reign had endeavoured to make the emancipated peasantry administratively and economically independent of the landed proprietors; the Conservatives of this later era, proceeding on the assumption that the peasants did not know how to make a proper use of the liberty prematurely conferred upon them, endeavoured to re-establish the influence of the landed proprietors by appointing from amongst them "land-chiefs," who were to exercise over the peasants of their district a certain amount of patriarchal jurisdiction. The reformers of the previous reign had sought to make the new local administration (*zemstvo*) a system of genuine rural self-government and a basis for future parliamentary institutions; these later Conservatives transformed it into a mere branch of the ordinary State administration, and took precautions against its ever assuming a political character. Even municipal institutions, which had never shown much vitality, were subjected to similar restrictions. In short, the various forms of local self-government, which were intended to raise the nation gradually to the higher political level of western Europe, were condemned as unsuited to the national character and traditions, and as productive of disorder and demoralization. They were accordingly replaced in great measure by the old autocratic methods of administration, and much of the administrative corruption which had been cured, or at least repressed, by the reform enthusiasm again flourished luxuriantly.

Reaction under Alexander III.

In a small but influential section of the educated classes there was a conviction that the revolutionary tendencies, which culminated in Nihilism and Anarchism, proceeded from the adoption of cosmopolitan rather than national principles in all spheres of educational and administrative activity, and that the best remedy for the evils from which the country was suffering was to be found in a return to the three great principles of Nationality, Orthodoxy, and Autocracy. This doctrine, which had been invented by the Slavophils of a previous generation, was early instilled into the mind of Alexander III. by M. Pobiedonostsef (*q.v.*), who was one of his teachers, and later his most trusted adviser, and its influence can be traced in all the more important acts of the Government during that monarch's reign. His determination to maintain autocracy was officially proclaimed a few days after his accession. Nationality and Eastern Orthodoxy, which are so closely connected as to be almost blended together in the Russian mind, received not less attention. Even in European Russia the regions near the frontier contain a great variety of nationalities, languages, and religions. In Finland the population is composed of Finnish-speaking and Swedish-speaking Protestants; the Baltic provinces are inhabited by German-speaking, Lett-speaking, and Esth-speaking Lutherans; the inhabitants of the south-western provinces are chiefly Polish-speaking Roman Catholics and Yiddish-speaking Jews; in the Crimea and on the Middle Volga there are a considerable number of Tatar-speaking Mahommedans; and in the Caucasus there is a conglomeration of races and languages such as is to be found on no other portion of the earth's surface. Until recent times these various nationalities were allowed to retain unmolested the language, religion,

and peculiar local administration of their ancestors, but when the new nationality doctrine came into fashion attempts were made to spread among them the language, religion, and administrative institutions of the dominant race. In the reigns of Nicholas I. and Alexander II. these attempts were merely occasional and intermittent; under Alexander III. they were made systematically and with very little consideration for the feelings, wishes, and interests of the people concerned. The local institutions were assimilated to those of the purely Russian provinces; the use of the Russian language was made obligatory in the administration, in the tribunals, and to some extent in the schools; the spread of Eastern Orthodoxy was encouraged by the authorities, whilst the other confessions were placed under severe restrictions; foreigners were prohibited from possessing landed property, and in some provinces administrative measures were taken for making the land pass into the hands of Orthodox Russians. In this process some of the local officials displayed probably an amount of zeal beyond the intentions of the Government, but any attempt to oppose the movement was rigorously punished. Of all the various races the Jews were the most severely treated. The great majority of them had long been confined to the western and south-western provinces. In the rest of the country they had not been allowed to reside in the villages, because their habits of keeping vodka-shops and lending money at usurious interest were found to demoralize the peasantry, and even in the towns their number and occupations had been restricted by the authorities. But, partly from the usual laxity of the administration and partly from the readiness of the Jews to conciliate the needy officials, the rules had been by no means strictly applied. As soon as this fact became known to Alexander III. he ordered the rules to be strictly carried out, without considering what an enormous amount of hardship and suffering such an order entailed. He also caused new rules to be enacted by which his Jewish subjects were heavily handicapped in education and professional advancement. In short, complete Russification of all non-Russian populations and institutions was the chief aim of the Government in home affairs.

In the foreign policy of the empire Alexander III. likewise introduced considerable changes. During his father's reign its main objects were: in the West, the maintenance of the alliance with Germany; in South-Eastern Europe, the recovery of what had been lost by the Crimean war, the gradual weakening of the Sultan's authority, and the increase of Russian influence among the minor Slav nationalities; in Asia, the gradual but cautious expansion of Russian domination. In the reign of Alexander III. the first of these objects was abandoned. Already, before his accession, the bonds of friendship which united Russia to Germany had been weakened by the action of Bismarck in giving to the cabinet of St Petersburg at the Berlin Congress less diplomatic support than was expected, and by the Austro-German treaty of alliance (October 1879), concluded avowedly for the purpose of opposing Russian aggression; but the old relations were partly re-established by secret negotiations in 1880, by a meeting of the young Tsar and the old Emperor at Danzig in 1881, and by the meeting of the three Emperors at Skiernevice in 1884, by which the Three Emperors' League was reconstituted for a term of three years (see EUROPE: *Recent History*). Gradually, however, a great change took place in the Tsar's views with regard to the German alliance. He suspected Bismarck of harbouring hostile designs against Russia, and he came to recognize that the permanent weakening of France was not in accordance with Russian political interests. He determined, therefore, to oppose any further disturbance of the balance of power in favour of Germany, and when the treaty of Skiernevice expired in 1887, he declined to renew it. From that time Russia gravitated slowly towards an alliance with France, and sought to create a counterpoise against the Triple Alliance of Germany, Austria, and Italy. The Tsar was reluctant to bind himself by a formal treaty, because the French Government did not offer the requisite guarantees of stability, and because he feared that it might be induced, by the prospect of Russian support, to assume an aggressive attitude towards Germany. He recognized, however, that in the event of a great European war the two nations would in all probability be found fighting on the same side, and that if they made no preparations for concerted military action they would be placed at a grave disadvantage in comparison with their opponents of the Triple Alliance, who were believed to have already worked out an elaborate plan of campaign. In view of this contingency the Russian and French military authorities studied the military questions in common, and the result of their labours was the preparation of a military convention, which was finally ratified in 1894. During this period the relations between the two Governments and the two countries became much more cordial. In the summer of 1891 the visit to Kronstadt of a French squadron under Admiral Gervais was made the occasion for an enthusiastic demonstration in favour of a Franco-Russian alliance; and two years later (October 1893) a still more enthusiastic reception was given to the Russian Admiral Avelan and his officers when they visited Toulon and Paris. But it was not till after the death of Alexander III. that the word "alliance" was used publicly by official personages. In 1895 the term was first publicly employed by M. Ribot, then president of the council, in the Chamber of Deputies, but the expressions he used were so vague that they did not entirely remove the prevailing doubts as to the existence of a formal treaty. Two years later (August 1897), during the official visit of M. Félix Faure to St Petersburg, a little more light was thrown on the subject. In the complimentary speeches delivered by the President of the French Republic and the Tsar, France and Russia were referred to as allies, and the term "nations alliées" was afterwards repeatedly used on occasions of a similar kind.

Foreign policy.

In south-eastern Europe Alexander III. adopted an attitude of reserve and expectancy. He greatly increased and strengthened his Black Sea fleet, so as to be ready for any emergency that might arise, and in June 1886, contrary to the declaration made in the Treaty of Berlin (Art. 59), he ordered Batum to be transformed into a fortified naval port, but in the Balkan Peninsula he persistently refrained, under a good deal of provocation, from any intervention that might lead to a European war. The Bulgarian Government, first under Prince Alexander and afterwards under the direction of M. Stambolof, pursued systematically an anti-Russian policy, but the cabinet of St Petersburg confined itself officially to breaking off diplomatic relations and making diplomatic protests, and unofficially to giving tacit encouragement to revolutionary agitation.

In Asia, during the reign of Alexander III. the expansion of Russian domination made considerable progress. A few weeks after his accession he sanctioned the annexation of the territory of the Tekke Turkomans, which had been conquered by General Skobelef, and in 1884 he formally annexed the Merv oasis without military operations. He then allowed the military authorities to push forward in the direction of Afghanistan, until in March 1885 an engagement took place between Russian

and Afghan forces at Penjdeh. Thereupon the British Government, which had been for some time carrying on negotiations with the cabinet of St Petersburg for a delimitation of the Russo-Afghan frontier, intervened energetically and prepared for war; but a compromise was effected, and after more than two years of negotiation a delimitation convention was signed at St Petersburg on 20th July 1887. The forward movement of Russia was thus stopped in the direction of Herat, but it continued with great activity farther east in the region of the Pamirs, until another Anglo-Russian convention was signed in 1895. During the whole reign of Alexander III. the increase of territory in Central Asia is calculated by Russian authorities at 429,895 square kilometres.

Death of Alexander III.; accession of Nicholas II.

On 1st November 1894 Alexander III. died, and was succeeded by his son, Nicholas II., who, partly from similarity of character and partly from veneration for his father's memory, continued the existing lines of policy in home and foreign affairs. The expectation entertained in many quarters that great legislative changes would at once be made in a Liberal sense was not realized. When an influential deputation from the province of Tver, which had long enjoyed a reputation for Liberalism, ventured to hint in a loyal address that the time had come for changes in the existing autocratic régime, they received a reply which showed that the Emperor had no intention of making any such changes. Private suggestions in the same sense, offered directly and respectfully, were no better received, and no important changes were made in the legislation of the preceding reign. But a great alteration took place noiselessly in the manner of carrying out the laws and ministerial circulars. Though resembling his father in the main points of his character, the young Tsar was of a more humane disposition, and he was much less of a doctrinaire. With his father's aspiration of making Holy Russia a homogeneous empire he thoroughly sympathized in principle, but he disliked the systematic persecution of Jews, heretics, and schismatics to which it gave rise, and he let it be understood, without any formal order or proclamation, that the severe measures hitherto employed would not meet with his approval. The officials were not slow to take the hint, and their undue zeal at once disappeared. Nicholas II. showed, however, that his father's policy of Russification was neither to be reversed nor to be abandoned. When an influential deputation was sent from Finland to St Petersburg to represent to him respectfully that the officials were infringing the local rights and privileges solemnly accorded at the time of the annexation, it was refused an audience, and the leaders of the movement were informed indirectly that local interests must be subordinated to the general welfare of the empire. In accordance with this declaration, the policy of Russification in Finland was steadily maintained, and caused much disappointment, not only to the Finlanders, but also to the other nationalities who desired the preservation of their ancient rights.

In foreign affairs Nicholas II. likewise continued the policy of his predecessor, with certain modifications suggested by the change of circumstances. He strengthened the cordial understanding with France by a formal agreement, the terms of which were not divulged, but he never encouraged the French Government in any aggressive designs, and he maintained friendly relations with Germany. In the Balkan Peninsula a slight change of attitude took place. Alexander III., indignant at what he considered the ingratitude of the Slav nationalities, remained coldly aloof, as far as possible, from all intervention in their affairs. About three months after his death, M. de Giers, who thoroughly approved of this attitude, died (26th January 1895), and his successor, Prince Lobanof, minister of foreign affairs from 19th March 1895 to 30th August 1896, endeavoured to recover what he considered Russia's legitimate influence in the Slav world. For this purpose Russian diplomacy became more active in south-eastern Europe. The result was perceived first in Montenegro and Servia, and then in Bulgaria. Prince Ferdinand of Bulgaria had long been anxious to legalize his position by a reconciliation, and as soon as he got rid of M. Stambolof he made advances to the Russian Government. They were well received, and a reconciliation was effected on certain conditions, the first of which was that Prince Ferdinand's eldest son and heir should become a member of the Eastern Orthodox Church. As another means of opposing Western influence in south-eastern Europe, Prince Lobanof inclined to the policy of protecting rather than weakening the Ottoman empire. When the British Government seemed disposed to use coercive measures for the protection of the Armenians, he gave it clearly to be understood that any such proceeding would be opposed by Russia. After Prince Lobanof's death and the appointment of Count Muravieff as his successor in January 1897, this tendency of Russian policy became less marked. In April 1897, it is true, when the Greeks provoked a war with Turkey, they received no support from St Petersburg, but at the close of the war the Tsar showed himself more friendly to them; and afterwards, when it proved extremely difficult to find a suitable person as governor-general of Crete (see CRETE), he recommended the appointment of his cousin, Prince George of Greece—a selection which was pretty sure to accelerate the union of the island with the Hellenic kingdom. How far the recommendation was due to personal feeling, as opposed to political considerations, it is impossible to say.

In Asia, after the accession of Nicholas II. the expansion of Russia, following the line of least resistance and stimulated by the construction of the Siberian Railway, was effected at the expense of China. That she had already in 1895 marked out Manchuria as within her sphere of influence was proved by the fact that, at the close of the Chino-Japanese war of that year, she objected to all annexations by Japan in that quarter, and insisted on having the treaty of Shimonoseki modified accordingly. Subsequently, by means of railway construction, annexation of Port Arthur and the Liaotung peninsula, financial operations, and various conventions with the Chinese Government, she greatly tightened her hold on that portion of the Chinese empire (see CHINA and SIBERIA).

As a necessary basis for a strong foreign policy the army was systematically strengthened (see ARMIES: *Russia*). At one moment the schemes for military reorganization involved such an enormous expenditure that the Tsar conceived the idea of an agreement among the Great Powers to arrest the increase of national armaments. The idea was communicated to the Powers somewhat abruptly by Count Muravieff, Prince Lobanof's successor in the direction of foreign affairs, and an international conference was held at The Hague to discuss the subject; but it had very little practical result, and certainly did not attain the primary object in view (see PEACE CONFERENCE).

A sketch of the recent history of Russia, however brief, would be incomplete without some mention of the remarkable industrial progress made during the period under consideration. Protected by high tariffs and fostered by the introduction of foreign capital, Russian manufacturing

industry made enormous strides. By way of illustration a few figures may be cited. In the space of ten years (1887–97) the number of workers employed in the various branches of industrial enterprise rose from 1,318,048 to 2,098,262 (see under INDUSTRY). The consumption of cotton for spinning purposes, which was only 117 million kilograms in 1886, was 257 millions in 1898, and the number of spindles, according to the weekly journal *Russia* of 2nd August 1902, was estimated at that date at 6,970,000. Thanks chiefly to this growth of the cotton industry, the town of Łódz, which was little more than a big village in 1875, has now a population of over 300,000. The iron, steel, and petroleum industries have likewise made enormous progress. Between 1892 and 1900 the estimated value of metallic articles manufactured in the country rose from 142 millions to 276 millions of roubles. As is generally the case in such circumstances, protection led to temporary over-production, which brought about a financial and economic crisis; but if we may accept certain figures given by Mr Henry Norman in his *All the Russias* (London, 1902), the crisis could not have been very severe, for he states that "no fewer than 580 companies declared a dividend during the first nine months of 1901, their total nominal capital being £105,000,000, and the average dividend no less than 10·1 per cent." Much of this progress is due to the intelligence and energy of M. Witte, minister of finance. (D. M. W.)

Industrial progress.

RECENT LITERATURE.

The death of Nekrasoff in 1877 deprived Russia of her most eminent poet since the days of Pushkin and Lermontoff. During the last generation of the 19th century the Titans of her literature departed, and cannot be said to have left successors of equal merit. Dostoievski, Pisemsky, Tourguenieff, Goncharoff, Ostrovski, and Saltikoff followed each other to the grave in rapid succession. In 1895 Apukhtin, author of many graceful lyrics, died; in 1897 Apollon Maikoff, also a lyric poet of considerable power; and soon afterwards Polonski. These men were well known throughout Russia. A new school of poets has sprung up, consisting for the most part of the so-called decadents and symbolists. Among them may be mentioned A. Korinfski; Ivan Bunin, who shows much feeling for nature, and has published an excellent translation of Longfellow's *Hiawatha;* and Constantine Balmont. The last of these has given to the public several volumes of lyrics, many of which exhibit a graceful imagination and a capacity for skilfully reproducing various poetic moods. His command of all rhythms is astonishing, and owing to this gift, he has been a successful translator. Thus we may point to his excellent version of Shelley, besides translations from Edgar Allen Poe, Ibsen, and Calderon. We must also find room for the names of V. Briusoff and K. Sluchevski. Two female poets may be mentioned here, Mme Gippius-Merszhkovskaya and Mme Lokhvitskaya. It will be seen that the modern tendency in Russia is wholly to lyric poetry. These productions are often pervaded by an air of melancholy and *Weltschmerz.* The drama is not in a flourishing condition. Very little of merit has been produced since the great trilogy of Alexis Tolstoy dealing with the reign of Ivan the Terrible—full of picturesque horrors for the dramatist—and the *bourgeois* comedies of Ostrovski.

If we turn to history, in which the Russians have always shown considerable talent, we can cite some really good work. Of course we cannot here find room to discuss the publications of the various historical societies in the country, nor the valuable memoirs and other documents which are constantly appearing in the *Russian Antiquary* (*Russkaya Starina*); the *Historical Messenger* (*Istoricheski Viestnik*), and other journals, the name of which is legion. In 1897 Professor Bestuzheff-Riumin, of the University of St Petersburg, died. He had held his chair of history since 1865. His valuable *History of Russia* must now remain a torso only, the first volume and the first half of the second having alone appeared. Solovieff and Kostomaroff are dead. The famous school of Russian historians is thus almost extinct. But some excellent writers in this department have come to the front. Professor Miliukoff has published the first volume of his *Sketches of the History of Russian Culture* (*Ocherki po istorii russkoi kulturi*), which has been much read. Professor Bilbasoff is continuing his *History of Catherine II.* Some parts of this work appear to have been extensively mutilated by the censor. D. Evarnitski has added a third volume to his interesting work on the Zaporozhian Cossacks. The Russians have always enjoyed a considerable reputation as memoir-writers, and the *Recollections of Mme Smirnoff,* which first appeared in the *Northern Messenger* (*Sievernii Viestnik*) proved very interesting owing to her familiarity with court life and her intimacy with the leading men of the time who frequented her *salon.* Pushkin appears before us in the most minute details of his everyday life. The centenary of his birth (1899) was signalized by the publication of many interesting monographs on his strange career. The details furnished by his nephew, L. Pavlistcheff, were especially noteworthy. The second volume appeared of the classical *History of the Russian Church,* by E. Golubinski. A valuable contribution to early Russian history was furnished by the *Legal Antiquities* (*Youridicheskia Drevrosti*) of V. Serguievich, by which quite a new light has been thrown upon the Russian *sobor.* The well-known savant, Maxime Kovalevski, published the second volume of his *Economic Development of Europe to the Rise of Capitalism.* N. Rozhkoff wrote an important work entitled *Village Economy in Muscovy in the Sixteenth Century.* This book analyses the conditions under which economic production was developed in Old Russia. S. Platonoff published a *History of the Insurrections in Russia in the Sixteenth and Seventeenth Centuries.* He holds entirely new views on the *oprichina,* the famous bodyguard of Ivan the Terrible. Professor B. Kliuchevski, of the University of Moscow, published in 1883 a valuable book on the Russian Duma, as the Privy Council of the emperors was called, and in 1899 he issued his *Aids to Lectures on Russian History.* The study of the early institutions of their own country has always been actively pursued by Russian writers. They have less often devoted themselves to the political and social conditions of other countries, but an exception must be made in the case of the book by Professor Vinogradoff of Moscow, entitled *Investigations into the Social History of England in the Middle Ages* (1887). The learned author also prepared an edition of this work for the English public.

As yet no worthy successors have appeared of the great Russian novelists, Gogol, Tourguenieff, Dostoievski, and Tolstoy. We can hardly hope for such a constellation to appear again. Tolstoy, however, although advanced in years, and having almost deserted artistic production, shows no falling off in his latest work, *Resurrection,* a monument of his vigorous and deeply pathetic realism. In the region of fiction A. Chekhov of the younger school is especially remarkable. He is still in the prime of life, and has already shown great power in his short stories. Some of the tales of Gorki, Ertel, and Yasinski are also of great merit. The brilliant Garshin died insane in 1888.

(W. R. M.)

Rustchuk, or Rouchchouk, capital of a department in the principality of Bulgaria. It is situated on the south bank of the Danube, opposite the Rumanian town of Giurgevo, 139 miles north-west of Varna, on the railway line to Varna, and at the terminus of a line joining the central Sofia–Varna Railway near Tirnovo. Though no longer of strategic value, the town has acquired new importance owing to a great revival of commercial prosperity. The principal buildings are the custom-house, the municipal buildings, the theatre, the arsenal, and the barracks. The town possesses tobacco and cigarette factories, soap works, breweries, aerated water factories, dye-works, tanneries, saw-mills, brick and tile works, and a celebrated pottery. In 1897 the exports amounted to 20,225 tons, valued at £110,968, and in 1900 to 18,827 tons, valued at £110,470—the imports in the same years being 44,223 tons, valued at £616,573, and 20,285 tons, valued at only £240,844. Population (1900), 32,661.

Rustenburg. See Transvaal.

Rutherglen, a royal and parliamentary burgh (Kilmarnock group) of Lanarkshire, Scotland, on the Clyde, 2 miles south-east of Glasgow by rail. Dye-works, chemical works, cotton-weaving factories, chair, tube, and rope and twine works are among the industrial features. Population of royal burgh (1891), 13,361; (1901), 18,280.

Ruthin, a municipal borough and market-town, Denbighshire, North Wales, 21 miles west by south of Chester by rail, on the river Clwyd. It belongs to the Denbigh district of boroughs, which returns one member to Parliament. It is governed by a mayor, 4 aldermen, and 12 councillors. The grammar school has produced many distinguished men, and new buildings, in grounds 8 acres in extent, were opened in 1893, near the town. Scholarships connecting it to the universities have been established. Population of the municipal borough (1891), 2760; (1901), 2641.

Rutland, a north midland county of England, bounded on the N. by Leicester and Lincoln, on the S.E. by Northampton, and on the W. by Leicester.

Area and Population.—In 1891 the area of the ancient (geographical) county, with which that of the administrative county coincides, was 97,273 acres, and the population 20,659, of whom 10,323 were males and 10,336 females; and in 1901, 19,708. Thus there was a decrease of 951 between 1891 and 1901, or at the rate of 4·6 per cent., as compared with a decrease of 3·6 per cent. between 1881 and 1891, and of 2·9 per cent. between 1871 and 1881. In 1901 there were 0·20 persons to an acre, and 4·94 acres to a person. In the same year the area of the registration county was 108,700 acres, and the population 20,742.

The subjoined table gives particulars of the birth-rate, death-rate, and illegitimacy-rate, and the number of persons married per thousand inhabitants:—

	1871–80.	1881–90.	1889–98.	1899.
Birth-rate	30·7	27·6	24·0	22·9
Death-rate	18·5	16·3	14·9	14·2
Illegitimate-rate	53	52	49	49
Marriage-rate	12·9	11·2	13·3	12·3

In 1891 the county contained 113 persons of Scottish birth, 71 of Irish birth, and 71 foreigners. At the same date there were 22 blind persons, 6 deaf and dumb, and 21 insane.

Administration, &c.—The ancient county returns one member to the House of Commons, and contains neither municipal borough nor petty sessional division, but has one court of quarter sessions. The administrative county contains 58 entire civil parishes. The ancient county contains 41 entire ecclesiastical parishes and districts, and part of one other. It is entirely included within the diocese of Peterborough.

Education.—The number of elementary schools in the county on 31st August 1900 was 38, namely, 2 board schools and 36 voluntary schools, the latter including 35 National Church of England schools and 1 Roman Catholic school. The average attendance during the year amounted to 2803 out of 3349 on the register.

Agriculture.—Since 1885 there has been a decrease in the areas of the corn crops, and in fallow land, and an increase in the permanent pasture and meadow land. In 1900 a total of 78,188 acres were farmed by tenants and 8263 acres by the owners; the corresponding figures in 1889 were 74,811 and 12,113 acres, and in 1895, 74,159 and 13,165 acres respectively.

The following table shows the areas under the different kinds of crops at the periods named:—

Year.	Area in Cultivation.	Area under Corn Crops.	Area under Green Crops.	Area of Bare Fallow.	Area under Permanent Grass.
1885	86,477	22,820	7,520	1,768	47,816
1890	86,966	21,945	7,107	1,815	49,438
1895	87,324	20,541	7,612	1,422	51,850
1900	86,451	20,672	7,403	1,132	50,946

The next table shows the numbers of the live stock at the same periods:—

Year.	Cows and Heifers.	Other Cattle.	Total Cattle.	Horses.	Sheep.	Pigs.
1885	4,251	15,559	19,810	3,062	81,328	3,054
1890	4,026	15,815	19,841	3,097	86,382	2,989
1895	3,420	14,092	17,512	3,151	82,809	3,234
1900	3,455	15,663	19,118	3,232	84,794	2,277

Rutland produces a little limestone and sandstone (8030 tons in all in 1900).

See C. Wordsworth. *Rutland Words* (English Dialect Society). London, 1891.

Rutland, a city of Vermont, U.S.A., the capital of Rutland county. It is situated in 43° 37′ N., 72° 57′ W., in the valley of Otter Creek, and on the Bennington and Rutland, the Delaware and Hudson, and the Rutland railways, south-west of the centre of the state, at an altitude of 562 feet. It is divided into eleven wards, and has an excellent water-supply from East Creek by gravity. Rutland is best known for the quarries of fine marble in its vicinity. It contains large and varied manufactures, producing, among other things, machinery of various sorts and lumber products. Population (1890), 11,760; (1900), 11,499; showing a slight diminution in the preceding ten years. Of the population in 1900, 1533 were foreign-born.

Rutland, John James Robert Manners, 7th Duke of (1818–——), English statesman, was born at Belvoir Castle on 13th December 1818, being the younger son of the 5th duke of Rutland by Lady Elizabeth Howard, daughter of Byron's guardian, the 5th earl of Carlisle. Lord John Manners, as he then was, was educated at Eton and Trinity College, Cambridge. In 1841 he was returned for Newark in the Tory interest, along with W. E. Gladstone, and sat for that borough until 1847. Subsequently he sat for Colchester, 1850–57; for North Leicestershire, 1857–85; and for East Leicestershire from 1885 until in 1888 he took his seat in the House of Lords upon succeeding to the dukedom. Melbourne's Whig Government had been doomed for some time before it went out in June 1841. The Tories came in with a large majority under Peel, and among Manners's friends who were successful in the constituencies, besides Gladstone, were Smythe (afterwards 7th Viscount Strangford) at Canterbury, Baillie-Cochrane (afterwards 1st Lord Lamington) at Bridport, and Disraeli at Shrewsbury. Cherishing many of the ideas of the Cavaliers of the 17th century, and full of political and literary ardour, he was soon prominent in the social group which revolved round Lady Blessington. He seems to have inherited the poetical ambition of his maternal grandfather, and in 1841 he committed some of his Loyalist and other fancies to a volume called *England's Trust, and other Poems*, which he dedicated to his friend Smythe, in which occurred the familiar line about "laws and learning" and "our old nobility." Before the end of

this year Manners had definitely associated himself with the "Young England" party, under the leadership of Disraeli. The Young England party sought to extinguish the predominance of the middle-class bourgeoisie, and to recreate the political prestige of the aristocracy by resolutely proving its capacity to ameliorate the social, intellectual, and material condition of the peasantry and the labouring classes. At the same time they looked for a regeneration of the Church, and the rescue of both the Church and Ireland from the trammels inherited from the Whig predominance during the 18th century. Outside as well as inside Parliament Manners strenuously advocated these principles. He made an extensive tour of inspection in the industrial parts of northern England, in the course of which he and his friend Smythe expounded their views with a brilliancy which frequently extorted compliments from the leaders of the Manchester school. In 1843 he supported Lord Grey's motion for an inquiry into the condition of England, the serious disaffection of the working classes of the north being a subject to which he was constantly drawing the attention of Parliament. Among other measures that he urged were the disestablishment of the Irish Church, the modification of the Mortmain Acts, and the resumption of regular diplomatic relations with the Vatican. In the same year he issued in pamphlet form a strong *Plea for National Holydays*. In 1844 he vigorously supported the Ten-hours Bill, which, though strongly opposed by Bright, Cobden, and other members of the Manchester school, was ultimately passed in May 1847. In October during this year he took part in and spoke at the brilliant *soirée* held at the Manchester Athenæum under the presidency of Disraeli. A few days later he and his friends attended a festival at Bingley, in Yorkshire, to celebrate the allotment of land for gardens to working men, a step which, through the agency of his father, he had done a great deal to further. About the same time Smythe dedicated to him his *Historic Fancies* as to "the Sir Philip Sidney of our generation." Manners figured as Lord Henry Sydney in Disraeli's *Coningsby*, and not a few of his ideas are represented as those of Egremont in *Sybil* and Waldershare in *Endymion*. But the disruption of the Young England party was already impending. Lord John's support of Peel's decision to increase the Maynooth grant in 1845 led to a difference with Disraeli. Divergences of opinion with regard to Newman's secession from the English Church produced further defections in the ranks, and the rupture was completed by Smythe acquiescing in Peel's conversion to Free Trade. Lord John produced another volume of verse, known as *English Ballads*, chiefly patriotic and historical, in 1850. In the same year, as the fruit of a cruise in Scottish waters, he wrote the letterpress for a sumptuous atlas of coloured views by J. C. Schetky; and he published several pamphlets, one on the *Church of England in the Colonies* in 1851. During the three short administrations of Lord Derby (1851, 1858, and 1866) he sat in the cabinet as first commissioner of the Office of Works. On the return of the Conservatives to power in 1874 he became postmaster-general in Disraeli's administration, and was made G.C.B. on his retirement in 1880. He was again postmaster-general, in Lord Salisbury's administration 1885–86, and was head of the department when sixpenny telegrams were introduced. Finally, in the Conservative Government of 1886–92 he was chancellor of the duchy of Lancaster. He succeeded to the dukedom in March 1888, upon the death of his elder brother, Charles Cecil John Manners (the Marquis of Beaumanoir of *Coningsby*), 6th duke of Rutland, an unflinching Protectionist and supporter of Lord George Bentinck. He was made K.G. in 1891.

Ruvo, a town and episcopal see of Italy, Apulia, province of Bari, 21 miles west of Bari, with a cathedral, technical school, and a collection of antique vases (others at Naples) found in the place. It has olive-oil presses. Population (1900), about 17,000.

Ruwenzori, or Runsoro, a great mountain range in Central Africa, lying between the equator and 1° N., and intersected at about its centre by 30° E. It possesses probably the most extensive snow-fields which exist in the whole of Africa, but being still imperfectly known, its greatest height cannot be estimated with any accuracy. The range forms a great volcanic mass, of which the core seems to be composed of coarse-grained granite rocks, flanked by schists, &c., tilted at a high angle. Its formation was evidently connected with that of the great central rift valley, towards which it falls steeply on the west, while at its southern end it is abruptly terminated by the widening of the valley where occupied by the Albert Edward Lake. Eastward it falls somewhat less steeply to the high plateau of western Uganda, while to the north it appears to sink gradually to the plateau forming the eastern wall of the Albert Nyanza. The general axis runs from south-south-west to north-north-east, the highest summits lying near the western edge, while the eastern half seems to consist of parallel ridges of less elevation, giving a breadth to the range where widest of some 22 miles. The sides of the range are deeply furrowed by the valleys of streams, some of which descend from the glaciers of the upper region. The highest peaks, many of which rise above the line of perpetual snow, occur between 0° 25′ N. and 0° 35′, mostly near the meridian of 30° E. They seem to form three or more groups, separated by deep clefts which admit of a passage across the range at an altitude of some 12,000 feet. Of the central group, the principal peak appears to be that known as Ngomwimbi (0° 21′ N.), from the neighbourhood of which several large glaciers descend to the east. A little to the north is the peak of Kanyangugwe, while other snow peaks extend as far north as 0° 32′ N., where is the lofty Saddle Mountain. The altitude assigned to these peaks varies between 16,000 and 20,000 feet. The lower estimates have generally been made by travellers in the immediate neighbourhood of the peaks, where the highest summits may have been hidden from view, while the higher figures have been deduced from a general view at a distance, which shows the great extent of the snow-fields.

The upper parts of the range are almost constantly veiled in cloud, which, however, gradually rises during the day, sometimes leaving the summits clear at about 5.30 P.M. As a result, perpetual moisture prevails above 7000 feet, and there is a very heavy rainfall, especially in the districts on the east, a number of rushing streams descending to Lake Ruisamba (an arm of the Albert Edward Lake) on the east and the Semliki valley on the west, thus playing an important part in filling the source-reservoirs of the Nile. As on other high mountains of equatorial Africa, there is a regular succession of zones of vegetation, the belts being defined by Mr Scott-Elliot as follows:—

- 3850–5350 feet: Bananas and tall grasses.
- 6700 feet: limit of settlements, with Colocasia and beans.
- Up to 8530 feet: forests of deciduous trees, with Erica and bamboo.
- Up to 11,800 feet: Erica forests, bogs, and Vaccineum.
- Up to snow-line (about 13,000 feet): bushes, tree ferns, grass, mosses, lichens.

First seen from the Albert Lake by Gessi and Mason,

the true character and extent of the range were first brought to light by Stanley in 1888–89, when Lieutenant Stairs ascended (in 0° 30′ N.) to a height of 10,677 feet. The northern and eastern slopes were first traversed by Lugard in 1891, while ascents to the snows, or near them, were afterwards made by Stuhlmann (1891), Scott-Elliot (1894; 12,640 feet), Moore (1900), Johnston (1900), and Wylde (1901), the last-named having possibly reached a higher point (15,000 feet by aneroid) than had been before attained.

Ryazan, a government of Middle Russia, lying to the south-east of the government of Moscow, with an area of 16,255 square miles. Its geology has now been carefully explored, and the physical description given in the ninth edition may now be supplemented by the statement that the province is widely covered with the so-called Volga deposits, intermediate between Jurassic and Chalk, and by Chalk in the north-east. Quaternary deposits, represented by the Glacial boulder clay, also cover extensive areas. The domiciled population numbered 1,713,581 in 1882 and 1,827,539 in 1897, when there were 962,085 women in the province and the total urban population was only 166,122. More than half of the land (52 per cent.) is owned by the village communities, 40 per cent. by private owners, 5 per cent. by the Crown, and 2 per cent. by various institutions. During the last thirty years of the 19th century the nobles sold 36 per cent. (1,261,000 acres) of their lands, mainly to merchants and peasants; the latter cultivate two-thirds of the total cultivated area. In 1900 there were 3,045,300 acres under cereal crops, and the average yield per annum in 1895–99 was: wheat 77,000 cwt., rye 10,044,000, oats 4,971,000—all cereal crops 17,037,000 cwt.; potatoes also yielded 11,484,000 cwt. But the crops are still insufficient for the needs of the inhabitants. Tobacco, hops, vegetables and fruit, however, are grown for export. The live stock included in 1896, 303,583 horses, 323,600 horned cattle, and 806,800 sheep, thus showing a considerable increase on the number of head in the province in 1882. Bee-keeping is also developing and manufactures increasing, there being in 1897, 4008 factories, which gave occupation to nearly 25,000 workers and showed a yearly output of £2,212,000. These factories are chiefly cotton mills, flour mills, machine works, tanneries, soap works, boot factories, match factories, and chemical works. Coal is extracted to the amount of about 77,000 tons per annum. The province is divided into twelve districts, the chief towns of which are Ryazan (see below), Dankov (9097), Egorievsk (19,241), Kasimoff (13,545), Mikhailoff (9149), Pronsk (7827), Ranenburg (15,347), Ryazhsk (12,993), Sapozhok (8544), Skopin (14,737), Spassk (4760), and Zaraisk (8078). Small industries are carried on in the villages, especially in the northern part of the government, which belongs, properly speaking, to the Vladimir industrial region. Domestic trades, such as lace-making (supported by two schools) and embroidering on leather, give occupation to 40,000 women. Trade, especially in corn and manufactured goods, is brisk, and has been stimulated by the opening of coal mines, of which the Chulkovo mine, in the district of Skopin, is one of the largest. A number of secondary railways have been built in the government, and steamers now ply on the Oka river from Nijni-Novgorod to Ryazan. Considerable efforts have been made by the local governing bodies to increase the number of schools, of which there were 964 in 1897. Most interesting archæological finds have been made in the government, which have been placed in the new museum at Ryazan.

Ryazan, the capital of the above government, 119 miles by rail south-east of Moscow, 1 mile above the junction of the Trubezh with the Oka. Owing to its situation on the great railway connecting Moscow with South-East Russia, and on a navigable river, Ryazan occupies a very advantageous position both as a centre of trade and of railway traffic. Its twenty factories (works for the manufacture of machinery and wax candles, and distilleries) give occupation to only a few hundred workers; but its trade in grain and live stock is growing, as also is its population, which was 30,325 in 1883 and 44,552 in 1897. In 1896 there were 31 schools, with 3860 pupils; and there is a good historical museum and library, with an archæological section, and various philanthropic institutions.

Ryazhsk, a district town of Russia, in the government and 70 miles south of the town of Ryazan. It is one of the chief railway junctions of Russia, where meet the lines from Moscow to South Russia and the Caucasus, and the railway from Poland to Samara and Siberia. Consequently it has become a very important centre of trade for all the grain-growing regions of Russia, and is a wealthy place. Its population in 1897 was 12,993.

Rybinsk, a district town of Russia, in the government of Yaroslavl. It stands on the Volga, 186 miles by rail east of Bologoye, a junction on the St Petersburg–Moscow Railway. It is one of the most important towns of Central Russia, and has an exchange, a theatre, gymnasia for boys and girls, technical and navigation schools, and a great number of primary schools; also numerous flour-mills and breweries. It derives its importance mainly from being a centre for navigation on the upper Volga, and for trade in corn. Every year from 3800 to 4500 vessels enter (of which 1823 were steamers in 1898), while as many as 6300 clear. The aggregate tonnage of goods passing through the port annually is 1,327,310 entered and 1,124,200 cleared—one-third by rail and two-thirds by the way of the canals connecting the Volga with St Petersburg. From 300,000 to 400,000 tons of wheat and rye and from 290,000 to 340,000 tons of oats pass through the port every year. The permanent population, which was 18,900 in 1883 and 25,223 in 1897, is increased in the summer by nearly 100,000 workers from different parts of Russia. Throughout the summer, indeed, Rybinsk might almost be said to be one huge fair for trade in agricultural produce.

Rydberg, Abraham Viktor (1828–1895), Swedish author and publicist, was born in Jönköping on 18th December 1828. He showed an inclination to literature from his early boyhood. He was educated at the high school of Växiö, and passed on to the University of Lund in 1851. While at school he was publishing verse and prose in the periodicals; some of these early miscellanies he collected in 1894, in the volumes called *Varia.* As a student he turned to more precise labours, and devoted himself to science. He had almost determined to adopt the profession of an engineer, when he was offered in 1855 a post on the staff of one of the largest Swedish newspapers. This caused his thoughts to return to imaginative literature, and it was in

the feuilleton of this journal (the *Göteborgs Handels-och sjöfartstidning*) that Viktor Rydberg's romances successively appeared; he was editorially connected with it until 1876. *The Freebooter on the Baltic* (1857) and *The Last of the Athenians* (1859) gave Rydberg a place in the front rank of contemporary novelists. It was a surprise to his admirers to see him presently turn to theology, but with *The Bible's Teaching about Christ* (1862), in which the aspects of modern Biblical criticism were first placed before Swedish readers, he enjoyed a vast success. He followed this up by a number of contributions to the popular philosophy of religion, all inspired by the same reverent and yet searching spirit of inquiry. The modernity of his views led to his being opposed by the orthodox clergy, but by the wider public he was greatly esteemed. Nevertheless, it is said that it was his religious criticism which so long excluded him from the Swedish Academy, since he was not elected until 1877, when he had long been the first living author of Sweden. A very engaging work of Rydberg's is his *Roman Days*, a series of archæological essays on Italy (1876). He collected his carefully polished poems in 1882; his admirable version of *Faust* dates from 1876. In 1884 he was appointed professor of ecclesiastical history at Stockholm. He died, after a short illness, on 1st September 1895. In Viktor Rydberg Sweden possessed a writer of the first order, who carried on the tradition of Boström and Geijer in philosophy and history, and possessed in addition a glow of imagination and a marvellous charm of style. He was an idealist of the old romantic type which Sweden had known for three-quarters of a century; he was the last of that race, and perhaps, as a mere writer, the greatest. In personal character Rydberg was extremely like his writings—stately, ardent, and ceremonious, with a fund of amiability which made him universally beloved. It may make him more intelligible to the English reader to say that both in temperament and in the character of his writings Rydberg possessed a curious similarity to Charles Kingsley. His premature death was the subject of national mourning, and had even a historical significance, for with him the old romantic influence in Swedish literature ceased to be paramount. (E. G.)

Ryde, a municipal borough and watering-place, Hampshire, England, in the Isle of Wight, 5 miles south by west of Portsmouth and 12 miles by rail from Cowes. The pier has been entirely reconstructed by a combination of railway companies, so that passengers may step direct from train to boat. This involved a pier half a mile long by the side of the original pier, and also a tunnel under part of the town. Population of municipal borough (1891), 10,952; (1901), 11,042.

Rye, a municipal borough, cinque port, and market town, Sussex, England, in the Rye parliamentary division of the county, on the river Rother, 63 miles south-south-east of London by rail. A steam tram-line from Rye to Camber, which has golf-links, was opened in 1895. Almshouses in honour of Queen Victoria's Diamond Jubilee were erected on the green by public subscription in 1897. Population of municipal borough (1891), 3871; (1901), 3900.

Ryezhitsa, a district town of Russia, in the government and 199 miles by rail north-west of the town of Vitebsk, on the railway from St Petersburg to Warsaw. It is an old town, founded in 1285, and temporarily annexed to Poland in 1561, but retaken by the Russians in 1577, and finally annexed to Russia in 1773. It has a very picturesque old castle. In 1897 its population was 10,681.

Rylsk, a district town of Russia, in the government and 83 miles west-south-west of the town of Kursk. It is connected by a branch line with the Kursk-to-Kiev Railway. In the way of industrial establishments it has only oil works, but its merchants carry on an active trade in corn, hemp, and scythes imported from Austria. It has gymnasia for both boys and girls. In 1897 its population was 11,415. It is a very ancient town, founded in the 9th century, and is frequently mentioned in the annals from 1152 onwards. It derived importance from being an important post on the Russian frontier down to the 18th century; its cathedral was built in the 15th century.

Rzeszów, the chief town of a government district of the same name in Galicia, Austria. It is situated on the Wislok, a tributary of the San, and is a station on the Cracow–Lemberg Railway. It is the headquarters of an infantry and a cavalry brigade, has the most important horse fairs of Galicia, and manufactures cloth and linen goods, goldsmiths' work, and tobacco pipes. It contains an old château of the princely family of Lubomirski, a Polish gymnasium, and a training college. Population (1890), 11,953; (1900), 14,714 (including garrison of 2296 men), almost exclusively Polish-speaking.

Saale, a river of Germany, originating between Bayreuth and Hof in the north-east of Bavaria, springing out of the Fichtelgebirge at an altitude of 2390 feet. It pursues a winding course in a northerly direction, flowing past Hof, Saalfeld, Rudolstadt, Jena, Naumburg, Weissenfels, Merseburg, Halle, Bernburg, and Kalbe, and joins the Elbe (from the left) just above Barby, after traversing a distance of 226 miles. It is navigable from Naumburg, 100 miles, with the help of sluices, and is connected with the Elster near Leipzig by canal. The soil of the lower part of its valley is of exceptional fertility, and produces, amongst other crops, large supplies of sugar beetroot. Among its affluents are the Elster, Regnitz, and Orla (right bank), and the Ilm, Unstrut, Salza, Wipper, and Bode (left). Its upper course is rapid. Its valley (down to Merseburg) is picturesque, and even romantic, because of the many castles which crown the enclosing heights. It is sometimes called the Thuringian or Saxon Saale, to distinguish it from another Saale (70 miles), a right-hand tributary of the Main, in the Bavarian district of Lower Franconia.

Saar, a river of Alsace-Lorraine and Rhenish Prussia, rising on the north-east shoulder of the Vosges Mountains, under the foot of Mount Donon. It flows northwards past Saarburg, Saar Union, Saargemünd, Saarbrücken, then north-north-westwards past Saarlouis, and joins the Mosel (Moselle) from the right a few miles above Treves. Its total length is 153 miles, of which 75 (namely, from Saargemünd) are navigable. Its valley is broad and shallow. By means of the Saar canal (40 miles long), made by the French Government in 1862, it is connected with the Rhine–Marne canal.

Saarbrücken, or SANKT JOHANN-SAARBRÜCKEN, a town of Prussia, in the Rhine province, 49 miles by rail east-north-east of Metz, on the left bank of the Saar, the

sister town of Sankt Johann being immediately opposite. The Saar coal-fields are estimated to yield 9 to 10 million tons annually, and give employment to nearly 42,000 men. The two towns together possess important iron and glass works, and manufactures of machinery, chemicals, tobacco, &c., and a large trade in coal. In Saarbrucken there are a mining academy and a monument to Bismarck (1899). The town-hall has been adorned with paintings by Anton von Werner, illustrating the battles of the neighbouring Spicheren Heights in 1870. Population of Saarbrucken (1885), 10,453; (1900), 23,242; of Sankt Johann (1885), 13,598; (1900), 21,257.

Saarburg, a town of Germany, Alsace-Lorraine, district Lorraine, on the Saar, 44 miles west-north-west of Strasburg. It is still surrounded with walls. Its manufactures include watch-springs, gloves, lace, and beer. It is identified with the *Pons Saravi* of the Romans. Population (1900), 9178.

Saarlouis, a fortified town of Prussia, in Rhine province, 40 miles by rail south of Treves, on the left bank of the Saar. Its fortifications were laid out by Vauban in 1680–85. There are coal-mines, and considerable manufacture of porcelain, glass, and leather. It was the birthplace of Marshal Ney (1769–1815). Population (1900), 7864.

Saaz (Czech, *Žatec*), a manufacturing and commercial town in the north of Bohemia, on the river Eger, 30 miles east by north of Carlsbad. Population (1890), 13,234; (1900), 16,168, mainly German and Catholic. Together with the important export of hops—of which business it is the chief centre—there is a trade in vegetables, machinery, brewing and corn-milling, &c. The town was provided with a new water-supply in 1894. It has latterly become prominent for its strong German-Nationalist sentiment and its efforts to exclude the Czech element, which forms, however, only about 5 per cent. of the population.

Sabadell, a town of Spain, province of Barcelona, on the river Ripoll, with a station on the Barcelona–Saragossa Railway. Population (1887), 19,645; (1897), 23,044. The industries comprise cloths and linen, which give employment to 11,000 workmen in a hundred factories, producing goods valued at half a million sterling annually. There are also manufactures of alcohol, paper, and flour, besides foundries and saw-mills. The town has handsome modern public buildings, including the town-hall, schools for primary and higher education, hospitals, and casinos. The churches are not interesting. Sabadell is said to be the Roman *Sebendunum*, but in Spanish annals it is not noticed until the 13th century.

Sables d'Olonne, Les, chief town of arrondissement, department of Vendée, France, 21 miles west-south-west of Roche-sur-Yon by rail. There are a municipal school of maritime fisheries and a maritime laboratory. In 1900, 372 boats manned by 1788 men were engaged in the fisheries, the total annual value of which is estimated at about £95,000, the average annual product of the sardine fishery alone amounting to over 160,000 cwts., while the tunny fishery is also important. More than 7 million oysters are annually exported. The port is now accessible for vessels of 800 to 2000 tons. The total movement of shipping, including coasting trade, amounted in 1900 to 164,392 tons. Foreign exports are unimportant; the principal imports are coal, wood, petroleum, and phosphates. Population (1891), 9905; (1901), 11,870.

Sachs, Julius von (1832–1897), German botanist, was born at Breslau on 2nd October 1832. At an early age he showed a taste for natural history, and on leaving school he became, in 1851, private assistant to the physiologist Purkinje at Prague. In 1856 he graduated as doctor of philosophy, and then adopted a botanical career, establishing himself as *privat-docent* for plant physiology in the University of Prague. In 1859 he was appointed physiological assistant to the Agricultural Academy of Tharandt in Saxony; and in 1861 he was called to be director of the Polytechnic at Chemnitz, but was almost immediately transferred to the Agricultural Academy at Poppelsdorf, near Bonn, where he remained until 1867, when he was nominated professor of botany in the University of Freiburg-im-Breisgau. In 1868 he accepted the chair of botany in the University of Würzburg, which he continued to occupy (in spite of calls to all the important German universities) until his death on 29th May 1897.

Sachs achieved distinction as an investigator, a writer, and a teacher; his name will ever be especially associated with the great development of plant physiology which marked the latter half of the 19th century, though there is scarcely a branch of botany to which he has not materially contributed. His earlier papers, scattered through the volumes of botanical journals and of the publications of learned societies (a collected edition was published in 1892–93), are of great and varied interest. Prominent among them is the series of "Keimungsgeschichten," which laid the foundation of our knowledge of micro-chemical methods, as also of the morphological and physiological details of germination. Then there is his resuscitation of the method of "water-culture," and the application of it to the investigation of the problems of nutrition; and further, his discovery that the starch-grains to be found in chloroplastids are the first visible product of their assimilatory activity. His later papers were almost exclusively published in the three volumes of the *Arbeiten des botanischen Instituts in Würzburg*, 1871–88. Among these are his investigation of the periodicity of growth in length, in connexion with which he devised the self-registering auxanometer, by which he established the retarding influence of the highly refrangible rays of the spectrum on the rate of growth; his researches on heliotropism and geotropism, in which he introduced the "clinostat"; his work on the structure and the arrangement of cells in growing-points; the elaborate experimental evidence upon which he based his "imbibition-theory" of the transpiration-current; his exhaustive study of the assimilatory activity of the green leaf; and other papers of interest. Sachs' first published volume was the *Handbuch der Experimental-Physiologie der Pflanzen*, 1865 (French edition, 1868), which gives an admirable account of the state of knowledge in certain departments of the subject, and includes a great deal of original information. This was followed in 1868 by the first edition of his famous *Lehrbuch der Botanik*, by far the best book of its kind. It is a comprehensive work, giving an able summary of the botanical science of the period, enriched with the results of many original investigations. The fourth and last German edition was published in 1874, and two English editions were issued by the Oxford Press in 1875 and 1882 respectively. The *Lehrbuch* was eventually superseded by the *Vorlesungen über Pflanzen-physiologie* (1st ed., 1882; 2nd ed., 1887; Eng. ed., Oxford, 1887), a work more limited in scope, but yet covering more ground than its title would imply: though it is a remarkable book, it has not gained the general recognition accorded to the *Lehrbuch*. Finally, there is the *Geschichte der Botanik* (1875), a brilliant and learned account of the development of the various branches of botanical science from the middle of the 16th century up to 1860, of which an English edition was published in 1890 by the

Oxford Press. As a teacher Sachs exerted great influence, for his vigorous personality and his ready and lucid utterance enabled him not only to instruct, but to fire his students with something of his own enthusiasm.

A full account of Sachs' life and work has been given by Prof. Goebel, formerly his assistant, in *Flora*, 1897, of which an English translation appeared in *Science Progress* for 1898. There is also an obituary notice of him in the *Proc. Roy. Soc.* vol. lxii.

(S. H. V*.)

Saco, a city of York county, Maine, U.S.A., on the left bank of the Saco river, just above its mouth, opposite Biddeford, and on two lines of the Boston and Maine Railroad, in the south-western part of the state. It has fine water-power derived from a fall of 40 feet in the river, which is utilized in the manufacture of cotton goods, machinery, boots and shoes, &c. Near the city is Old Orchard Beach, a popular seaside resort. Population (1890), 6075; (1900), 6122, of whom 903 were foreign-born.

Sacramentary of Serapion, The, contained in a collection of Egyptian documents in an 11th-century MS. at the Laura on Mount Athos, was published by A. Dmitrijewskij in 1894, but attracted little attention until independently discovered and published by G. Wobbermin in 1899. It is a celebrant's book, containing thirty prayers belonging to the mass (19–30, 1–6), baptism (7–11, 15, 16), ordination (12–14), benediction of oil, bread, and water (17), and burial (18), omitting the fixed structural formulæ of the rites, the parts of the other ministers, and almost all rubrication, except what is implied in the titles of the prayers. The name of Serapion, bishop of Thmuis, St Athanasius's friend, is prefixed to the anaphora of the mass (1) and to the group 15–18: but whether this indicates authorship is doubtful; for whereas the whole collection is bound together by certain marks of vocabulary, style, and thought, 15–18 have characteristics of their own not shared by the anaphora, while no part of the collection shows special affinities with the current works of Serapion. But his name is at least a symbol of probable date and provenance: the theology, which is orthodox so far as it goes, but "conservative," and perhaps glancing at Arianism, shows no sign that the Macedonian question has arisen; the doxologies, of a type abandoned by the orthodox, and by *c.* 370 treated by St Didymus Al. as heretical; the apparent presupposition that the population is mainly pagan (1, 20); the exclusive appropriation of the mass to Sunday (19; cp. Ath. *ap. c. Ar.* 11), whereas the liturgical observance of Saturday prevailed in Egypt by *c.* 380; the terms in which monasticism is referred to—together point to *c.* 350: the occurrence of official interpreters (25) points to a bilingual Church, *i.e.*, Syria or Egypt; and certain theological phrases (*ἀγένητος, ἐπιδημία, μόνη καθολικὴ ἐκκλησία*) characteristic of the old Egyptian creed, and the liturgical characteristics, indicate Egypt; while the petition for rains (23), without reference to the Nile-rising, points to the Delta as distinguished from Upper Egypt. The book is important, therefore, as the earliest liturgical collection on so large a scale, and as belonging to Egypt, where evidence for 4th-century ritual is scanty as compared with Syria.

The rites form a link between those of the *Egyptian Church Order* (a 3rd- or early 4th-century development of the Hippolytean Canons, which are perhaps Egyptian of *c.* 260) and later Egyptian rites—marking the stage of development reached in Egypt by *c.* 350, while exhibiting characteristics of their own. I. The Mass has the Egyptian notes—a prayer before the lections, elsewhere unknown in the East; an exceptionally weighty body of intercessions after the catechumens' dismissal, followed by a penitential act, probably identical with the *ἐξομολόγησις* of *Can. Hippol.* 2, which disappeared in later rites; a setting of the Sanctus found in several Egyptian anaphoras; the close connexion of the commemorations of the offerers and of the dead; and the form of the conclusion of the anaphora. The structure of the communion—with a prayer before and prayers of thanksgiving and blessing after—shows that Egypt had already developed the common type, otherwise first evidenced in Syria, *c.* 375 (*Ap. Const.* viii. 13). Among the special characteristics of Serapion are the simplicity of the Sanctus, and of the Institution, which lacks the dramatic additions already found in *Ap. Const.*; the interpolation of a passage containing a quotation from *Didache* 9 between the institutions of the bread and of the chalice; the form of the *ἀνάμνησις*; and the invocation of the Word, not of the Holy Ghost, to effect consecration. That the Lord's Prayer before communion is not referred to may be only because it is a fixed formula belonging to the structure of the rite. II. The Order of Baptism has a form for the consecration of the water, and a preliminary prayer for the candidates, perhaps alluding to their exorcism; a prayer for steadfastness following the renunciation and the confession of faith; the form of anointing with oil; appropriate prayers preceding and following the act of baptism; and the prayer of confirmation with imposition of the hand, chrism, and crossing. All this corresponds to and fills up the outline of the *Church Order* and allusions in 4th-century writers, and is in line with later Egyptian rites. III. Forms of Ordination are provided only for deacons, presbyters, and bishops, the orders of divine institution (12). They are concise, but of the normal type. That for deacons (12) commemorates St Stephen, invokes the Holy Ghost, and prays for the gifts qualifying for the diaconate. That for presbyters (13) recalls the Mosaic LXX, invokes the Holy Ghost, and asks for the gifts qualifying for administration, teaching, and the ministry of reconciliation. That for bishops (14) appeals to the mission of our Lord, the election of the apostles, and the apostolic succession, and asks for the "Divine Spirit" conferred on prophets and patriarchs, that the subject may "feed the flock" "unblameably and without offence continue in" his office. The minor orders, interpreters, readers, and subdeacons (25) are evidently, as elsewhere in the middle of the 4th century, appointed without sacramental ordination. IV. The use of exorcised or blessed oil, water, and bread is fully illustrated by the lives of the fathers of the desert (cp. the Gnostic use, Clem. Al. *Excerpta* 82). Serapion has a form of benediction of oil and water (5) offered in the mass (like *Can. Hippol.* and *Ch. Ord.* for oil), probably for the use of individual offerers. A longer form for all three matters (17) perhaps has in view the general needs of the Church in the visitation of the sick. The occurrence in both prayers of "the Name" and the commemoration of the Passion, Resurrection, &c., corresponds with early allusions, in Origen and elsewhere, to the usual form of exorcism. V. For burial of the dead Serapion gives a prayer for the departed and the survivors (18). But the funeral procession is alluded to (*ἐκκομιζομένου*), and in the mass (1) the particular commemoration of departed persons is provided for. Hence we have the elements of the 4th-century funeral, as we know it in Egypt and elsewhere: a preliminary office (of readings and psalms) to which the prayer belongs, the procession (with psalmody) to the cemetery, the burial, and the mass *pro domitione*.

Sacramento, a city of California, U.S.A., capital of the state and of Sacramento county, on the river Sacramento, at the mouth of the river American, on the eastern side of Sacramento valley, at an altitude of 30 feet. It has a level site and its street plan is regular, with broad streets, few of which are paved. The north and south streets are numbered, the east and west designated by letters. Its water-supply is derived from the river. Besides the state Capitol, the notable buildings are the Roman Catholic cathedral, agricultural hall, the court house, the city hall, and the Croker art gallery. The city is practically at the head of navigation on the river, and has daily steamer connexion with San Francisco. It is on the direct line east of the Southern Pacific Railroad, the starting-point of the line to Portland, Oregon, and the terminus of several smaller branches, all of which give it a large trade. In 1900 it contained 279 manufacturing establishments, with a total invested capital of $7,492,313; they employed 4393 hands, and the product was valued at $11,785,621. The principal product was flour, with a value of $1,128,536. In 1898 the assessed valuation of real and personal property was $15,654,625; the net debt of the city was but $164,000; and the rate of taxation was $35·40 per $1000. Population (1890), 26,386; (1900), 29,282, of whom 6723 were foreign-born and 1806 were coloured (negroes, Chinese, &c.).

Sado, an island belonging to Japan, lying 32 miles westward of Niigata, on 38° N. and a little to the east of 138° E. It has a circumference of 130 miles, an area of 336 square miles, and a population of 112,738. The port is Ebisu-minato, on the west coast; and at a distance of 16½ miles, near the east coast, is the town of Aikawa, having in its vicinity gold and silver mines, for which Sado is famous, and which have been worked from very early times. The loftiest peak is that of Kimpokusan (3815 feet), to the north of Aikawa.

Sadowa (Czech, *Sádová*), a village in north-east Bohemia, Austria, near Königgrätz. Sadowa, with the small adjoining wood, was one of the principal and most hotly-contested Prussian positions in the decisive battle of 3rd July 1866, which is still frequently spoken of as the battle of Sadowa. In 1890 it had 205, and in 1900 183 Czech inhabitants, chiefly engaged in agriculture, sugar-refining, and brewing.

Safes and Vaults.—From the earliest times strong receptacles for valuables have been constructed, and as the ingenuity of robbers successively overcame them, improvements have followed. As the name indicates, the earliest vaults were of masonry; the thickness of the walls was relied upon for security, and the entrance was closed by a heavy wooden door, secured by some form of lock. In the ancient days the bolts were of wood, and the locking mechanism of the Egyptian pin type. Later the doors were made of metal, and the iron bolts were often secured by padlocks, the lock protection probably being quite as strong as the door it fastened. The modern safe is doubtless an evolution from the old strong box, and to-day many so-called burglar-proof safes are nothing more than iron chests secured by key locks, and offering no defence whatever against the attacks of burglars. At the present time safes are divided into two distinct classes: fire-proof safes and burglar-proof safes, although occasionally the two constructions are combined. In each case the term is of relative meaning, no safe being either fire- or burglar-proof if unlimited time be given. What is aimed at is to provide protection which shall be efficient during the duration of any probable conflagration, and to prevent forcible entry within the limited period in which the safe is left unguarded.

Fire-proof safes.

The usual method of fire-proofing a safe is to make the walls of sufficient thickness to contain a filling of some material which shall be at the same time a good non-conductor of heat and also contain a large proportion of combined water. Such fillings are found in plaster of Paris, alum, &c. The chests themselves, being made of sheet iron or steel, offer some resistance to ordinary tools, but may readily be penetrated by drills or cold chisels used by experienced hands; but when properly fitted, such safes will resist the action of the temperatures to which they are exposed in ordinary conflagrations, and will effectively protect books, papers, and valuables against fire. Such safes are often fitted with dial locks, the construction of which will be referred to later. Burglar-proof safes are ordinarily not intended to resist fire, but are supposed to be placed either in fire-proof buildings or in masonry vaults where they will be sufficiently protected against heat in case of fire, to prevent danger of injury to the contents from this cause. Since the attacks of burglars may be upon the body of the safe, upon the door, or upon the locking mechanism, these all require consideration.

Burglar-proof safes.

The most acceptable construction for the body of a burglar-proof safe is generally conceded to be that of laminated plates, the walls being built up of layers of steel of different thicknesses, riveted through adjacent plates—none of the rivets passing through the whole series of plates, but being offset, so that drilling through a rivet would terminate after the thickness of two plates had been pierced. The plates are made of different thicknesses, and are usually alternately hard and soft, the outer plate being heavier than the others, and very hard. The change from hard to soft, or *vice versâ*, is almost certain to break any drill which may be employed, and thus greatly prolongs the time required for penetration. The latest improvements in the manufacture of steel have been utilized in providing material for this work, both chrome steel and manganese steel having been employed for the hard plates, the latter material with especial success.

The door of a safe may be attacked in various ways. Drilling is resisted by the use of a similar construction to that used for the walls of the safe. The door itself is accurately fitted to its seat by a series of offset bearings, in order to prevent the introduction of wedges; and the bolts shoot in all four directions, in order to hold the door in place independently of the hinges, which are only used to carry the open door. In order to prevent the use of liquid explosives, as described below, one or more tongue-and-groove joints are provided, an elastic packing being fitted in the grooves, and the door forced up to its seat by a powerful cam or lever device. The hinge in such construction is of the so-called "crane" type, enabling the door to be brought round squarely in front of its seat and pushed directly up to its bearings. In many modern safes the door is round instead of being rectangular; this form enables it to be ground to a bearing very effectively after hardening. When a door is thus made and fitted, it is found that the joint offers no less resistance to attack than the walls of the safe. The bolts by which the door is secured are usually thrown by a special handle attached to a spindle passing through the door, the bolt-work being locked in position by a separate locking mechanism,

controlled by one or more combination dial locks with separate spindles. These spindles must be very closely fitted and packed, otherwise they become points of weakness, at which liquid explosives may be admitted. If it is intended to prevent this weakness of a perforated door, an automatic bolt-work is employed, the bolts being thrown by springs upon the closing of the door, and retracted by another set of springs after the lapse of a determinate period of time controlled by a time lock.

Modern vault construction is practically burglar-proof safe-work on a far larger scale. The walls are best made of laminated steel plates, alternately hard and soft, fitted and riveted in the most solid manner, and of such thickness that the time required for drilling materially exceeds, even in the most favourable circumstances, the time available for attack. There are usually two doors, a heavy outer door, carrying the main locking mechanism, and ranging from 8 to 11 inches in thickness; and an inner door, with dial locks, adapted for quick and secure closing in case of sudden alarm. The interior of such vaults is fitted with tiers of drawers and boxes; the partitions being of sheet steel, and each drawer having its own lock. These compartments are of various sizes, and may either be used solely for the purposes of the institution owning the vault, or, more frequently, may be rented for safe-deposit purposes to customers. The compartments are generally furnished with key locks, the usual form having two keyholes and requiring the use of two keys, one of which is in the possession of the renter and the other in the hands of the vault attendant. The combination operated by the attendant's key is identical in all the locks, and this key must be turned before the renter's key can be operated; this arrangement requires the identification of the renter by the attendant, but at the same time gives the latter no access to the compartment.

The main points of difference in various vaults lie in the mechanism by which the door is secured. While reference must be made to Lord Grimthorpe's article on Lock (*Ency. Brit.* vol. xiv.), for the state of the art down to the date at which he wrote, some later features may here be added. Key locks are now only suitable for use on inner compartments of safes or vaults, the most secure of this type being the improved forms of Yale lock. The main improvement consists in the deep corrugation of the keyway, forming what is termed the "paracentric" construction, an arrangement which effectively prevents the vertical motion of any picking tool which might be inserted with the intention of lifting the pins and picking the lock by the so-called "tentative" method. Dial locks, or, as they are sometimes termed, combination locks, are generally employed for fire-proof safes; and when carefully constructed with packed spindles and balanced fence, are also suitable for burglar-proof work. The dial lock is fitted with two, three, or four circular discs or tumblers on one spindle, each tumbler having a gating or square notch at one point in its periphery. When all the gatings coincide with each other and are at the proper point with regard to the "fence" or releasing member of the locking mechanism, the bolts may be thrown back. As each tumbler is free upon the spindle, and is turned only by a projection upon the adjacent tumbler, the correct unlocking position can only be given to all the tumblers by the proper rotations of the knob upon the dial outside the safe. The numbers on the dial indicate the positions of the tumblers within to the person familiar with the combination to which the lock has been set; to all others it is a "puzzle" with such a vast number of permutations as to render the method of "trial and error" out of the question. Taking a lock with 100 divisions, the number of changes with one tumbler would be 100; with two tumblers, $100^2 = 10{,}000$; with three tumblers, $100^3 = 1{,}000{,}000$; and with four tumblers, $100^4 = 100{,}000{,}000$. Additional security is obtained by the use of two independent dial locks, each operating the same bolt mechanism. This arrangement may be employed in various ways, the most usual being with two locks set to the same combination, either lock releasing the bolt-work, or with two locks set to different combinations, and both requiring to be correctly set before the bolts can be thrown, the secrets of the combinations being in the possession of two different persons. This latter method is intended to prevent the dishonest access to the vault by either custodian, the presence of both being required.

Dial locks.

Time locks.

A number of years ago there occurred in the United States many masked burglaries. The thieves entered the residence of the cashier or other custodian at night, and under threat of death or torture compelled him to go with them to the vault and unlock the combination of the vault. They then looted the place at their leisure, and left the custodian bound. The result of this form of attack was the introduction of the time lock. The original form of the time lock was merely that of a simple clock movement, similar in mechanism to that of an ordinary alarm clock, except that instead of releasing an alarm at a predetermined time, an obstruction was introduced to the movement of the bolt-work which effectually prevented the retraction of the bolts, even when the combination lock was correctly set. At the proper time the clockwork lifted the obstruction, and the bolts could be withdrawn. It will be seen that this addition did not change the security given by the combination lock, but added to it the mechanical limitation of operation to certain hours, and made it impossible for compulsion to be employed at other times. The time lock in this form practically put an end to masked burglaries, but introduced a new difficulty, namely, the "lock-out." Any failure of the time lock to perform its work rendered it impossible for the proper persons to operate the lock; and at first it was feared that this defect might be a serious objection. The next improvement was the introduction of the double time lock, in which there were two independent movements, either of which operated the mechanism; and this was followed by the triple and the quadruple time locks, this reduplication of movements giving practically complete immunity from danger of lock-out from stoppage of the clockwork.

Automatic bolts.

With the perfection of modern high explosives a new form of attack was developed. It was found that nitroglycerine could be so diluted as to become so exceedingly limpid that it could readily penetrate joints hitherto supposed to be liquid-tight. Thus if a gutter of clay be formed along the top joint of a safe or vault door and filled with the liquid, in a short time it will be found to have passed in through the crack. In like manner a cup of clay, formed round the knob of a dial lock, or about the T-handle by which the bolts were operated, could be filled with the liquid explosive, which in a few minutes would penetrate through the space about the spindle, no matter how carefully fitted. The concussion of an exploding primer, attached to the outside of the door, would then explode the charge within and blow the door off. Although this form of attack has been provided against by packing the door joints and spindles, to prevent the access of liquid explosives, a more effective defence is that of employing automatic bolt mechanism, which requires the use of no holes whatever through the door. In automatic bolt devices powerful spring mechanism is employed to shoot and retract the bolts, there being two sets of springs, one to lock the door and the other to

unlock it. These springs require to be compressed by hand, a powerful lever mechanism being used, and each set is caught when compressed, and held by a suitable trigger. The trigger of the locking springs is released when the door is tightly closed, and the bolts are shot. When the predetermined time has elapsed, the unlocking springs are released by the time lock, and the bolts are retracted and the door may be pulled open. It will be seen that this mechanism introduces anew the danger of lock-outs by reason of its possible failure to act, and the difficulty has been met in the same manner as in the time lock, *i.e.*, by the duplication of the parts.

The direction in which modern bank locks and locking appliances have advanced may be described generally as inaccessibility from the exterior of the door. The difficulty with all key locks, however complicated, was that they were accessible through the keyhole, so that explosives could be introduced; and also that the loss of the key itself, or its illicit possession, would enable any one readily to open the lock. In the first forms of combination locks the construction was such that by the manipulation of the dial a skilful operator could form an accurate judgment of the positions of the tumblers, and was thus enabled to pick the locks. Modern combination locks are so constructed that by means of independent bearings, which are operated through the revolution of the spindle, and by use of a balanced fence arbour (that is, the connecting piece between the spindle and the tumblers), it is impossible for any one manipulating the spindle or the dial to form any idea of the position of the tumblers on the inside, because the moment the spindle is revolved, the fence arbour is lifted away from the tumblers, and there is no possibility of feeling their motion. The only way, therefore, of opening the modern combination lock is by knowledge of the combination, or by forcing the one who has the combination to open the lock, either by torture or by threats of death.

Recent devices.

The next step was to add to the combination lock a time lock which had no connexion with the exterior of the door, and which, when set to remain locked for a certain period, could not be opened by any one. This was followed by the attack by liquid explosives, as discussed above, and the new attack was opposed by the new defence of the automatic bolt-throwing devices. The modern time lock is protected against unlocking by jarring, whether from explosives or otherwise, by having all its time-movements and locking mechanism mounted upon a movement block, which is cushioned on springs at its back and front, so that all the operative mechanism is, as it were, floating. The mechanism is operated generally by three, sometimes by four, time-movements, each of which is entirely independent and fully able of itself to operate the mechanism, even if all the other movements should stop. Automatic bolt-operating devices are so designed that the effect of jarring will simply be to lock the locking levers tighter. The unlocking mechanism of the best of these is double, so that in case of any accident to part of the mechanism, the reserve mechanism will operate the bolt.

In all the advances which have been made in burglar-proof protection, it will be observed that the burglars are the experts, and as soon as they succeed in penetrating a defence, a new and stronger one is devised. Plans have been suggested by which the locks may be operated electrically from a distance, but that simply removes the point of attack to a new place, and does not constitute any greater protection. At the present time the existing defences, as described above, have held good, and the best modern devices have not yet been successfully attacked. (H. H. S*.)

Saffi, or Asfi, a seaport on the west coast of Morocco, 106 miles west-north-west of Morocco. Although the principal wool and grain port of central Morocco, it is sadly hampered by bad landing in certain weathers. There are several important European business houses, a Scottish mission, and the usual consular officials. Exports: 1896, £92,716; 1900, £143,438. Imports: 1896, £81,730; 1900, £83,073. Shipping: 1896, 68,286 tons; 1900, 84,682 tons. Population, about 15,000.

Saffron Walden, a municipal borough, market town, and railway station in the Saffron Walden parliamentary division of Essex, England, 24 miles north-north-west of Chelmsford. A British and Foreign School Society's training college for mistresses has been opened, and the library of the literary institution reconstructed. Area, 7502 acres. Population (1891), 6104; (1901), 5896.

Sagaing, a division and district in Upper Burma, lying to the south and west of Mandalay. The Sagaing division includes the districts of Upper and Lower Chindwin, Shwebo, and Sagaing, and covers an area of 30,039 square miles, with a population of 821,769 in 1891, and 999,168 in 1901, of whom 463,966 were males and 535,202 females. In 1898–99 it had 3666 villages, paying a revenue of Rs.20,86,158. The Sagaing district has an area of 1862 square miles; population (1891), 246,141, living in 593 villages and paying Rs.6,80,827 in 1898–99. In 1901 the population was 282,691, of whom 132,028 were males and 150,663 females. The inhabitants are almost wholly Buddhists and Jains. Except for a ridge of hills along the Irrawaddy the greater part of the district is flat. Paddy is the chief crop. The total acreage is 1,191,469. Of this, 266,754 acres were cultivated in 1898–99, 253,088 acres were current fallow, 49,562 acres were available for cultivation, and 622,065 acres were not cultivable. The total rainfall in 1898–99 was 31·37 inches, taken at Sagaing. In the hot weather the maximum shade temperature rises to a little over 100° F. The lowest readings in the cold weather average about 56° F. Sagaing, the headquarters town, opposite Ava, a few miles below Mandalay, had a population in 1891 of 9934. The hills above are studded with pagodas, and the town itself is well shaded by large tamarind trees. It was formerly a capital of Burma. It is connected by railway with Myitkyina. A steam ferry connects with the Rangoon–Mandalay line, and the steamers of the Irrawaddy Flotilla Company call daily.

Saganeiti. See Eritrea.

Sagasta, Praxedes Mateo (1827–——), Spanish statesman, was born on 21st July 1827, at Torrecilla de Cameros, in the province of Logroño. He began life as an engineer, and from his college days he displayed very advanced Liberal inclinations. He entered the Cortes in 1854 as a Progressist deputy for Zamora. After the *coup d'état* of O'Donnell in 1856, Sagasta had to go into exile in France, and promptly returned, to become the manager of the Progressist paper *La Iberia*, and to sit in the Cortes from 1859 to 1863. He seconded the Progressist and revolutionary campaign of Prim and the Progressists against the throne of Queen Isabella, conspiring and going into exile with them. He returned, *viâ* Gibraltar, with Prim, Serrano, and others, to take part in the rising at Cadiz, which culminated in the revolution of September 1868, that made Sagasta in succession a minister several times under Serrano and then under King Amadeo of Savoy, 1868–1872. Sagasta ultimately headed the most Conservative groups of the

revolutionary politicians against Ruiz Zorrilla and the Radicals, and against the Federal Republic in 1873. He took office under Marshal Serrano during 1874, after the *pronunciamiento* of General Pavia had done away with the Cortes and the Federal Republic. He vainly attempted to crush the Carlists in 1874, and to check the Alphonsist military conspiracy that overthrew the Government of Marshal Serrano at the end of December 1874. Barely eight months after the restoration of the Bourbons in the autumn of 1875, Sagasta accepted the new state of things, and organized the Liberal dynastic party that confronted Canovas and the Conservatives for five years in the Cortes, until the Liberal leader used the influence of his military allies, Jovellar, Campos, and others, to induce the king to ask him to form a Cabinet in 1881. The Liberals only retained the confidence of the king by postponing the realization of almost all their democratic and reforming programme, and limiting their efforts to financial reorganization and treaties of commerce. A military and republican rising hastened Sagasta's fall, and he was not readmitted into the councils of Alphonso XII. On the death of that king in 1885, Sagasta became premier under the regency of Queen Christina, and remained in office until 1890, long enough to carry out all his reform programme, including universal suffrage. A coalition of generals and Conservatives turned Sagasta out in July 1890, and he only returned to the councils of the regency in December 1892, when the Conservative party split into two groups under Canovas and Silvela. In his tenure of office from 1892 to March 1895 Sagasta did not do much, and he had to cope with many difficulties, including a serious conflict with Morocco, in which he averted a war and secured a heavy indemnity for the aggression of the Riff tribes on Melilla. He was still in office when the final rising of the Cubans began in February 1895, and he had to resign in March of the same year because he could not find generals or superior officers in the army willing to help him to put down the turbulent and disgraceful demonstrations of the subalterns of Madrid garrison against newspapers which had given offence to the military. Sagasta kept quiet until nearly the end of the struggle with the colonies, when the queen-regent had to dismiss the Conservative party, much shorn of its prestige by the failure of its efforts to pacify the colonies, and by the death of its chief, Canovas del Castillo. Sagasta gallantly undertook the hopeless task of conciliating both the Cubans and the United States by a tardy offer of colonial home rule, the recall of General Weyler, and other concessions that did not avert either the disastrous war with the United States or the loss of Cuba, Porto Rico, and the Philippine Islands. The Liberal party and Sagasta paid the penalty of their lack of success, and directly the Cortes met after the peace treaty of 12th December 1898 with the United States, they met with a parliamentary defeat in the Senate that sent them into the cold shade of opposition. Sagasta did not obstruct too much the Conservative Cabinet that undertook to reorganize Spain after the loss of her colonies. He ever pursued his policy of playing into the hands of the sovereign whilst keeping up the appearances of a Liberal, almost democratic, leader, skilful in debate, a trimmer *par excellence*, and abler in opposition than in office.

Sagastyr, an island of Russian Siberia, at the mouth of the Lena, situated in 73° 22′ 48″ N. and 126° 35′ E. It was during the years 1882–83 the seat of an International polar station. The average temperature throughout the year, from two years' observations, appears to be 1° F.

Saginaw, a city of Michigan, U.S.A., capital of Saginaw county, on both banks of the Saginaw river, at an altitude of 589 feet. The city has a level site, a regular street plan, is divided into fifteen wards, has good water-supply and sewerage systems, and is well paved, mainly with wood. The river is navigable for large vessels from Lake Huron to this point, making it practically a lake port and giving it a share of the lake commerce. It has four railways, the Grand Trunk, the Pere Marquette, the Michigan Central, and the Saginaw, Tuscola and Huron, which afford ample means for inland trade. Saginaw is situated in a farming, lumber, and salt region, and its manufactures are related to these industries. In 1900 it had 480 manufacturing establishments, with a total capital of $7,558,806. They employed 4866 hands, and the product was valued at $10,034,499. The most important of these products was lumber, the value of which was $2,647,461. The product of foundries and machine shops was valued at $1,256,183. Flour was manufactured to the value of $412,962. The assessed valuation of real and personal property was, in 1900, $18,998,090; the net debt of the city was $1,314,326; and the tax rate $19.80 in the east district and $21.96 in the west district per $1000. The city was formed on 1st April 1890 by the consolidation of the former city of Saginaw with East Saginaw. Population (1890), 46,322; (1900), 42,345, of whom 11,435 were foreign-born and 348 negroes.

Sahara, the great desert of northern Africa, with an area, according to Dr Bludau's calculation of the areas of African river basins, of 3,459,500 square miles, which is made up as follows:—

Drainage or slope to Atlantic	131,000	square miles.
,, Mediterranean	502,000	,,
,, inland	2,602,500	,,
Slope to Niger basin	224,000	,,
Total	3,459,500	,,

This includes Tripoli and Fezzan, which practically belong to the desert zone, but does not include arid portions of the basins of the Nile and Niger, in which the drainage is at most intermittent, and which might with reason be included in the Sahara. The area would thus be brought up to at least $3\frac{1}{2}$ million square miles.

Although some additions to our knowledge of the Sahara by exploration were made within the last dozen years of the 19th century, the most valuable results have been obtained by the study of material already available, which has thrown considerable light on the physical history of the region.[1] An admirable investigation of this, and summary of our knowledge of Saharan geography in all its aspects, was published in 1893 by M. Henri Schirmer, whose conclusions may be briefly summarized here. M. Schirmer contests the idea that the desert nature of the Sahara has been acquired within comparatively modern times, showing that it is due to forces which have been at work for ages in the region in question, although, as in all deserts, the dryness is probably progressively increasing. The primary cause is to be sought in the existing distribution of land and sea, the great land mass of North Africa causing an outflow of air in all directions (and consequent absence of rain) in winter, and an indraught in summer, when the surface is intensely heated and the relative humidity of the atmosphere becomes so small that condensation is all

[1] M. de Lapparent has called attention to a marine fossil of Cretaceous age brought home by Monteil from the central Sahara, as indicating that in Cretaceous times that region was covered by the sea, and so modifying current views as to its geological history (see *La Géogr.*, 1901).

but impossible. To this must be added that the vicinity of the comparatively cool Mediterranean in the north accentuates the force of the winds from that direction, which, blowing as they do towards a lower latitude, are in their very nature dry winds. The influence of mountain ranges, such as the Atlas, round the border of the desert, is thus but a subordinate cause of the latter's dryness, which would probably be little diminished did the Atlas not exist. This dryness reacts again on the temperature conditions of the Sahara, accentuating both the daily and annual variation. The intense heat of the days is compensated by the cold of the nights, so that the mean annual temperature is not excessive. The difference between the mean temperature of the hottest and coldest month has been found to be as high as 45° F., and the extreme range at least 90° F., maxima of 112° and over having been frequently observed. As a result of the extreme dryness of the air, evaporation is excessive, and, being greater than the precipitation, involves a progressive desiccation of the Sahara. This being the case, it is plain that any attempt to improve the climatic conditions of the Sahara as a whole, which some have considered possible, can hardly meet with real success. Much may, however, be done to modify local conditions, and fairly satisfactory results have been obtained within recent years, in the direction of fixing the dunes and covering them with a growth of vegetation. Experiments carried out at Ain Sefra, on the northern border of the desert, have shown that by protecting the sand from the action of the wind by a litter of alfa grass, time is given for the establishment of suitable trees, which include the tamarisk, acacia, eucalyptus, prickly pear, peach, and aspen poplar, the last-named having proved the most capable of all of resisting the desert conditions. Such planting operations can only be carried out in favourable localities, such as valleys in which a certain amount of water is available. Wide areas like the arid stony plateaux (Hammada) must be abandoned as hopeless, so that a change for the better in the general atmospheric conditions of the Sahara is certainly not to be looked for.

Our knowledge of the history and mutual relations of the races who inhabit the Sahara is still very imperfect, but the facts have been well summarized by M. Schirmer. The attempts made by many explorers and writers to trace in certain of the existing inhabitants the remnants of an aboriginal race of negro affinities, which inhabited the Sahara before the arrival of the Berbers and Arabs, is, he shows, not justified by the facts at our disposal. That negro influence is to be seen in various parts is undeniable, but it can be shown to date from a much more recent period than has been supposed. The connexion between many of the place-names in Fezzan and the language of Bornu is attributable, *e.g.*, to the northward extension of the influence of the Bornu-Kanem empire between the 11th and 14th centuries of our era. The allusions by classical writers to Æthiopians as inhabitants of the Sahara prove little, in view of the very vague and general meaning attached to the word by many ancient authorities. The physical characters, and especially the dark colour, of many of the Saharan populations is apparently a stronger argument, but even this is capable of another explanation. Caravans of negro slaves have from time immemorial passed northwards along the main desert routes, and it is just in the oases on these that the dark element in the population is chiefly found. It may therefore be attributed to the intermarriage of the original lighter inhabitants of the oases with such slaves. The Tebu or Teda, once thought to be almost pure negro, who inhabit the east-central portion of the desert, proved, when examined by Nachtigal in Tibesti, where they are found in greatest purity, to be a superior race with well-formed features and figures, of a light or dark bronze rather than black. Their language is related to that of the Kanur in Bornu, but it appears that these have derived theirs from the Tebu, not the Tebu from the Kanur. Physically, the Tebu appear to resemble somewhat the Tuareg, their western neighbours, but their true affinities have so far remained unsolved.

The chief centres of population in the Sahara are, firstly, the oases, which occupy positions where the underground water makes its way to the surface or is readily reached by boring; and, secondly, certain mountainous districts where the atmospheric moisture is condensed, and a moderate rainfall is the result. Except in the south of Algeria, where cultivation has been extended by means of artesian wells, the condition of the Sahara oases is far from prosperous. A feeling of insecurity has been engendered by the marauding habits of the nomad tribes; cultivation has become more restricted; and the decline of the caravan trade has brought ruin to certain centres, such as Murzuk. The most important are the oases of the Tuat region, especially Insalah; those of Rhat and Ghadames, on the route from Tripoli to Zinder; and of Kufra, in eastern Sahara. The various confederations of the Tuareg, in central Sahara, are grouped round hilly districts, which serve them as refuges from their enemies. The most important are the Awellimiden, on the left bank of the Middle Niger; and the Kel-Ui, grouped around the mountainous districts of Air or Azben; the two northern confederations, those of the Ahaggar and Azjer, being less powerful. The chief centre of the former seems to be the mountainous district of Aderar or Adghag (not to be confounded with Adrar in western Sahara), which lies north of the Middle Niger, but has not yet been visited by any European. Much information respecting the present state of the confederation was, however, obtained during the voyage down the Niger, in 1896, of Lieutenant Hourst, who was much struck with its powerful organization under the chief Madidu. The Kel-Ui of Air have not maintained the purity of their race to the same extent as other divisions of the Tuareg, showing some signs of mixture with a negroid race, which is still to be found in the country as the result of former relations with Hausa and Songhai stocks. The residence of the sultan is at Agades, which has some importance as a halting-place of caravans, though less than formerly. When visited by M. Foureau in 1899, more than half of its area, which is considerable, was found to be occupied by ruined houses. Those still intact are built of mud, some having an upper storey. A few houses of a better style belong to merchants of Tuat or Tripoli. The sultan's residence, however, has architectural merit, being a massive two-storeyed structure pierced with small windows. The mosque, with its minaret in the form of a truncated pyramid, still remains as in Barth's time. The country receives a fair amount of rain during the summer, and the valleys are green and dotted over with trees of the mimosa class. Little of the land is, however, cultivated.

Other mountainous districts in which a certain amount of rain falls regularly, and which contain a population above the average for the Sahara, are Tibesti and Borku, in the east centre, and Adrar, in the west. Tibesti, which, as already stated, is peopled by the Tebu race, lies on the line of elevation, with a core of crystalline and volcanic rocks, which traverses central Sahara from south-east to north-west. In the mountain group of Tarso it rises to an average height of some 7000 feet, the volcanic cone of Tussido probably approaching 8000 feet. The slopes are bare and rocky, the summer rains running off quickly by the beds of watercourses which traverse the valleys. The occupation of the inhabitants is mainly pastoral. Borku lies to the south-east, in part on the same line of heights, and is also inhabited by the Tebu, but the extent of inhabited country is smaller. Adrar is still imperfectly known, the attempts made by travellers to reach it having met with little success. In 1900 the oasis of Atar, on the western borders of the country, was reached by M. Blanchet. It has a permanent population of 2000, but is described as a wretched spot. The other centres are Shingeti, Wadan, and Ujeft, Shingeti being the chief commercial centre, whence caravans take to St Louis gold-dust, ostrich feathers, and dates. A considerable trade is also done in salt from the sebkha of Ijil, in the north-west. Adrar occupies the most elevated part of a plateau which ends westwards in a steep escarpment and falls to the east in a succession of steps.

During the last two decades of the 19th century considerable changes have come over the commercial and political relations of the Saharan populations, even apart from the attempted extension of European influence over that region, to which reference will shortly be made. The most important fact is without doubt the great impetus which the Senussi movement has received during that period, especially in eastern Sahara. The chief centre of this powerful and fanatical sect is now at Kufra, on

the northern border of the Libyan desert, while the old focus of Senussism Jarabub now serves as a kind of university for its adherents. One of the main doctrines of the sect is that of emigration from infidel countries, under the influence of which new centres are coming into prominence and new routes being opened, while the quasi-masonic brotherhood of the members facilitates intercourse between widely-distant districts. This movement has been one out of several causes which have brought into prominence the desert routes between Wadai in the south and Jalo and Benghazi in the north, which has to some extent superseded some of the older caravan routes across the Sahara. Other causes have tended to reduce the importance of these. The long established route from Darfur to the Kharjah and Dakhilah oases has fallen into entire disuse since the closing of eastern Sudan by the Mahdist troubles, though with the cessation of these it may possibly again acquire importance. Again, the route from Kuka in Bornu to Tripoli, by Murzuk, which had been for some time sinking in importance, has now practically fallen into disuse, largely in consequence of the political troubles in Bornu since its conquest by the adventurer Rabah. The next in order towards the west of the great trade routes—that leading from Tripoli *viâ* Ghadames and Rhat, to Zinder, Kano, and other great centres of the Hausa States—has up to the present maintained its importance, but with the opening of trade from the side of the Niger may be expected in time to decline. This has already been the fate to some extent of the routes across western Sahara to Timbuktu, owing to the opening up of a route from Medina on the Senegal *viâ* Nioro to the Upper Niger, by which European goods now make their way to western Sudan. The old route will, however, retain some of its importance on account of the salt trade from the Sahara, which still centres at Timbuktu.

The extension of French influence over central and western Sahara, so long a desideratum on the part of that nation, has of late years made a decided advance. The work of French pioneers to the south of Algeria was recognized in 1890 by the Anglo-French agreement, which assigned to France the whole central Sahara from Algeria to a line from Say on the Niger to Lake Chad; and this was soon followed (1892) by Monteil's great journey from Senegal to Lake Chad and across the desert to Tripoli. The southern limit of the territory was, however, not strictly defined until 1898, when a new agreement gave to France a rectangular block south of the line mentioned, including the important frontier town of Zinder. To the north-east and east the boundary of the French sphere was defined, by the supplementary declaration of 1899, as running south-east, from the intersection of the Tropic of Cancer with 16° E., until it meets the meridian of 24° E., following this south to the frontier of Darfur. French Sahara is thus connected with French Sudan in the south-west, and with the Congo–Shari territories on the south-east. On the west, where Spain claimed the Sahara coast between Capes Blanco and Bojador, the interior frontier was defined by the Franco-Spanish agreement of 1900, being so drawn as to leave to France the whole of the country of Adrar, the boundary north of the tropic being the 12th meridian east of Greenwich. French authority has been established over a small part only of the vast area included within the above boundaries. South of Algeria military posts have been gradually pushed into the desert, El Golea being until 1900 the farthest point which acknowledged French rule. The great desideratum was the opening up of a route to the Sudan which might in time divert the trade from Tripoli to Algeria, but all attempts long proved fruitless, owing to the dangerous character of the tribes by which the way was infested. In 1886 Lieutenant Palat was murdered a little south of Gurara, and in 1889 the same fate befell Camille Douls in Tidikelt (Tuat) in his attempt to reach Timbuktu from the north. In 1890 F. Foureau—who in 1883 had undertaken a first journey of exploration south of Wargla—reached the Tademayt plateau in 28° N., and in 1892–93 came the first of his long series of expeditions undertaken with a view of penetrating the country of the Azjer Tuareg, the powerful confederacy which lay on the route to Air and Lake Chad, never traversed in its entirety by a European. The borders of their country were reached in the same year by M. Méry, and in 1894 by D'Attanoux, while in 1895–96 M. Foureau did valuable work in the Erg region south of Tunis, between Tuggurt and Ghadames. But all efforts to obtain a passage were unavailing until in 1898–99 this indefatigable traveller, accompanied by an escort of troops under Major Lamy, at last attained his object, finally reaching Zinder, the important trade centre on the borders of the Sudan, on 2nd November 1899.

The important section of M. Foureau's route began at Ain El-Hajaj, in about 26½° N., immediately beyond which the frowning *massif* of Tindesset had to be crossed by a most difficult route among a chaos of rocks and ravines, the geological formation being principally sandstone. After descending the southern escarpment of the "Tassili," the expedition crossed a mountainous region named Anahef, composed of quartz and granite, through which the line of partition between the basins of the Mediterranean and Atlantic was found to run. Beyond this the route lay across the wide plain of quartz gravel, strewn with blocks of granite, known to the Tuareg as Tiniri, to the well of In-Azaua, beyond which a march of eleven days, with a water-supply at one point only, led to the first village of Air, where the Tuareg proved hostile. Agades, the capital of Air, was reached by a march through difficult mountains, with valleys which gradually opened into a wide plain. From Agades to Zinder the route lay, first, through the bare and arid district of Azauak; next, through the bush-covered Tagama, a district abounding in game; and, lastly, through the cultivated country of Damerghu. Zinder had only once before been reached by way of Air—by Barth's expedition in 1850. It was now occupied by a French garrison, established by the expedition from the Niger under Lieutenant Joalland, who had thus retrieved the disasters of the two previous expeditions by this route, the first under Cazemajou, the second under Voulet and Chanoine. M. Foureau's farther route round Lake Chad and south to the Congo does not come within the scope of the present article.

M. Foureau's achievement was quickly followed by increased political activity of the French in the Sahara south of Algeria, where, in addition to the work of explorers already mentioned, surveys had been carried by French officers (especially Captains Germain and Laperrine in 1898) as far as the important centre of Insalah, the position of which had, as a result, been shifted some twenty-five miles east of its former position on our maps, being found to lie in 2° 16′ E., 20° 17′ 30″ N. Early in 1900 M. Flamand, who had been entrusted with a scientific mission to the Tuat oases, came into collision with the natives, and Insalah was occupied by the military escort which accompanied him. This was quickly followed by the occupation of Tuat, and, later, by that of Igli, a position of some importance, as securing the communications with Tuat and the region to the south. As, however, it lies west of the southward continuation of the frontier of Algeria with Morocco, its occupation did not pass without protests on the part of the Moorish authorities, but these are little likely to stem the tide of French expansion in this region. Simultaneously with these events, an attempt was made to pave the way for the establishment of French influence in western Sahara by the expedition of M. Blanchet to Adrar, which had not been visited since the middle of the 19th century. It returned in September 1900, only partially successful, M. Blanchet and his companions having been detained for some time as virtual prisoners on the borders of Adrar. The leader almost immediately succumbed to fever.

The hope of an eventual commercial exploitation of the Sahara rests mainly on the possible existence of mineral wealth, of which nothing is yet known. For the supply of easy communication between Algeria and the Sudan the construction of a railway across the desert has found many advocates, though others have considered the idea impracticable and useless, pointing out that such a route could not hope to compete with the shorter and more natural outlets from the Sudan to the south and west. Two principal routes have been suggested, the one, recommended especially by M. Leroy-Beaulieu, taking an easterly line from Biskra through Wargla to Air (Agades) and Zinder—generally, the route followed by Foureau; the other, of which M. Laferrière is an advocate, starting from the terminus of one of the more westerly railways already existing—preferably that opened early in 1900 to Jenien-bu-Rezg—and reaching Timbuktu *viâ* Igli and the Tuat oases. A third suggested route is one from Igli to the Senegal, still farther west. Pending the possible adoption of any such scheme, it has been suggested that a telegraph line by one of these routes would do good service, while the establishment of a regular caravan service is also advocated.

Saharanpur, a city and district of British India, in the Meerut division of the North-Western Provinces. The city is situated on a stream called the Damaula Nadi, 907 feet above the sea, and 1041 miles north-west from Calcutta by rail. Population (1891), 63,194; (1901), 63,850, of whom more than half are Mahommedans. The municipal income in 1897–98 was Rs.57,253, mostly

derived from octroi, and the incidence of taxation was R.0.12.8 per head. The death-rate in 1897 was 35 per thousand. It is an important junction of the North-Western with the Oudh and Rohilkhand Railway, and point of departure by road for Mussoorie. The Government botanical gardens were established in 1817. There are two high schools, and seven printing-presses, issuing one vernacular newspaper. The district of SAHARANPUR has an area of 2242 square miles. Population (1881), 979,544; (1891), 1,001,280; (1901), 1,046,412, showing an increase of 2 per cent. in the earlier and 4 per cent. in the later decade.

The land revenue and rates are Rs.18,69,282, the incidence of assessment being R.1.8.4 per acre; cultivated area (1897–98) 739,651 acres, of which 188,983 were irrigated, including 122,642 from Government canals; number of police, 2650; vernacular schools, 151, with 4665 pupils; registered death-rate (1897), 35·6 per thousand. The principal crops are wheat, rice, pulse, maize, sugar-cane, and cotton.

Saidapet, a town of British India, administrative headquarters of the Chingleput district of Madras; station on the South Indian Railway, 5 miles south-west of Madras city by rail, from which it is separated by a line of tanks. Population (1881), 4917; (1891), 5702. There is a Government college of agriculture, with museum, chemical laboratory, and veterinary hospital. The model farm, established in 1865, is now attached to the college. The Government teachers' college, with 46 students in 1898, has a hostel or boarding-house for Brahmans, opened in 1897. The high school, used as a practising school, had 303 pupils in 1898.

Saigon, capital of French Indo-China, on the right bank of the river Saigon, about 8 miles from its junction with the Donnai, 34 miles from the sea. Before the French conquest, Saigon, then known as *Gia-dinh-thanh*, was the capital of Lower Cochin-China, which consisted of the "six southern provinces," and constituted a vice-royalty under the government of a *kinh-luoc*. The population, which at the time of the French occupation did not exceed 5000 or 6000 inhabitants, rose in 1882 to 13,348, and in 1896 to 44,764 of whom 3258 were Europeans or *assimilés*, namely, nationalized persons, and 41,506 Asiatics. Of these latter, 25,411 were Annamese, 13,801 Chinese, and the remainder Asiatic foreigners. The town covers an area of 1730 acres. It is enclosed in an irregular trapezium, formed by the river Saigon on the east, the Chinese Arroyo on the south, and the canal on the west. The streets are wide and straight, running in parallel lines or united at right angles. Double rows of trees give shade in all the streets and boulevards. All public offices are situated in the upper part of the town. The floating-dock, sunk several years ago, is furnished with a repairing-dock in which vessels of the largest size can be accommodated. The movement of the port in 1898 was as follows: 598 arrivals, 579 departures, representing 731,368 tons entering and 729,781 clearing. In the same year French vessels made 444 entries and departures, carrying 609,008 tons; British vessels, 310, carrying 426,040 tons (an increase on 1897 of 61 entries and departures and 65,555 tons); German vessels, 279, carrying 314,939 tons (a decrease on 1897 of 32 entries and departures and 45,545 tons); Japanese vessels 42 entries and departures, with 67,580 tons. The arsenal of Saigon occupies an area of 55 acres. The town is lighted by gas and electricity. Its water-supply is secured by a filtering-basin, which yields 16,000 cubic metres daily. Three great banks are established in Saigon: the Bank of Indo-China, the Hong Kong and Shanghai Banking Corporation, and the Chartered Bank of India, Australia, and China. The Messageries Maritimes and the Messageries Fluviales have their headquarters at Saigon. The channels of the river Saigon between the town and the sea have been dredged, widened, and rendered available at all times. At a distance of 3½ miles from Saigon, to which it is united by a railway, lies Cholon, or Cholen, "the great market," the largest commercial town of Cochin-China. Its population is almost entirely Asiatic, and has more than trebled since 1885. In that year it had only 40,000 inhabitants; in 1901 it numbered about 127,000, among whom were a smaller proportion of Chinese than formerly. There are 41,500 Chinese in Cholon, 80,061 Annamese, 135 French, and 15 nationalized; the remainder consists of Cambodians and Asiatic foreigners. During the rice season the town is visited by a floating population of more than 20,000 persons. Cholon is traversed by two railways. The Chinese Arroyo is frequented by innumerable boats. Cholon is administered by a municipal council, composed of French, Annamese, and Chinese traders. An administrator of native business, nominated by the governor, fills the office of mayor. The rice trade is the leading industry. The rice is treated in seven immense steam mills (the husks being used as fuel), which daily treat 96,400 piculs of paddy (the mill picul weighs 68 kilogrammes), yielding 44,000 piculs of rice cargo and 24,200 piculs of white rice. There are also, in Saigon, copper foundries, potteries, and marqueterie works.

(J. M. A. DE L.)

St Albans, a city, municipal borough, and market town in the St Albans parliamentary division of Hertfordshire, England, 20 miles north-west of London by rail. The renovation of the cathedral by Sir Gilbert Scott was completed by Lord Grimthorpe in 1894. Modern erections are a technical school, a hospital, and a hospital for infectious diseases. A public park of 24 acres was opened in 1894, and a recreation ground in 1898. The industries include brush-making and letterpress and chromo-lithographic printing. Area, 997 acres. Population (1891), 12,898; (1901), 16,019.

St Albans, a town of Vermont, U.S.A., capital of Franklin county. It is in the north-western part of the state, 3 miles from Lake Champlain, and on lines of the Central Vermont Railway, at an altitude of 390 feet. The surrounding country is largely devoted to dairy farming, and the town has considerable trade in its products. It is the headquarters of the Central Vermont Railway, and contains its car shops, &c. Population (1890), 7771; (1900), 6239, of whom 1201 were foreign-born.

St Andrews, a city, royal and parliamentary burgh (St Andrews group), and university town of Fife, Scotland, on a bay of the German Ocean, 11 miles south-south-east of Dundee by rail. The increasing interest in golf, and the educational enterprise manifested by the university, have furthered the prosperity of the city. The golf links were acquired by the town in 1894, and an additional course was opened in 1895. For the Roman Catholics an iron church was erected by the Marquis of Bute in 1885. The University College of Dundee was in 1890 affiliated to, and made to form part of, the university of St Andrews. This arrangement was set aside by the House of Lords in 1895, but a reaffiliation took place in 1897. In 1887–88 a common dining-hall for the students was established; in 1892 provision was made within the university for the instruction of women; and for the board and residence of lady students a permanent building was opened in 1896. In 1889–90 a large addition was made to the university library building, and to the south of the library new medical buildings, erected in the English Renaissance style, by the munificence of the Marquis of

Bute, were opened for classes in October 1899. The annual number of matriculated students is over 400, including about 120 at University College, Dundee. The endowments of the university have been greatly increased through private bequests, the annual value of bursaries, scholarships, and prizes open for competition being about £3000. Dr Donaldson became Principal in 1886 in succession to Tulloch, and Lord Balfour of Burleigh was installed as Chancellor in 1901. In addition to the town-hall there is a large volunteer hall, and a recreation hall with tennis courts. A new marine laboratory, erected by Dr C. H. Gatty, was opened in 1896, and a boys' brigade hall was completed in 1900. Population of the royal and police burgh (1891), 6853; (1901), 7621.

St Austell, a parish and market-town, Cornwall, England, in the St Austell parliamentary division of the county, 14 miles north-east of Truro by rail. Public rooms were erected in 1895 at a cost of £5000. Other public buildings are Liberal club (1890), Bible Christian chapel (1890), Y.M.C. Institution (1894), Baptist chapel (1900), masonic hall (1900), and Exchange (1900). St Austell is the centre of the China clay (kaolin) district. About 400,000 tons are annually despatched to the Potteries and Lancashire. The tin and copper mines of the district have added to the prosperity of the town. An extensive steam brewery was built in 1893. Population (1891), 11,377; (1901), 11,761.

St Bees, a township and railway station in the Egremont parliamentary division of Cumberland, England, on the coast, 4 miles south of Whitehaven. The nunnery of St Bega, founded about 650, was succeeded in 1120 by a Benedictine priory, to which belonged the present parish church, restored in 1855–58. St Bees College, founded in 1816 for the theological education of Church of England students, was closed in 1897. The free grammar school, founded 1583, is liberally endowed, and has many scholarships and exhibitions. Area, 1814 acres. Population (1881), 1142; (1901), 1236. The ancient parish includes Whitehaven.

Saint-Bon, Simone Arturo (1823–1892), Italian admiral, was born at Chambéry on 20th March 1823. Leaving the Naval Academy in 1847, he attained the rank of commander in 1860, and that of vice-admiral in 1867. He took part in the Crimean war, distinguished himself in 1860 at the siege of Ancona, and was decorated for valour at the siege of Gaeta. At the battle of Lissa, in 1866, his vessel, the *Formidabile,* forced the entrance of the port of San Giorgio and silenced the Austrian batteries, for which exploit he received a gold medal. In 1873 he was elected deputy, and appointed by Minghetti to be minister of marine, in which position he revolutionized the Italian navy. Insisting upon the need for large battleships with high powers of attack and defence, and capable of fighting as single units, he introduced the colossal types of which the *Duilio* and the *Dandolo* were the earliest examples. Falling from power with the Right in 1876, he resumed active service, but in 1891 was again appointed minister of marine. His death on 26th November 1892, while still in office, precluded the accomplishment of his naval programme, but his name is still revered in Italy as that of the originator of the modern Italian fleet.

St Brieuc, chief town of department Côtes du Nord, France, 278 miles west-south-west of Paris, on the railway from Paris to Brest. There are important iron and steel works, and wool-spinning and dyeing are flourishing industries. Its port is Le Légué, at the mouth of the Gouet. Including coasting trade, the total movement in 1900 was 84,517 tons. Nearly all the foreign trade is with England, from which the chief imports are metals and coal. Population (1881), 12,029; (1901), 22,198.

St Catharines, a city of Ontario, Canada, on the Welland canal and the Grand Trunk and St Catharines and Niagara Central railways, 30 miles north-west of Buffalo. The principal industrial establishments are the electric-car works, bicycle, saw, axe, and canning factories, and flour-mills. It is in the midst of the finest fruit-growing district of Canada. It has electric tramways. Imports (1900–01), $1,537,084. Population (1891), 9170; (1901), 9946.

St Chamond, town, arrondissement of St Étienne, department of Loire, France, 8 miles east-north-east of St Étienne by rail. The manufacture of laces of every variety has grown by rapid strides throughout the district of which St Chamond is the centre. The annual value of the manufactured products exceeds £900,000. There are noted dye-works, and metallurgical manufactures are very extensive. The naval and railway workshops employ a considerable number of hands. Population (1881), 13,713; (1901) (comm.), 15,469.

St Charles, a city of Missouri, U.S.A., capital of St Charles county. It is on the north bank of the river Missouri, 23 miles north-west of St Louis, and on the Missouri, Kansas and Texas and the Wabash railways, in the eastern part of the state, at an altitude of 614 feet. The business portion is built in the bottom lands, stretching along the river, while the residential portion is on the face and summit of the cliffs. The city has flour-mills and elevators, tobacco factories, breweries, and car works. Population (1890), 6161; (1900), 7982, of whom 966 were foreign-born and 719 negroes.

St Claude, chief town of arrondissement, department of Jura, France, 27 miles in direct line south-east of Lons-le-Saunier, with terminal station on the branch line from La Cluse, on the railway from Bourg to Geneva. The town is situated at an altitude of over 1300 feet, at the confluence of the Bienne and the Tacon; the former crossed by a stone bridge, the latter by a suspension bridge. The cathedral of St Pierre, 13th to 15th centuries, contains fine 15th-century stalls and a reredos of the same period. St Claude has been noted, since the close of the Middle Ages, for its fancy articles in horn, tortoise-shell, hard-wood, ivory, &c., and many establishments are specially engaged in the manufacture of briar-root pipes. Diamond-cutting and lapidary work, introduced in 1870, is a prosperous and expanding industry. The town derives its name from a penitent bishop of Besançon who died in the 12th century in the monastery founded here in the 5th century. The monks subsequently acquired enormous and almost independent judicial authority, and held their retainers in a state of serfdom till the Revolution, refusing to relinquish their claims even when St Claude was constituted a bishopric in 1762. Voltaire pleaded the cause of the serfs, though unsuccessfully, before the Parliament of Besançon, and in memory of his services a

statue was erected to him in 1887. Population (1881), 7129; (1901), 10,449.

St Cloud, a city of Minnesota, U.S.A., capital of Stearns county. It lies on both banks of the river Mississippi, and on the Northern Pacific and the Great Northern railways, in the central part of the state, at an altitude of 1037 feet. Situated in a lumber region, it derives power for its mills from the river. It has many lumber and flour mills and other manufactures of varied character. Population (1890), 7686; (1900), 8663, of whom 1907 were foreign-born.

St Croix, West Indies. See St Thomas.

St Cunegonde, an incorporated city of Hochelaga county, Quebec, Canada, on the north bank of the Lachine canal, adjoining the city limits of Montreal. It contains a college, convent, two schools, rolling mills, a sewing-machine factory, and brass foundry. Population (1891), 9291; (1901), 10,912.

St Denis, chief town of arrondissement, department of Seine, France, 5 miles north of Paris (Nôtre Dame), an important junction on the Northern Railway. Although at the head of an arrondissement, it is only a titular sub-prefecture, separate administration having been suppressed in the department in 1886. Modern erections are an orphanage, founded and endowed in 1886, the monument commemorative of the Revolution, added to the public statues in 1888, and the railway station, 1897. The ancient Hôtel-Dieu was in 1888 converted into a hospital for aged men. Population (1891), 49,275; (1901), 60,808.

St Dizier, a town and railway station, arrondissement of Vassy, department of Haute-Marne, France, 37 miles, in direct line, west-north-west of Chaumont, on the Marne and the Marne and Saône canal. There is a public library and museum. The town is a very important centre of the iron trade, with foundries of iron, steel, copper, and bronze, engineering works, &c. Population (1881), 8582; (1900), 14,601.

St Étienne, chief town of department of Loire, 310 miles from Paris by rail. In respect of population it is the seventh town of France. It owes its importance to its rich coal basin and to the attendant industries. Ribbon weaving occupies 80,000 workpeople (men and women) in St Étienne and its environs, and goods are annually made to the value of £4,000,000, and even of £4,800,000 if the laces (boot and shoe, &c.), for which St Chamond is the centre of production, be included. The work is mainly done in small factories, electricity supplying the necessary motive power—659 weaving factories being thus operated. The manufacture of heavy iron goods occupies 16,000 workmen, the production at St Étienne, St Chamond, and Rive de Gier being valued at £3,200,000. Powerful steam hammers forge the enormous quantities of steel needed for cannon, armour-plating, great locomotive wheels, &c. Some 4000 workmen are occupied in making nails, bolts, locks, wire, and agricultural implements. Goods of this class are valued at £800,000 a year. Mines occupy 15,000 men in the extraction of 4,000,000 tons of coal, worth £2,000,000 annually. Exclusive of the national manufacture of arms, private factories make to the yearly value of £400,000. The glass industry in Rive de Gier, St Étienne, &c., amounts to £400,000 per annum. The Company of the Loire for the supply of electricity distributes it for lighting or motive power to 23 communes in the neighbourhood of St Étienne. Population (1886), 103,229; (1890), 120,300; (1901), 139,350.

St Gall, a Swiss canton. It ranks officially and politically as the 14th canton, but in area it is the 6th; the total area being 779·3 square miles, of which 661·4 are reckoned as "productive"—forests cover 149 square miles, vineyards 2·1, and arable or pasture land the remaining 510·3. In 1880 the population was 209,719, and in 1888 228,174, while in 1900 it was 250,285. The canton is practically only German-speaking. In 1900 the canton had 321 inhabitants per square mile. In 1900 the following towns in the canton besides the city of St Gall had populations exceeding 5000:—Tablat (12,590), Altstätten (8724), Straubenzell (8090), Rorschach (9140), Gossau (6051), and Kirchberg (5025). The canton is divided into 15 administrative districts. In 1896 the number of "alps" or mountain pastures in the canton amounted to 304, capable of supporting 21,744 cows, and of an estimated capital value of 13,986,700 francs. The cantonal constitution dates from 1890. The legislature is elected by the "communes," each "commune" of 1500 inhabitants or less having the right to one member, and as many more as the divisor 1500 (or a fraction of 750 at the least) justifies. For the election of the 7 members of the Executive all the "communes" form but a single electoral circle. Proportional representation was rejected by a popular vote in 1893. The right of "facultative referendum" and "initiative" as to legislative projects can be exercised if 4000 vote for it, but 10,000 voices are necessary for a demand for the revision of the cantonal constitution. In 1897 the State revenue of the canton was 4,217,913 francs (a rise of nearly 70 per cent. since 1885), and the State expenditure 4,018,457 francs (a rise of over 70½ per cent. since 1885), while in 1898 there was a surplus of 132,013 francs. In 1897 the public debt was 22,400,000 francs.

St Gall, the capital of the above canton, 2208 feet above sea-level, 12½ miles by rail from its port, Rorschach, on the Lake of Constance, and 49¾ miles from Zürich. Its population was 21,204 in 1880 and 33,116 in 1900. Practically German is the only language spoken, and the inhabitants, so far as creed is concerned, are about equally divided between the Protestant and Roman Catholic Churches, though there are a few Jews. The archives of the convents of St Gall and Pfäffers are in the Government offices (part of the old monastery), while the town library is rich in works relating to the Reformation.

(W. A. B. C.)

St Helena, an island possession of Great Britain, situated in the South Atlantic Ocean, in 15° 55′ S. and 5° 42′ W. It is a Crown colony, administered by a governor and executive council consisting of three members. The climate is exceptionally healthy, being kept cool by the south-east trade wind and by the cold waters of the South Atlantic current. Farm and garden produce constitute the whole wealth of the colony, and there is no trade except that connected with supplying provisions to the garrison and to passing ships. The prosperity of St Helena was destroyed by the Suez Canal and the disuse of sailing vessels. The annual revenue is now not more than about one-third of its former amount. Custom duties are the chief item, and in 1898 amounted to less than £5000, against an average of £16,000 in the three years preceding the opening of the Suez Canal. In 1900 they amounted to nearly £10,500 owing to the

presence of the Boer prisoners of war and of British troops and sailors. There is practically no export trade, though a certain amount of specie is annually exported. The resident population in 1891 showed a decrease of 14 per cent. from that of 1881, which in turn had been less by 23 per cent. than the figures of 1871. The civil population was in 1891, 3877, of whom 2000 lived in Jamestown. The estimated population in 1900 was 5316, inclusive of troops. There is telegraphic communication between St Helena and Europe and South Africa.

For history under the East India Company see *Extracts from the St Helena Records from 1673 to 1835*, Jamestown, 1885; *Historical Geography of the British Colonies*, vol. iii., *West Africa*, 2nd ed., Oxford, 1900; and M. DANVERS' *Report on the Records of the India Office*, London, 1887. See also *Report on the Present Position and Prospects of the Agricultural Resources of the Island of St Helena*, by D. MORRIS (printed for the Colonial Office), 1884, and *Colonial Reports*—Annual.

St Helens, a municipal, county (1888), parliamentary borough, and market-town of Lancashire, England, 193 miles north-west of London by rail. A canal communicates with the Mersey. The borough was in 1893 extended, and the enlarged borough constituted the township of St Helens. Modern erections are two Established churches, the Cowley schools, seven voluntary schools, public baths, and the Gamble Institute, erected and presented by Sir David Gamble, Bart., for a technical school and library, costing about £30,000, and educating some 2000 students. Victoria Park (36 acres) was opened in 1887, Thatto Heath Park (17 acres) in 1890, Taylor Park (48 acres) in 1893, and three further recreation grounds, comprising in all 44 acres, in 1901. Besides St Helens hospital (1873) and Rainhill county lunatic asylum, enlarged in 1886, there are a Roman Catholic hospital (1884) and two isolation hospitals, one of which was extended in 1893, 1896, and 1898. Works for the disposal of the sewage, costing about £50,000, date from 1890. In 1891 there were 4845 males and 573 females engaged in the manufacture of glass, 1748 persons in that of alkali, 4320 in coal-mining, and 538 in the manufacture of iron and steel. The municipal and county borough, as extended, has an area of 7254 acres. Population (1891), 72,413; (1901), 84,410. Previous to extension the municipal borough was coextensive with the parliamentary borough, which had an area of 6558 acres.

St Helier. See CHANNEL ISLANDS.

St Henri, incorporated city of Hochelaga county, Quebec, Canada, 2½ miles south-west of the centre of Montreal, on the north bank of the Lachine canal and on the Grand Trunk Railway. It contains municipal buildings, a college, and convent. The principal industrial establishments are sewing-machine, calico, shirt and collar, leather, confectionery, and rock-drill manufactories, rolling mill, tanneries, foundries, and one of the largest cotton mills in Canada. Population (1891), 13,413; (1901), 21,192.

St Hyacinthe, a city and port of entry of Quebec, Canada, and capital of St Hyacinthe county, 29 miles east-north-east of Montreal, on the left bank of the river Yamaska and on the Grand Trunk, Canadian Pacific, Intercolonial, and Quebec Southern railways. It is the seat of a Roman Catholic bishop, and contains a classical college, dairy school, a number of educational and charitable institutions, and two monasteries. It has manufactories of organs, leather, woollens, and agricultural implements. Population (1891), 7016; (1901), 9210.

St Ingbert, a town of Bavaria, Germany, in the Palatinate, 14 miles by rail west of Zweibrücken. It has coal-mines, iron-works, and manufacture of glass and machinery. Population (1885), 10,321; (1900), 14,048.

St Ives, a municipal borough and market-town in the St Ives parliamentary division of Cornwall, England, on St Ives Bay, 8 miles north-east of Penzance by rail. The works and property of St Ives harbour were in 1886 vested in the corporation. Modern buildings are a pier and a free library. The old stone pier has been repaired and lengthened. Area, 1019 acres. Population (1891), 6094; (1901), 6697.

St Johann, a town of Prussia, in the Rhine province. See SAARBRÜCKEN.

St John, the capital of St John county, New Brunswick, the largest city in the province, 275 miles from Halifax by the Intercolonial Railway, and 481 miles from Montreal by the Canadian Pacific Railway, of which it is the Atlantic terminus. In 1889 the cities of St John and Portland were united under one government. Through its direct connexion with Montreal and the West, St John has rapidly come into prominence as the winter port of Canada. The city expended about $750,000 in providing terminal facilities, in the shape of wharves, elevator, &c., on the west side of the harbour. The winter port trade opened in 1895–96, and has since steadily increased. Another large grain elevator has been constructed at the deep-water terminus of the Intercolonial Railway, where extensive wharf accommodation has also been provided by the Dominion Government, the two costing over $1,000,000. A large tract of forest land, including a beautiful sheet of water called Lily Lake, just north of the city, has been secured for a public park, the natural beauties of which are being constantly improved. It has the nucleus of a zoological garden. Through the munificence of one of its late citizens, St John has a home for incurables, $100,000 having been bequeathed for that purpose. The most important modern buildings are the Intercolonial Railway station, opera house, quarantine station, the market building, and high school, and a site has been selected for a Carnegie library. The geology and natural history of the province are well represented in the museum of the Natural History Society of New Brunswick, situated in the market building. This collection includes the specimens formerly in the mechanics' institute.

The city is governed by a mayor and fifteen aldermen, thirteen of whom represent separate wards and two the city at large, but each alderman is elected by the whole city. St John city and county return two members to the House of Commons, instead of three, as formerly. The following figures show the condition of the coasting trade in 1901:—Steamers and sailing vessels, arrived, 2620, tonnage 408,055, men 18,890; departed, 2790, tonnage 562,778, men 22,431. The number of steamers and sailing vessels entering from British and foreign ports was 1663 (668,227 tons); cleared, 1465 (478,613 tons). On the 31st December 1900 there were 399 sailing ships and steamers (net tonnage 61,072) on the registry books; of these, 68 were steamers, gross tonnage 7564. In 1900, 12 new vessels (410 tons) were built. In 1902 there were 153 schools, attended by 6947 pupils, 40 churches, 1 bank and 6 branch banks, and a good electric street railway. The city is lighted by gas and electric light. In 1880 the exports amounted to $3,249,718 and the imports to $3,197,568. In 1890, exports $3,595,877, imports $4,352,018; in 1901, exports $11,094,903, imports $4,623,134. Population (1881, including Portland), 41,353; (1901), 40,711.

St John, West Indies. See ST THOMAS.

St Johns, the capital of Newfoundland, situated on the east coast of the island, in 47° 33′ 54″ N. and 52° 40′ 18″ W., the seat of government and the chief seaport and place of trade in the colony. From all records St Johns may fairly claim the distinction of being the earliest English settlement in America. The

old city, built entirely of wood, was twice completely destroyed by the French, and twice (1816–17 and 1846) by fire. Half of the capital was again burnt down in 1892. From all these disasters and, worse than all, the bank crash of 1894, St Johns arose, better built and more prosperous than ever. The town is well drained and its sanitary arrangements are fairly good. The main street is admirably paved, and there is an electric railway of the most modern construction. The railway across the island to Port aux Basques has one terminus in the east end of the town; another in the western quarter, has a fine station, whence a branch line connects with the main line, about 7 miles west. The English cathedral, an admirable specimen of Gothic architecture, is not yet complete. Unfortunately part of the nave was burned, and the central tower is unfinished. The hotel accommodation is quite inadequate to the needs of the city. There are several good public halls. Education is purely denominational. The colleges for the higher education are modern buildings; and the council of higher education, formed of all the denominations, has worked well. St Johns is not an incorporated town. A municipal council was abolished after having increased the city debt to a million and a half dollars. The town is now governed by three commissioners appointed by the governor in council.

St Johns, with its narrow entrance and surrounding hills, is a great natural fortress, the Gibraltar of North America. As a naval base it would control the trade of the North Atlantic, which all passes within a short radius of Cape Race. Both in the war of the Revolution and in that of 1812 St Johns was the headquarters of the British fleet, and at one time the western end of the harbour was filled up with American prizes. The forts are all dismantled and in decay; but a very elaborate survey of St Johns and the surrounding country has been made by the naval officers on the station, with a view to the fortification and defence of the port. Steamship lines run to Liverpool, New York, Halifax, N.S., the north and west coasts of the island, and Labrador. Local steamers in connexion with the railway also run on Placentia, Trinity, Bonavista, and Notre Dame Bays. Out of 399,852 tons of British steam shipping entered in Newfoundland in the year ending 30th June 1900, St Johns represented 243,367 tons. The total tonnage of sailing vessels entering and clearing from the port was in the same year 88,731 tons. Ninety per cent. of all duties collected are paid in the capital. Up to the bank crash of 1894, there were only local banks; three Canadian banks have now established branches, and the financial condition of the city is to-day thoroughly sound. At the census of 1891 St Johns electoral district had 36,027, and the city 29,007 inhabitants. By the census of 1901 the electoral district contained 39,994 inhabitants, divided as regards religion as follows:—Church of England, 9566; Roman Catholic, 21,575; Methodists, 6737; Presbyterians, 1062; Congregationalists, 412; Salvation Army, 520; other denominations, 122. The population of the municipality was 30,486.

St Johns, a town and port of entry of Quebec, Canada, and capital of St Johns county, 19 miles south-east of Montreal by rail, on the bank of the river Richelieu and at the head of the Chambly canal. There are county buildings, head office of the St Johns Bank, silk works, drain-pipe and chinaware factories, potteries, &c. A large export trade in lumber, grain, and farm produce is carried on. Three railways, the Grand Trunk, Canadian Pacific, and Central Vermont, enter St Johns. Imports for the year 1900–01, $2,477,942, and exports, $2,709,172. Population (1891), 4722; (1901), 4030.

St Johnsbury, a town of Vermont, U.S.A., capital of Caledonia county. It is on the river Passumpsic, and on the St Johnsbury and Lake Champlain and the Boston and Maine railways, in the north-eastern part of the state, at an altitude of 572 feet. The principal village bears the same name as the town, and has some prominence as a manufacturing place. Population (1890) of the town, 6567; of the village, 3857; (1900) of the town, 7010; of the village, 5666, of whom 1309 were foreign-born.

St Joseph, a city of Michigan, U.S.A., capital of Berrien county. It is on Lake Michigan, at the mouth of the river St Joseph, and on the Vandalia and the Pere Marquette railways. Population (1890), 3733; (1900), 5155, of whom 1183 were foreign-born and 103 negroes.

St Joseph, a city of Missouri, U.S.A., capital of Buchanan county. It is situated in 39° 45′ N., 94° 53′ W., on the east bank of the river Missouri, in the north-western part of the state, at an altitude of 825 feet. The city is divided into nine wards, is supplied with water by pumping from the Missouri, is sewered, and its streets are paved with brick or macadamized. It is one of the most important railway points of the interior, since six railways enter the city, the Atchison, Topeka and Santa Fé, the Chicago, Burlington and Quincy, the Chicago Great Western, the Chicago, Rock Island and Pacific, the Missouri Pacific, and the St Joseph and Grand Island. These make it a commercial centre of the first importance, and to its immense traffic by rail is to be added that by the river. Its manufactures, though not of so great relative importance, are considerable. In 1900 there were 440 manufacturing establishments, with a total capital of $11,068,825; they employed 7429 hands, and their output was valued at $31,690,736. The chief items of production were slaughtering and meat-packing, valued at $19,009,332; clothing, $1,782,395; and bakery products, $1,327,470. In 1901 the assessed valuation of real and personal property was $23,588,380, the net debt of the city was $1,655,140, and the rate of taxation was $28·50 per $1000. Population (1890), 52,324; (1900), 102,979; showing an extremely rapid growth. Of the population in 1900, 8424 were foreign-born and 6260 negroes.

St Junien, a town, arrondissement of Rochechouart, department of Haute-Vienne, France, 18 miles in direct line west by north of Limoges, on the railway from Limoges to Angoulême, and on the right bank of the Vienne. The 12th-century church, a fine example of the Roman Limousin style, contains a richly sculptured tomb of St Junien, the 6th-century hermit, from whom the town takes its name; and adjacent to the church is a canonical refectory of the 13th century. Another interesting edifice is the Gothic chapel of Notre Dame, with three naves, rebuilt by Louis XI., standing close to an ancient bridge over the Vienne. The town, which ranks second in the department in population and industry, is noted for leather-dressing and the manufacture of gloves and straw paper; other considerable establishments are felt and clog works, and there are spinning, flour, and saw mills. Near the forest of Brigueil, 4 miles north-east of the town, are large porcelain works, one of the most important in the Limousin region. Population (1881), 5499; (1901), 11,432.

St Kitts, or St Christopher, forming, with Nevis and Anguilla, one of the presidencies of the colony of the Leeward Islands (British West Indies). The island is well watered, healthy, and fertile. The temperature varies from 67° to 89°. The rainfall for 1900 was 38·00 inches. The roads are good. Population (1881), 29,137; (1901), 29,782. Basseterre, the capital, has a population of about 10,000. Sugar-growing is the sole staple industry. Revenue of the presidency (1900), £39,904; expenditure, £43,964; public debt, £73,950. Primary education is by law compulsory. Most of the inhabitants are Protestants. The local legislative council of St Kitts-Nevis comprises ten official and ten unofficial members, all of whom are nominated by the representative of the Crown.

St Lawrence.—The river St Lawrence, in North America, with the five fresh-water inland seas—Lakes Ontario, Erie, Huron, Michigan, and Superior—that are linked to it, is one of the great river systems of the world. Its length, from the source of the river St Louis (which rises near the source of the river Mississippi and falls into the head of Lake Superior) to Cape Gaspé, where it empties into the Gulf of St Lawrence, is 2100 miles. From the head of Lake Superior the lakes are navigable to Buffalo, at the foot of Lake Erie, a distance of 1023 miles, for vessels having a draught of from 17 to 20 feet; from Buffalo to Montreal, 348 miles, the draught is limited by the capacity of the canals to 14 feet; from Montreal to Quebec, 160 miles, the ship channel accommodates vessels with a draught of $27\frac{1}{2}$ feet, rapidly being increased to 30 feet; below Quebec the river is navigable to vessels of any draught. The lakes, and the river to the point where it crosses the 45th parallel of north latitude in its north-easterly course, form the boundary-line between the Dominion of Canada on the north and the United States of America on the south; thence to the sea the river is wholly within Canadian territory.

The population of the states and provinces bordering on the St Lawrence system was estimated in 1899 to be 35,000,000. In Pennsylvania and Ohio, south of Lake Erie, there are large coal-fields. Surrounding Lake Michigan, and west of Lake Superior, are vast grain-growing plains, and the prairies of the Canadian North-West are rapidly increasing the area and quantity of wheat grown; while both north and south of Lake Superior are the most extensive iron mines in the world, from which $18\frac{1}{2}$ million tons of ore were shipped in 1899. The natural highway for the shipment of all these products is the Great Lakes, and over them coal is distributed westwards and grain and iron ore are concentrated eastwards. The great quantity of coarse freights, that could only be profitably carried long distances by water, has revolutionized the type of vessel used for its transportation, making large steamers imperative, driving out sailing and small steam vessels, consolidating interests, and cheapening methods. With every increase in available draught, larger ships have been built to take advantage of it, and now the bulk of the trade is done in steel steamers of large tonnage, many of which tow barges, also of large size. It is usual for the vessels in the grain trade and in the iron-ore trade to make their up trips empty; but in consequence of the admirable facilities provided at terminal points, they make very fast time, and carry freight very cheaply. The cost of freight per ton-mile fell from $\frac{23}{100}$ cent in 1887 to $\frac{8}{100}$ cent in 1898; in 1899 the rate rose again, because there were not sufficient vessels to handle the freight offered. The large shipping trade is assisted by both the United States and Canadian Governments by a system of aids to navigation that very carefully mark every channel and danger. In 1901 there were on the Great Lakes 437 United States and 191 Canadian lighthouses; and on the river and gulf, 184 Canadian lights, including 11 lightships; besides steam fog-alarms, gas and bell buoys, and buoys and beacons in great numbers. There are also life-saving stations at all dangerous points.

Duluth, at the head of Lake Superior, has rapidly developed into a harbour of great shipping capacity. Other large iron-ore shipping ports on Lake Superior are Ashland, Two Harbours, Marquette, Superior. Fort William, at the mouth of the river Kaministiquia, Thunder Bay, is important as the most westerly point at which the Canadian Pacific Railway strikes the St Lawrence system, and is the outlet for much of the wheat of the Canadian North-West. There are large elevators at this point, and a line of fine Tyne-built passenger steamers runs to Owen Sound. These, and a line of passenger steamers running between Buffalo and Duluth, are equal in accommodation to transatlantic liners.

The river St Mary, 55 miles long, is the only outlet of Lake Superior. From Point Iroquois, which may be considered the foot of the lake to Sault Ste Marie, St Mary's Falls, or St Mary's Rapids, as it is variously called, a distance of 14 miles, there is a single channel, which has been dredged by the United States Government to give a minimum width of 800 feet, and a depth of 23 feet at mean stage water. Below the Sault, the river, on its course to Lake Huron, expands into several lakes, and is divided by islands into numerous contracted passages. There are two navigated channels; the older one, following the international boundary-line by way of Lake George, has a width of 150 to 300 feet and depth of 17 feet; the other, some 12 miles shorter, an artificial channel dredged by the United States Government in their own territory, has a minimum width of 300 feet and depth of 20 feet.

Between Lake Superior and Lake Huron there is a fall of about 20 feet, of which the Sault, in a distance of half a mile, absorbs from 18 to $19\frac{1}{2}$ feet, the height varying as the lakes change in level. The enormous growth of inter-lake freight traffic has justified the construction of three separate locks, each overcoming the rapids by a single lift—two side by side on the United States, and one on the Canadian, side of the river. These locks, the largest in the world, are all open to Canadian and United States vessels alike, and are operated free from all taxes or tolls on shipping. The Canadian ship canal, opened to traffic on the 9th September 1895, was constructed through St Mary's island, on the north side of the rapids, by the Canadian Government, at a cost of $3,684,227, to facilitate traffic and to secure to Canadian vessels an entrance to Lake Superior without entering United States territory. The canal is 5967 feet long between the extremities of the entrance piers, has one lock 900 feet long, and 60 feet wide, with a depth on the sills at lowest known water-level of $20\frac{1}{4}$ feet. The approaches to the canal are dredged to 18 feet deep, and are well buoyed and lighted.[1]

On the United States side of the river the length of the canal is $1\frac{5}{8}$ miles, the channel outside the locks having a varying width of 108 to 600 feet, and depth of 25 feet. The locks of 1855 were closed in 1886, to give place to the Poe lock. The Weitzel lock, opened to navigation 1st September 1881, was built south of the old locks, the approach being through the old canal. Its chamber is 515 feet long between lock-gates, and 80 feet wide, narrowing to 60 feet at the gates. The length of masonry walls is 717 feet, height $39\frac{1}{2}$ feet, with 17 feet over mitre sills at mean stage of water.

The Poe lock, built because the Weitzel lock, large and fully equipped as it is, was insufficient for the rapidly-growing traffic, was opened on the 3rd August 1896; length between gates, 800 feet; width, 100 feet; length of masonry walls, 1100 feet; height, $43\frac{1}{2}$ to 45 feet, with 22 feet on mitre sills at mean stage of water.

The canals are closed every winter, the average date of opening up to 1893 being 1st May, and of closing 1st December. The pressure of business since that time, aided possibly by some slight climatic modification, has extended the season, so that the average date of opening is now ten days earlier, and of closing twelve days later. The earliest opening was in 1898, on 11th April, and the latest closing in 1899, on the 20th December. The following table gives the average yearly commerce for every five years since 1880, and serves to show the rapid increase in freight growth:—

*Statement of the Commerce through the several Sault Ste. Marie Canals, averaged for every Five Years.**

Years.	Passages.	Registered Tonnage.	Passengers.	Coal. Net Tons.	Flour. Barrels.	Wheat. Bushels.	Other Grains. Bushels.	General Merchandise. Net Tons.	Salt. Barrels.	Iron Ore. Net Tons.	Lumber. M. feet B.M.	Total Freight. Net Tons.

* Statistical Report of Lake Commerce passing through Canals, published annually by the U.S. Engineer officer in charge.

The outlet of Lake Michigan, which is the only lake lying wholly in United States territory, is near the point where the river St Mary reaches Lake Huron. The level of Chicago, above Lake Michigan, is so slight that much difficulty arose in draining it. A drainage canal has consequently been constructed, 34 miles long, to divert the river Chicago, a small stream which flowed into the lake, into the river Joliet, which flows into the Mississippi. Water was let into the drain in December 1899. The estimated flow through it is 10,000 cubic feet per second. It is proposed to utilize this drainage canal as a ship canal, to give the lakes a freight outlet into the Gulf of Mexico.

Lake Huron empties into Lake Erie through the river St Clair,

[1] Report of Department of Railways and Canals, 1899, pp. 10 and 31.

Lake St Clair, and the river Detroit. On these connecting waters are several important manufacturing and shipping towns, and through this chain passes nearly all the traffic of the lakes, both that to and from Lake Michigan ports, and also that of Lake Superior. It is estimated that the tonnage of a single short season of navigation exceeds in the aggregate 40,000,000 tons. Extensive dredging and embankment works have been carried on by the United States Government in Lake St Clair and the river Detroit, and a 20-feet channel now exists, which is being constantly improved.

The Grand Trunk Railway opened in 1891 a single-track tunnel under the river St Clair, from Sarnia to Port Huron, the only tunnel under the river St Lawrence. It is 6026 feet long, a cylinder 20 feet in diameter, lined with cast iron in flanged sections.

From Buffalo, at the foot of Lake Erie, the river Niagara runs northwards 36 miles into Lake Ontario. Niagara Falls are 23 miles below Buffalo. The river is spanned by five important railway and tramway bridges.

To overcome the difference of 327 feet in level between Lakes Erie and Ontario, the Welland canal, accommodating vessels of 255 feet in length, with a draught of 14 feet, was built, and is maintained, by Canada.

The Murray canal, opened for traffic on 14th April 1890, extends from Presqu'ile Bay, on the north shore of Lake Ontario, a distance of 6½ miles, to the headwaters of the Bay of Quinte, and enables vessels to avoid the open lake navigation. It is 11 feet deep below the lowest lake level, and has no locks.

Trent canal is a term applied to a series of water stretches in the interior of Ontario which are ultimately designed to connect Lake Huron with Lake Ontario. At Peterboro a hydraulic balance-lock, with a lift of 65 feet, 140 feet in length and 33 feet clear in width, allowing a draught of 8 feet, has been constructed. The ordinary locks are 134 by 33 feet, with a draught of 6 feet. When the whole route of 200 miles is completed, there will not be more than 15 miles of actual canal, the remaining portion of the waterway being through lakes and rivers.

The name St Lawrence is first applied to the river where it leaves Lake Ontario at Kingston. The canals on the St Lawrence have been enlarged to the capacity of the Welland and Lachine canals, the system having been opened to commerce in the autumn of 1899. Instead of enlarging the Beauharnois canal, on the south side of the river, a canal, the "Soulanges," was built from Coteau Landing to Cascades Point, on the north side, the Beauharnois canal still being utilized for small barges. The locks of all these canals are 45 feet wide, with an available depth of 14 feet and a minimum length of 270 feet. The following table shows the canalized stretches in this portion of the river:—

Name.	From	To	Length in Miles.	Number of Locks.	Rise in Feet.
Galops .	Head of Galops Rapids	Iroquois	7⅓	3	15½
River .	...	...	4	...	...

The river St Lawrence is spanned by the following railway bridges:—1. A truss bridge, built near Cornwall in 1900 by the New York and Ottawa Railroad. 2. A truss bridge with a swing, built in 1890 by the Canada Atlantic Railway at Coteau Landing. 3. A cantilever bridge, built in 1887 by the Canadian Pacific Railway at Caughnawaga. 4. The Victoria Jubilee bridge, built as a tubular bridge by the Grand Trunk Railway in 1860, and transformed into a truss bridge in 1897–98. The new bridge rests on the piers of the old one, enlarged to receive it, is 6592 feet long by 67 feet wide, with 25 spans, has double tracks, trolley tracks, driveways, and sidewalks, and was erected without interruption of traffic. Between Quebec and Montreal the ship channel, begun by the Montreal Harbour Commissioners, has been assumed by the Government as a national work.

The river St Lawrence is the shortest freight route from the Great Lakes to Europe. From Buffalo to Liverpool *viâ* New York involves rail or 7-foot canal transport of 496 miles and an ocean voyage of 3034 nautical miles. *Viâ* Montreal, there is 14-foot canal transport of 348 miles and river and ocean voyage in transatlantic ships of 2772 nautical miles. From Quebec to Liverpool by Cape Race is 2801 nautical miles, while the route by Belle Isle, more nearly a great circle course, usually taken between July and October, is only 2633 nautical miles. The St Lawrence route suffers in competition with more southerly routes in consequence of not being open throughout the year. The Great Lakes never freeze over completely, but the harbours, and often the connecting rivers, are closed by ice. The navigable season at the Sault is about 7½ months; on Lake Erie it is somewhat longer. The average time between the arrival of the first vessel at Montreal from sea and the departure of the last ocean vessel is seven months. From Kingston to Quebec the river freezes over every winter, except at points where the current is rapid. Below Quebec, although there is heavy border ice, the river never freezes over. For a few winters, while the bridge accommodation at Montreal was restricted to the old single track Victoria bridge, railway freight trains were run across the ice bridge on temporary winter tracks.

Efforts have been made to lengthen the season of navigation by using specially constructed steamers to break ice; and it is claimed that the season of navigation could be materially lengthened, and winter floods prevented, by keeping the river open up to Montreal. Car ferries run through the winter across Lake Michigan and the strait of Mackinac, across the rivers St Clair and Detroit, and across the middle of Lake Erie. The largest of these steamers is 350 feet long by 56 feet wide, draught 14 feet, horse-power 3500, speed 13 knots. She carries on four tracks 30 freight cars, with 1350 tons of freight.[1] Winter ferries are maintained at Quebec, between Prince Edward Island and Nova Scotia, and between Newfoundland and Sydney, Cape Breton. In the winter of 1898–99 an attempt was made to run a winter steamer from Paspebiac to England, but was not successful, principally because an unsuitable vessel was used. To pass through the field ice that is always present in the gulf, in greater or lesser quantity, specially strengthened vessels are required.

The river St Lawrence above tide water is not subject to excessive flooding, the maximum rise in the spring and early summer months, chiefly from northern tributaries from the Ottawa eastwards, being 10 feet. The Great Lakes serve as impounding reservoirs for the gradual distribution of all overflows in the west. At Montreal, soon after the river freezes over each winter, there is a local rise of about 10 feet in the level of the water in the harbour, caused by restriction of the channel by anchor ice; and in the spring of the year, when the volume of water is augmented, this obstruction leads to a farther rise, in 1886 reaching a height of 27 feet above ordinary low water. To prevent flooding of the lower parts of the city a dyke was in 1887 built along the river front, which prevented a serious flood in 1899.

The level of the lakes varies very gradually, and is affected by the general character of the season, and not by individual rainfalls. The variations of level of the several lakes do not necessarily synchronize. There is an annual fluctuation of about 1 foot in the upper lakes, and in some seasons over 2 feet in the lower lakes; the lowest point being at the end of winter and the highest in midsummer. In Lake Michigan the level has ranged from a maximum in the years 1859, 1876, and 1886, to a minimum, nearly 5 feet lower, in 1896.[2] In Lake Ontario there is a range of 5½ feet between the maximum of May 1870 and the minimum of November 1895. In consequence of the shallowness of Lake Erie, its level is seriously disturbed by a persistent storm; a westerly gale lowers the water at its upper end exceptionally as much as 7 feet, seriously interfering with the navigation of the river Detroit, while an easterly blow produces a similar effect at Buffalo. There is geological evidence to show that the whole basin of the lakes has in recent geological times gradually changed in level, rising to the north and subsiding southwards; and it is claimed that the movement is still in gradual progress, the rate assigned being ·42 foot per 100 miles per century.[3]

The maintenance of the levels of the Great Lakes is a matter of vital importance to the large freight boats, which always load to the limit of depth, at critical points in the dredged channels or in the harbours. Fears have been entertained that the water-power canals at Sault Ste Marie, the drainage canal at Chicago, and the dredged channel in the river Detroit will permanently lower the levels respectively of Lake Superior and of the Michigan–Huron–Erie group. An international deep-waterway commission considered this question, and army engineers appointed by the United States

Government worked on the problem.[1] Wing dams in the rivers St Mary and Niagara, to retard the discharges, were proposed as remedial measures.

The Great Lakes are practically tideless, though some observers claim to find true tidal pulsations, said to amount to 3½ inches at spring tide at Chicago. Secondary undulations of a few minutes in period, ranging from 1 to 4 inches, are well marked. Tides enter the Gulf of St Lawrence from the Atlantic chiefly through Cabot Strait (between Cape Breton and Newfoundland), which has a width of 75 miles and a depth of 250 fathoms. The tide entering through Belle Isle Strait, 10 miles wide and 30 fathoms deep, is comparatively little felt. The tidal undulation, in passing through the gulf, expands so widely as to be almost inappreciable in places, as, for example, at the Magdalen Islands, in the middle of the gulf, where the range amounts to about 3 feet at springs, becoming effaced at neaps. There is also little more tide than this at some points on the north shore of Prince Edward Island. The greatest range is attained locally in Northumberland Strait and in Chaleur Bay, where it amounts to 10 feet. At the entrance to the estuary of the river St Lawrence, at Anticosti, it has again the oceanic range of about 6 feet, and proceeds up the estuary with an ever-increasing range, which attains its maximum of 19 feet at the lower end of Orleans Island, distant 650 miles from the ocean at Cabot Strait. This must be considered as the true head of the estuary. At Quebec, 30 miles farther up, the range is nearly as great; but at 40 miles above Quebec it is largely cut off by the Richelieu Rapids, and finally ceases to be felt at Three Rivers, at the lower end of Lake St Peter, 760 miles from the ocean.

The St Lawrence system is rich in water-powers, which are being increasingly utilized, and promise to add greatly to the resources of both countries. The river at Sault Ste Marie has been diverted into power canals on both sides, and furnishes electric light, traction, and power to both towns, and operates a very large pulp mill. The Niagara at the Falls is led through tunnels on both sides of the gorge, and electricity at a very high voltage is supplied to Buffalo, 22 miles distant, as well as being used locally. The St Lawrence Rapids have long been utilized for milling and factory purposes; a wing dam on the north side of the Lachine Rapids furnishes electricity to Montreal; the Falls of Montmorency light Quebec and run her street cars; and from Lake Superior to the gulf there are numerous water-powers on tributaries to the St Lawrence, only awaiting population and capital for profitable development.

The Great Lakes are well stocked with fish of commercial value. These are largely gathered from the fishermen by steam tenders, and taken fresh or in a frozen condition to railway distributing-points. In Lakes Superior and Huron salmon-trout (*Salvelinus namaycush*, Walb) are commercially most important. They ordinarily range from 10 to 50 ℔ in weight, and are often larger. In Georgian Bay the catches of whitefish (*Coregonus clupeiformis*, Mitchill) are enormous. In Lake Erie whitefish, lesser whitefish, erroneously called lake-herring (*C. artedi*, Le Sueur), and sturgeon (*Acipenser rubicundus*, Le Sueur) are the most common. There is good angling at numerous points on the lakes and their feeders. The river Nepigon, on the north shore of Lake Superior, is famous as a stream abounding in speckled trout (*Salvelinus fontinalis*, Mitchill) of unusual size. Black bass (*Micropterus*) are found from Georgian Bay to Montreal, and the Maskinongé (*Esox nobilior*, Le Sueur), plentiful in the same waters, is a very game fish that often attains a weight of 70 ℔. Nearly all the rivers flowing into the St Lawrence below Quebec are stocked with salmon (*Salmo salar*), and are preserved and leased to anglers by the provincial government. In the salt water of the gulf and lower river, mackerel, cod, herring, smelt, sea-trout, striped bass, and other fish are caught for market. (W. P. A.)

St Leonards, a parish of Sussex, England, on the south coast, included in the municipal borough of Hastings. Population (1881), 7165; (1891), 10,283; (1901), 26,872. (See HASTINGS.)

St Louis, the most important city in the state of Missouri and the 4th in size in the United States, situated on the right, or west, bank of the river Mississippi, about 20 miles below its junction with the Missouri, in 38° 38′ 3–6″ N. and 90° 12′ 17″ W. It has an area of 62½ square miles and a river front of 19 miles. Twenty lines of railway have their terminus in the Union station, which covers 11 acres and was opened in September 1894. The cost of the station, including the site, was $6,500,000. The lines from the east cross the Mississippi by Eads Bridge, which was opened for traffic 4th July 1874, and also by Merchants' Bridge, 3 miles above the former, which was finished in 1890 and is controlled by the Terminal Railway Company. An Act of the legislature, passed in 1899, authorized the consolidation of nearly all the rapid transit lines within the city. A single company owns and controls 361 miles of single track, and runs about 2000 cars. By a system of transfers, passengers can go from almost any point in the city to another upon payment of one fare. The suburban system owns 100 miles of single track, and its equipment includes 200 cars.

Population.—The population in 1890, not including any suburban locality, was 451,770, an increase of 28·89 per cent. over that of 1880. In 1900 it was 575,238, an increase of 27·33 per cent. over that of 1890. In 1900 the foreign-born population numbered 111,356, and the native white population born of foreign parents was 239,170. The total number of negroes, or persons of negro descent, was 35,516. The death-rate by the census of 1890 was 17·4. In 1900 it was 17·9, being nearly 90 per cent. higher among the coloured than among the white population. The birth-rate by the census of 1890 was 26·46 per 1000 for white persons and 26·36 for coloured persons.

Education, Libraries, &c.—The number of public schools in 1901 was 188; the number of teachers, 1751; the number of pupils, 82,712. The total amount expended for school purposes in 1899 was $1,888,670.22, and the estimated value of all public school property, including that held for investment, was $6,803,704. During the year 1899 and the spring of 1900 Washington University, an endowed non-sectarian institution, increased its endowment fund by more than $4,000,000, and began preparations for removal to a new site comprising 150 acres on the outskirts of the city. The land, which cost about $350,000, the fund for the new buildings, amounting to $750,000, and the increased endowment, were the gifts of citizens of St Louis. The St Louis University, belonging to the Roman Catholic order of Jesuits, occupies large and commodious buildings in the city, and is one of the most important institutions of learning controlled by that religious body in the United States.

St Louis has a large number of clubs for social and business purposes, chief among which are the St Louis, the University, the Mercantile, the Noonday, the Union, the Commercial, and the Round Table. The Mercantile library contains upwards of 112,000 volumes. The public library contains 135,000 volumes.

Municipal Affairs, Taxation, &c.—The bonded debt at the end of the fiscal year 1900–1901 amounted to $18,916,278. The annual interest charges on the debt outstanding 10th April 1899 amounted to $802,209, or an average of 4·367 per cent. per annum. The resources of the sinking fund for the fiscal year 1898–99 amounted to $361,783, and this money was used in returning to the treasury the sum advanced during the year 1897–98, and in the redemption of bonds maturing during the year 1898–99. The assessed valuation of property for the taxes of 1901 was $394,722,700, not including the street railway property, the assessment on which is made by the state board of equalization. The rate of taxation on the $100 valuation of property for 1901 for municipal purposes was $1.90. In 1887 the city council authorized the extension of the water-works system, and established a low-service station at the Chain of Rocks, several miles above the former station. This work was put into operation during 1894. Since that time an extension of the high-service pumping plant has been authorized, and plans are on foot for a plant to filter all water before it is delivered. The extended works are able to furnish 100 million gallons of water a day.

Commerce and Manufactures.—Foreign shipments of flour and grain by rail and river on through bills of lading during the year 1901 were: of flour, 2,961,563 barrels; of wheat, 16,922,890 bushels; of corn, 14,942,915 bushels; of oats, 6,219,540 bushels; cotton, 973,837 bales. The total value of the gross receipts of

[1] Report of the Chief of Engineers U.S. Army in Report of War Department U.S., 1898, p. 3776.

cotton for 1901 was about $40,000,000. Among other receipts for 1901 were: lumber and logs, 824,201,000 feet; wool, 25,877,110 ℔; sugar, 253 hhds., 465,246 barrels, 534,576 bags; coal, 4,407,890 tons; butter, 13,476,929 ℔. The total number of tons of freight of all kinds received and shipped was 28,758,664. St Louis produces more than three-fourths of all the manufactures of the state of Missouri. The estimated product of the manufactures of St Louis for 1901 is valued at $340,000,000, of which the following are the chief: tobacco, 80,766,883 ℔; flour, 1,505,234 barrels; furniture of the value of about $33,000,000. Boots and shoes have been sold valued at $43,500,000; bagging, 12,500,000 yards.

Banking.—The number of banks in St Louis has been reduced by consolidation from twenty-five in 1896 to nineteen in 1901; the total capital has, however, been increased. There are eight trust companies. In 1901 the bank deposits increased to $788,801,986, and those in the trust companies increased to $19,016,293. The total capital of the nineteen banks in December 1901 was $30,059,963, and of the trust companies, $29,278,007. The dividends paid by both banks and trust companies in 1901 amounted to $2,604,000, an increase of $619,000 over those of 1900. The clearings for 1901 exceeded those of any previous year by $562,830,722, aggregating $2,270,680,216. The balances for the year 1898 were $182,014,792, and for 1899, $214,166,941.

Political Parties.—The city several years gave a decided majority to the candidates of the Republican party in municipal, state, and Federal elections, although the state of Missouri was Democratic by a large majority for many years. The city, however, gave a majority to the candidates of the Democratic party in 1901. The vote for Presidential electors in 1896 was as follows: for Republican electors, 65,708; for Democratic electors, 50,091; in 1900, for Republican electors, 60,597; for Democratic electors, 59,931. In the election of a state supreme judge in 1898 the vote was as follows: for the Republican candidate, 48,900; for the Democratic candidate, 39,697.

AUTHORITIES.—*Encyclopædia of the History of St Louis*, a compendium of history and biography, in four volumes, published in 1899. A Blue Book is published yearly by the Merchants' Exchange, compiled by its secretary, dealing with the business progress of the year. (M. S. S.)

St Lucia, the largest of the British Windward Islands, West Indies. Population (1891), 42,220; (1901), 49,895. Of these, a small percentage are of European descent, but the majority are negroes, with about 2000 East Indian coolies. The death-rate is about 22·50 per 1000. The dangers from venomous reptiles have been exaggerated. Only one death from snake-bite was recorded in 1898, none in 1900; and snakes are now but rarely met with.

The climate is humid; the rainfall varying from 70 to 120 inches per annum, with a very uniform average temperature of about 80° F. In 1899 the highest temperature was 91° (in May) and the lowest 68° (in December). Great damage was done on 11th September 1898 by a hurricane and the accompanying rains—steep hillsides, surcharged with water, slid away in all directions, carrying with them plantations, houses, roads, and bridges, and leaving rocks and rubbish behind. Castries, the capital (with a population of about 7900), by reason of its harbour, wharfage, and coaling facilities, is the second naval station and one of the most important shipping ports in the British West Indies. It is strongly fortified, and is the chief coaling station of the fleet in the West Indies. It is in telephonic communication with seven small towns or villages. Crown lands occupy about one-half of the island. Amongst the principal products are sugar, cacao, logwood, coffee, nutmegs and mace, kola nuts, and vanilla. Tobacco is grown, but not for export. The imports of 1900 were valued at £403,592, largely owing to increased importation of military stores, the total of 1899 having been only £282,693; the exports at £229,436, of which £55,561 was for sugar. Revenue (1900), £72,107; expenditure, £64,750; public debt in 1901, £176,680. In 1900, at Castries, 1240 steam vessels and 617 sailing vessels entered and cleared, giving a total tonnage of 1,841,593, of which 82 per cent. was British. Of the total trade values in 1900, the United Kingdom sent 55 per cent. of the imports and the United States 31 per cent.; while the former took 26 per cent. of the exports, but the United States 71 per cent.

In 1900 there were 42 state-aided elementary schools under the control of the Roman Catholics, to whom were handed over all the Government schools in 1898. The number of children on the roll in 1900 was 6365, and the amount spent on primary education was £3138. There are also a grammar school for boys and a high school for girls. The military expenditure for 1898 was £54,385. There is a police force numbering 59, with a rural constabulary of 100. Knowledge of the English language is increasing amongst the country people, who formerly spoke a French patois, the result of frequent French occupation of the island.

St Malo, chief town of arrondissement, department Ille-et-Vilaine, France, 43 miles north-north-west of Rennes, with terminal station on the railway from Rennes. Shipbuilding, engineering, and iron and copper founding are the most important industries. The harbour, including the contiguous and connected basins belonging more especially to St Servan, comprises an outer basin, a tidal harbour, two wet docks, and an inner reservoir, affording a total length of quayage of over two miles. The inner harbours have a minimum depth of 18 feet, but in the tidal harbours the depth at low water is *nil*. The number of vessels entered in 1900 was 784, of 208,080 tons; cleared 791, of 217,083 tons. Nearly all the trade is with England. The total port movement, including coasting trade, was 509,051 tons; 37 vessels with 824 men were engaged in the cod fishery. The number of passengers arriving by regular lines of vessels in 1900 was 10,271, and of departures, 9530. Population (1881), 9432; (1901), 11,486. The trade and industries of St Servan are of the same nature as those of St Malo, but are on a much smaller scale. Population (1881), 9583; (1901), 12,597.

St Marys, a village of Auglaize county, Ohio, U.S.A. It is on the Lake Erie and Western Railroad, and on the Miami and Erie canal, in the western part of the state. Population (1890), 3000; (1900), 5359, of whom 246 were foreign-born.

St Michael, Alaska Territory, formerly Redoubt St Michael, a settlement on an island of the same name, founded by Tebenkoff in 1833, is situated at the southern end of Norton Sound in 63° 28′ N. and 162° 05′ W. Since the discovery of gold on the Yukon, this place has been garrisoned by the United States army, and forms the centre of a military reservation with a radius of 100 miles. The island is low, volcanic, and covered with herbage. It derives its importance from the fact that it is the only port for Yukon commerce. This is carried on through a channel called the Uphoon, available for light draught vessels, behind the bar of the main river. It has a population of about 400 Eskimo natives, and a variable number of whites, which at times has amounted to several thousands. Thirty-five river steamers in 1899 were engaged in the river traffic from this place, and the commerce amounted to several millions of dollars. Navigation opens in June and closes in September. The annual mean temperature is 26·6° F. and the rainfall about 12 inches. The discovery of rich gold fields at Cape Nome, on the north shore of the Sound, attracted a temporary population estimated at 5000. The permanent population was reported by the United States census of 1900 as 857; in 1890 it was 101.

St Nazaire, chief town of arrondissement, department of Loire-Inférieure, France, 37 miles west of Nantes by rail. The parish church was completed in 1891. The Institut Verneuil established at La Baule is an

important sanatorium. The shipbuilding yards of the Transatlantic and Loire Companies, where are built large ships for the navy as well as for the mercantile marine, employ about 2500 men. Three dry docks are leased from the French Government. Forges, at a little distance from the town, employ 1600 men, and turn out large quantities of steel rails, sheet and bar iron, &c. There are also several large flour-mills and steam saw-mills. Great improvements have been effected in the port. A channel was dredged at the mouth of the river in 1892–93, sufficient to admit the passage of battleships. The old basin was considerably deepened, and has a depth on sill, high spring tides, of 30½ feet; an entrance with a minimum depth of 16 feet affords direct access from the roads to the old dock. There is regular communication with Newhaven. In 1900, including coasting trade, 807 vessels of 776,059 tons entered, and 832 of 786,403 tons cleared. The total port traffic, including coasting trade, amounted to 1,930,980 tons. The value of the imports was £2,608,000, and of the exports £3,488,000. The principal exports are woollen fabrics, wines and spirits, fruits, vegetables, sardines, silk goods, poultry, &c., and coffee. Foreign trade is chiefly with England, and the import of coal from Great Britain exceeded 1,000,000 tons. There are several stations much visited by the English and Americans for sea-bathing and as health resorts, especially La Baule and St Marguérite. The air in this district is noted as remarkably health-giving. At Fort de Lève are subterranean batteries. Population (1881), 15,843; (1901), 35,813.

St Omer, chief town of arrondissement, department of Pas-de-Calais, France, 42 miles north-west of Arras, on the railway from Paris to Calais. The fortifications have been demolished, making way for important alterations and improvements begun in 1892. Population (1881), 17,404; (1901), 20,867.

Sainton, Prosper Philippe Catherine (1813–1890), French violinist, was the son of a merchant at Toulouse, where he was born 5th June 1813, and educated at the college of his native town. He entered the Paris Conservatoire under Habeneck in 1831, and after gaining various prizes and undertaking a successful tour, became professor of the violin in the Conservatoire of Toulouse. In 1844 he made his first appearance in England, at a Philharmonic concert directed by Mendelssohn, and settled in London in the following year, in the course of which he was appointed professor at the Royal Academy of Music. In the early organizations for chamber music which culminated in the establishment of the Popular concerts, Sainton bore an important part; and when the Royal Italian Opera was started at Covent Garden, he led the orchestra under Costa, with whom he migrated to Her Majesty's Theatre in 1871. From 1848 to 1855 he was leader of the Queen's Band, and in 1862 he conducted the music at the opening of the International Exhibition. Two years before this, in 1860, he had married the famous contralto singer, Miss Charlotte Dolby. He was leader of the principal provincial festivals for many years, and gave a farewell concert at the Albert Hall in 1883, dying on 17th October 1890. His method was sound, his style artistic, and his educational work of great value, the majority of the most successful orchestral violinists having been his pupils. (J. A. F. M.)

Sainton-Dolby, Charlotte Helen (1821–1885), English contralto singer, was born in London 17th May 1821, studied at the Royal Academy of Music from 1832 to 1837, Crivelli being her principal singing-master. In 1837 she was elected to a king's scholarship, and first appeared at a Philharmonic concert in 1841. In October 1845 she sang at the Gewandhaus, Leipzig, through the influence of Mendelssohn, who had been delighted by her singing in *St Paul*. The contralto music in his *Elijah* was written for her voice, but she did not appear in that work till the performance at Exeter Hall on 16th April 1847. She married M. Sainton in 1860, and in 1870 she retired from the career of a public singer, but two years afterwards started a "vocal academy" in London. She made various successful attempts as a composer, and the cantatas "The Legend of St Dorothea" (1876), "The Story of the Faithful Soul" (1879), and "Florimel" (1885), enjoyed considerable success. Her last public appearance was at her husband's farewell concert in June 1883, and she died 18th February 1885. A scholarship in her memory was founded at the Royal Academy of Music. Her voice was of moderate power and of fine quality, but it was her dignified and artistic style that gave her the high place she held for so many years both in oratorio and ballads.

(J. A. F. M.)

St Ouen, town in the department of Seine, France, 1 mile north of the fortifications of Paris. Besides other important industries, it has manufactures of firearms (military and sporting), tinned foods, indiarubber goods, perfumery, soap, blacking, varnish, printers' ink, with glass works, sugar and saw mills, and distilleries. Population (1901), 35,351.

St Paul, one of the "twin" cities of Minnesota, U.S.A., situated in 44° 52′ 46″ N. and 93° 5′ W., on the river Mississippi. With Minneapolis it constitutes the centre of the commercial life of the North-West. The population in 1895 was 140,292; in 1900 it was 163,632, of whom 46,819 were foreign-born, and 2263 were negroes. Out of 51,027 adult males, 1351 were illiterate (unable to write), of whom 1225 were foreign-born. The birth-rate was 14·80 and the death-rate (1900) only 9·7 per thousand. The public school system has 49 buildings and employs 534 teachers. Pupils enrolled in 1899 numbered 24,344. The other educational institutions are enumerated in the article on MINNEAPOLIS. St Paul has 167 churches, a public library of 47,000 volumes, 29 parks aggregating 560 acres, not including New Phalen Park of 600 acres, and many miles of boulevards, and 103 miles of electric and cable street railways. Fifty-six newspapers and periodicals are published. There are 5 national banks, 8 state banks, 4 savings banks, and 13 trust companies. The aggregate capital of these institutions is $5,559,000. St Paul is distinctively a commercial city; its jobbing interests in 1898 did a business amounting to $168,000,000. It possesses the largest boot and shoe and clothing manufactures in the west. According to the United States census of 1900, there were in St Paul 1591 manufacturing concerns. The capital invested amounted to $28,208,389, the number of persons employed was 17,593, and the product $38,541,030. St Paul is the head of navigation on the Mississippi; but the channel will be extended to Minneapolis by dams and locks. The assessed valuation of real and personal property in 1900 was $86,637,646. The tax upon this amount was 22·40 mills on the dollar. A total debt of $8,404,035 rests upon the city, but a considerable part of this amount consists of water bonds issued to build a water-works system. The city government is what is called the board type. The cost of maintenance is about $2,150,000 each year. (F. L. McV.)

St Peter Port. See CHANNEL ISLANDS.

St Petersburg, a government of north-western Russia, at the head of the Gulf of Finland, stretching for

130 miles along its south-east shore and the southern shore of Lake Ladoga, and bordering on Finland, with an area of 20,760 square miles. It is hilly on the Finland border, but flat and marshy elsewhere, with the exception of a small plateau in the south (Duderhof Hills), which rises only from 300 to 550 feet. It has a damp and cold climate, the average temperatures being: at St Petersburg, for the year 39° F., for January 15°, for July 64°; yearly rainfall, 18·7 inches; at Sermaksa (60° 28′ N.), for the year 37°, for January 13°, for July 62°; yearly rainfall, 20·8 inches. The population, which was 635,780 in 1882, numbered 873,043 (census population, domiciled only) in 1897, without the capital and its suburbs. Of this latter number 466,750 were women and 160,499 lived in towns. The average density was 122 per square mile. The population is chiefly composed of Russians, with a small admixture of Finns and Germans, and according to religion it is distributed as follows: Greek Orthodox, 78 per cent.; Nonconformists, 1·6 per cent.; Lutherans, 17 per cent.; Roman Catholics, 2·4 per cent.; "others," 1 per cent. A remarkable feature is the very slow natural increase of the population. Up to 1884 there was even an excess of deaths, and it is only since 1886 that a small yearly excess (4922) of births over deaths has been noticed; thus during the 25 years 1867 to 1891 the natural increase of the population was only 867. This is easily explained, however, by the fact that large numbers of both men and women (especially young girls) are continually moving into the capital. The Government is divided into eight districts, the administrative headquarters of which are: St Petersburg (see below), Gdov (2254 inhabitants), Luga (5687), Novaya Ladoga (4144), Peterhoff (1130), Schlüsselburg (5285), Tsarkoye Selo (23,353), and Yamburg (4166). The other towns are: Gatchina (14,735), Narva (16,577), Oranienbaum (5333), Pavlovsk (4949), Okhta, Kolpino (12,030), Pulkova, and Krasnoye Selo. Most of the towns are summer resorts for the population of the capital. Till the latter part of the 19th century education stood at a very low level, but progress has since been made, and now three-quarters of all who enter the army from the province can read. There were in 1898, 875 primary schools, with 45,500 pupils, which means that more than one-half of all children of school age went to school. The local *zemstvo* (council) has also organized village libraries and lectures on a wide scale. Many improvements have been made, especially since 1897, in the sanitary organization of the province. The *zemstvo* maintains 144 hospitals and dispensaries, with 626 beds, 64 doctors, 144 assistants, and 41 midwives. Out of an area of 10,806,000 acres (still excluding the capital and suburbs), 29 per cent. was owned by the village communities in 1896, and 8 per cent. by the peasants, the remainder being private property, distributed as follows: nobles, 31 per cent.; merchant class, 9 per cent.; Imperial domains, 3 per cent.; members of the Imperial family in private, 3 per cent.; State, 9 per cent.; artisans, &c., 8 per cent. Generally speaking, agriculture stands at a low ebb. There were in 1898, 590,000 acres under cereals (rye, oats, and barley), 43,000 acres under potatoes, and 30,000 acres under green crops, the total area under cultivation being 972,000 acres. The average yield in 1895–99 was: rye 1,941,300 cwt., wheat 17,000 cwt., oats 1,553,000 cwt., barley 386,800 cwt., potatoes 4,400,000 cwt. These crops, which are often ruined by heavy rains in the late summer, are insufficient for the population, which has to live on imported grain. Flax is cultivated to some extent. There were in 1898, 132,500 horses, 192,700 horned cattle, 106,900 sheep, and 22,400 pigs. Dairy-farming is developing. Timber, shipping, quarrying, and fishing are important industries; and the chief factories are paper mills, chemical works, and printing works, but the aggregate returns of all factories amount only to 16,000,000 roubles per annum.

St Petersburg, the capital of the Russian empire, situated at the head of the Gulf of Finland, at the mouth of the Neva, in 59° 56′ N. and 30° 40′ E. It was formerly generally believed that in consequence of the gradual upheaval of land in the Gulf of Finland there would be no more inundations such as occurred in the 18th century and early in the 19th century. There has, indeed, been no very disastrous inundation since that of 1824, but in 1890, 1897, and 1898 the waters of the Neva rose over 8 feet, whereas a rise of 4 feet is sufficient to flood the lower parts of the city, and in the terrible year of 1824 the rise was 14 feet. Consequently, the question whether it would not be advisable to protect the whole of the capital by means of dams has again been raised, and is being seriously considered. Being still partly built of wood, St Petersburg continues to suffer a great deal from fire, the average yearly loss being estimated at from 2,000,000 to 3,000,000 roubles. Electricity is in fair progress, but half of the city continues to have only paraffin oil lamps in the streets. A great number of handsome buildings and wide new streets have been built, and various monuments have been erected to the best Russian writers.

The population of St. Petersburg proper at the five censuses specified was as follows:—

Year.	Total.	Men.	Women.	Proportion of Men to every 100 Women.
1864 .	539,122	313,443	225,679	139
1869 .	667,207	377,380	289,827	130
1881 .	861,303	473,229	388,074	122
1890 .	954,400	512,718	441,682	116
1897 .	1,132,677	616,855	515,822	119

A further increase was revealed by the municipal census of 26th December 1900, when the population of the city was 1,248,739, having thus increased 39·3 per cent. in ten years. The population of the suburbs was 134,710 in 1897, and in 1900, 190,635. Taken with its suburbs, St Petersburg is the 5th city of Europe in point of size, coming after London, Paris, Berlin, and Vienna. The large proportion of men in its population is due to the fact that great numbers come from other parts of Russia to work during the winter in the textile factories, and during the summer at unloading the boats. The consequence of this periodical inflow is that though among children up to 10 years of age the female population is the more numerous (only 97 boys to each 100 girls), among those from 10 to 20 years old the proportion is reversed, and becomes 152 men to each 100 women, while among those aged from 20 to 40 years it is 134 men to each 100 women. After that age the proportion of males rapidly decreases, being only 89 men to each 100 women among those of from 40 to 60 years old. The proportion of strangers to those who are born at St Petersburg itself is as 2 to 1; in 1897 the population included 135,717 males and 168,013 females, total 303,730, born at St Petersburg, while the number of persons born elsewhere was 377,001 males and 273,669 females, total 650,670. The influence of the influx of adult people is seen in this connexion also, for among children the proportion of strangers is only from one-eighth to one-fourth, while among those from 21 to 55 years of age it is as 4 and even 5 to 1. The peasants form more than half the population; and this proportion is likely to increase, for in 1869 they formed only 32 per cent. of the population, in 1881 42 per cent., in 1890 50 per cent., and in 1897, all told, 58 per cent. The census of 1890 also showed that more than one-half of the population (56 per cent.) was engaged in industries and trade, 16 per cent. in the service of the State, State and other companies, and the liberal professions, and 14 per cent. in domestic service, while 7 per cent. received their income from rents and pensions, and 7 per cent. had no definite occupation. The predominance of adult workers is again shown by the very small proportion (338 per thousand) of persons supported by the incomes of others. Russians numbered 828,354 in 1897, or 87 per cent. of the population; Germans 43,798, or 4·6 per cent.; Poles 22,307, or 2·3 per cent.; Finns 16,731, or 1·8 per cent.; and Jews

10,353, or 1 per cent. Of the remainder, the subjects of foreign nations are chiefly Germans, French, English (1881), Austrians, and Swedes. The number of marriages is very low, being only six per thousand in the years 1894–98, births numbered 29 per thousand, and deaths 25·2. The proportion of illegitimate children is nine times higher than in the rest of Russia, namely, from 250 to 286 per thousand births. It is thus nearly the same as in Paris, but lower than in Moscow (292 per thousand) and Vienna (349 per thousand). Out of each thousand women, 424 had their first child illegitimate. The mortality varies very much in the different parts of the city—from 12 per thousand in the best situated, the Admiralty quarter, to 16 in other central parts, and to 25 and 27 in the outlying quarters. It may be stated, however, that the mortality has notably decreased, as it averaged 36 per thousand in the years 1870 to 1874, and only 27 from 1886 to 1895, and 24 in 1897. Infectious diseases, *i.e.*, tuberculosis, diphtheria, inflammation of the lungs, typhoid, scarlet fever, and measles, are the cause of from 37 to 38 per cent. of all deaths. Disorders of digestion come next, various forms of cholerine, and even cholera itself, being endemic in St Petersburg. The high mortality in certain quarters is largely due to overcrowding and bad water. According to the census of 1890, there were in St Petersburg 142,523 separate sets of apartments, with 315,537 rooms, exclusive of kitchens and halls. This number is evidently quite insufficient; and although nearly 500 large stone houses and 500 wooden houses are added every year, the rents run very high, while nearly 50,000 persons live in underground rooms—most insanitary on account of the low ground upon which the city is built. The city is supplied with water from the Neva, which early analyses appeared to show was quite pure. From analyses made in 1893–98, however, it would seem that even the water that is drawn from the middle of the river, at the head of the delta, contains bacteria in far greater numbers than may safely be permitted in drinking-water, and that the powerful filters through which the water supplied to the better parts of the city is passed soon become choked with the germs. So impure, indeed, was the water shown to be, that the wealthier inhabitants of St Petersburg have their water brought in casks from the Duderhof heights. The average daily municipal supply of water was 59,900,000 gallons in 1898, and 65,311,000 gallons in 1899. For sanitary purposes, the city is divided into twenty-one districts, in each of which the municipality maintains one doctor (usually female) and several assistants, while the schools are regularly visited by twenty-eight municipal doctors. Six municipal laboratories are maintained for sanitary purposes.

Water supply. Sanitation.

Justice.

Justices of the peace, though abolished in Russia generally, are still maintained in a few large cities, including St Petersburg, and the city is divided into fifty-two justice of the peace districts. The number of persons arrested during the year 1898 was 128,895, of whom only 46,496 were arrested for crimes, while no less than 54,645 were only charged with breaches of the passport regulations and 18,528 with begging in the streets. Only 12,785 were condemned, 11,048 by the justices of the peace and the remainder by the courts of justice. St Petersburg contains two monasteries, and 247 churches and chapels of all denominations, including Jewish synagogues and Mussulman temples. It is also a great educational centre, to which youths flock from all parts of the empire. It has universities and high schools for male pupils, with an aggregate of 12,000 students; yet this number is so insufficient that there were, in 1897, 3612 applications for admission to the technical institutes, and only 711 vacancies. There is one medical academy for women, with 1630 students in 1900, one university with 839 students, and four other institutions for the higher education of women with 631 students, as also a school for agricultural education (50 students). For secondary education there were for boys sixty-six gymnasia, lyceums, military schools, and technical schools, with 16,000 pupils; and for girls sixty-two lyceums and high schools, with 9690 pupils. The Musical Conservatory has 870 pupils (522 women). The primary schools are in a far less satisfactory condition, as in 1898 there were only 600 schools, with nearly 40,000 pupils, out of which 341 schools, with 20,000 pupils, were kept by the municipality. Six libraries for the people are maintained by the municipality. Of the several modern museums the Historical Museum of Alexander III. deserves special mention. The number of scientific, literary, artistic, musical, and other societies is very great, and grows every year. St Petersburg is a great centre for printing, publishing as many books as Moscow. It contained in 1899, 60 printing offices, 30 lithographic establishments, 140 typo-lithographic offices, 95 photographic establishments, 141 book shops, and 55 public libraries. No fewer than 319 newspapers and reviews (including 25 dailies and 122 monthly reviews), that is, 38 per cent. of all periodical publications published in Russia, were issued at St Petersburg. It is estimated that all these publications represent an aggregate of 1,700,000 copies, and that every year no less than 134,000,000 separate numbers of different periodicals are issued. Nearly two-thirds of these go to the provinces. Philanthropic societies numbered 334 in 1898, and maintained 638 different institutions. They owned a capital of nearly 160,000,000 roubles, and their aggregate yearly income was estimated at over 2,000,000 roubles. No less than 107,000 persons applied to these institutions for assistance during 1898. The Foundling House and the institutions of the Empress Marie, the Imperial Philanthropic society, the Red Cross society, the Merchants' society, the Blue Cross society, the society of cheap restaurants and tea shops, and the society for supplying reading in the hospitals, are the most worthy of mention. The city and different philanthropic institutions maintain fifty-one hospitals, with nearly 14,000 beds, giving every year relief to about 75,500 persons.

Charities.

Industries.

From 1880 to 1890 was a very critical period in the history of the northern capital. With the development of the railway system, the southern and south-western provinces of Russia began to prosper more rapidly than the Upper Volga provinces; St Petersburg began to lose its relative importance in favour of the Baltic ports of Riga and Libau, and its rapid growth since the Crimean war seemed in danger of being stayed. The danger, however, passed away, and in the last decade of the 19th century it continued its advance with renewed vigour. A great influx of functionaries of all sorts, consequent upon the State taking into its hands the administration of railways, spirits, &c., resulted in the rapid growth of the population, while the introduction of a cheap railway tariff, and the subsidizing and encouraging in other ways of the great industries, attracted to St Petersburg a considerable number of workers, and favoured the growth of its larger industrial establishments. At the present time the province of St Petersburg—that is, properly speaking, the capital—is one of the foremost industrial provinces in Russia, its yearly returns amounting to 289,616,000 roubles, and placing it immediately after Moscow (380,000,000 roubles), and before Piotrków, in Poland (257,000,000 roubles). Out of a population in the capital of 954,400 in 1890, 218,354 were employed in industrial work of all sorts. Factories employed, in 1894, 75,775 workpeople (as against 26,000 only in 1866), of whom 51,095 were men and boys, 24,313 women and girls, and 367 children below 10 years of age. The chief factories were: cottons (17,092 workpeople, yearly returns 37,500,000 roubles), other textiles (7909 workpeople, yearly returns 18,640,000 roubles), metal and machinery works (18,155 workpeople, yearly returns 32,303,000 roubles), tobacco (10,090 workpeople, yearly returns 14,553,000 roubles), paper (2421 workpeople, yearly returns 4,414,000 roubles), soap and candles (2820 workpeople, yearly returns 6,478,000 roubles), breweries (2168 workpeople, yearly returns 6,346,000 roubles), distilleries (1953 workpeople, yearly returns 7,888,000 roubles), pastry and confectionery (1460 workpeople, yearly returns 3,159,000 roubles), chemicals (1314 workpeople, yearly returns 4,455,300 roubles). In all there were 503 factories, with 75,775 workmen, and yearly returns amounting to 173,000,000 roubles. These figures, however, must be below the actual ones, because it was found that 94 public companies showed returns of 204,500,000 roubles in 1898, and there are, besides, over 8000 workshops and small factories showing yearly returns of 73½ million roubles. Trade gave occupation in 1890 to 60,200 persons, and the 12,006 large shops and commercial enterprises showed in 1894 an aggregate return of 1,787,578,600 roubles. The export trade of St Petersburg is chiefly in grain (especially rye and oats), flour and bran, oil seeds, oil cakes, naphtha, eggs (271,236,000 in 1899), flax, and timber. It shows very great fluctuations, varying in accordance with the crops, and was valued during 1895–99, at from 73,000,000 roubles to 96,000,000 roubles. The exports are almost entirely to western Europe by sea (from 52,000,000 roubles to 62,500,000), and to Finland (from 15,000,000 to 27,000,000 roubles). The imports consist chiefly of coal, metals, building materials, herrings, coffee and tea, various better-class woods, raw cotton, wood pulp and cellulose, and manufactured goods. The ports of St Petersburg and Cronstadt were visited in 1898 by 2061 ships, of 1,518,400 tons, engaged in foreign trade, and by 3231 ships, of 261,000 tons, engaged in the coasting trade. Of all of these, only 3494 ships of 389,000 tons were under the Russian flag. Navigation on the Neva, which is the channel for all goods shipped from central Russia by way of the canals, is very great, no less than 20,737 vessels being unloaded in 1898. The number of passengers coming to St Petersburg or leaving it is also very great, the arrivals being (1898) 4,419,756 passengers, of whom nearly 730,000 came from the provinces. For internal communication there is a tramway system 88 miles long, which carried, in 1898, 85,000,000 passengers; and numerous services of steamers, both on the Neva and the canals, by which 9,663,000 passengers were transported in 1898.

Trade and navigation.

There is not the slightest doubt that the population of St Petersburg has made considerable intellectual progress, and that all-round education has begun to reach artisans and factory hands. Sunday schools, since they were reopened, have immensely con-

tributed to this result—chiefly owing to the voluntary efforts of a great number of men and women connected with education. The cheap daily press has penetrated into the masses of the Russian people, and especially of the population of the capitals, to an extent that is hardly realized outside of Russia; while quite a number of well-meaning publishers—some of them women—taking advantage of the fact that Russian books are printed for a population of a hundred million people, have edited the works of the Russian classics and the best authors, as also translations from west European authors, at prices which seem simply ridiculous in western Europe. Thus all works of Turguenieff, Goncharoff, &c., are published as free supplements to an excellent illustrated weekly, which costs only 10s. a year; or, all the works of Darwin are sold for 10s., while the works of the best Russian classics—Pushkin, Gogol, Lermontoff—are sold either for 3s. the complete edition, or for 2, 3, or 5 farthings as separate poems or novels. At the same time the industrial necessity of spreading education amongst the factory hands and artisans contributes to the same result, notwithstanding the opposition of the Government. As to the educated classes of St Petersburg, they have always stood at the head of progressive thought in Russia, and it is well known that it was chiefly owing to their support that it was possible to carry through the great reforms of the years 1861–66. Their demand for political reforms is supported now by a rapidly increasing class of artisans, working-men, and clerks, who all grow more and more conscious of their political rights. (P. A. K.)

Social progress.

St Pierre and Miquelon, two islands belonging to France in the Atlantic, 10 miles from the south coast of Newfoundland. Their united area covers 59,527 acres, or about 93 square miles. Both are mountainous, and several points are over 600 feet in height. Their importance is due to their proximity to the great Bank. In 1898 the settled population numbered 4700, of whom 1611 were men, 1494 women, and 1595 children. The floating population reaches 1650, giving a total of 6350 inhabitants. In 1888 the corresponding number was 6000, but it is doubtful whether the population increases. The chief town is St Pierre.

The islands are administered by a governor, assisted by a privy council and, since 1887, by a general council. They send a delegate to the Superior Council for the Colonies at Paris. The local Budget for 1899 was 519,865 francs; expenditure of France (Budget 1900), 282,938 francs. There is a colonial college for primary and secondary education, with 42 pupils; a higher class school for girls, with 76 pupils; and an *ouvroir* or workroom for training girls, with 40 pupils. Primary instruction is free. There are three commercial schools for boys and three for girls, with (in all) 23 teachers and 720 pupils. There are, besides, infant schools, *salles d'asile*, frequented by 342 children. Agriculture in the islands does not extend beyond vegetable gardens. Fishing is the great resource of the population, lasting from April to September, the port of St Pierre itself equipping 220 boats, which swell the numbers of French fishers at Cancale, St Malo, St Brieuc. In 1899 the catch on the great Bank amounted to 44,870 tons, valued at £296,000. In 1880 the weight caught was 17,000 tons. The subsidy granted to 309 boats of 21,948 tons and 6550 men, amounted to £13,100. The total commerce of the two islands in 1880 amounted to £1,280,000; in 1900, to £880,000: of the value in 1900, £388,000 was for imports and £492,000 for exports. The exports consisted of fish, fresh or dried, £388,000; cod oil, £41,200; lobsters, £16,000. The imports comprise alimentary substances and other articles of consumption. St Pierre is connected with Halifax and St Johns (Newfoundland) by a regular packet service. Besides the English cable, there has been a French cable to St Pierre since 1880.

See Henrique. *Les Colonies Françaises.* Paris, 1889.—Levasseur. *La France*, t. ii. Paris, 1893. *L'Année Coloniale*, 1900.

St Pierre. See Martinique.

St Pölten, a small town and episcopal see in Lower Austria, on the railway from Vienna to Salzburg. Population (1890), 10,906; (1900), 14,510, including garrison of 1219 men, almost exclusively German and Catholic. The industries include cotton spinning and milling, as well as the manufacture of iron and hardwares and small-arms.

St Quentin, chief town of arrondissement, department of Aisne, France, 95½ miles north-north-east of Paris by rail. Besides the very important, extensive, and varied textile industries, of which tulle, lace, and guipure form considerable branches, there are important foundries, large boiler works, machinery works for various special industries, and many brick and tile yards, while in the district are numerous sugar mills. The manufactured products, cotton and linen yarn, and grain are the objects of an active commerce. A monument of the siege of 1557 was erected in 1897, another monument commemorates the defence of the town in 1870, and there are statues of the artist Quentin Delatour (1704–88) and of the historian Henri Martin (1810–83), both natives of St Quentin. Port traffic (1900), 172,391 tons. Population (1901), 50,150.

Saint-Saëns, Charles Camille (1835–——), French composer, was born in Paris on 3rd October 1835. He lost his father when young, was brought up under the care of his mother, and began the study of music at an early age. After having as a child taken lessons in the piano from Stamaty, and learned the elements of composition from Maleden, both distinguished teachers of their time, he entered the Paris Conservatoire in the organ class, then presided over by Eugène Benoist, obtaining the second prize in 1849, and the first two years later. For a short time he studied composition under Halévy, and in 1852 competed without success for the Prix de Rome. Several years later, in 1864, he again attempted to win the much-coveted prize, but with no better result. Notwithstanding these unaccountable failures to obtain academic recognition of his extraordinary gifts, Saint-Saëns worked indefatigably at his art. In 1853, when only eighteen, he was appointed organist at the Church of St Merry. Eight years later he was called upon to preside at the organ of the Madeleine, in succession to Lefébure-Wély, a post which he retained until 1877. An overture entitled "Spartacus," which has remained unpublished, was crowned at a competition instituted in 1863 by the Société Sainte Cécile of Bordeaux. The greatest triumph of his early career was, however, attained in 1867, when the prize was unanimously awarded to him for his cantata "Les Noces de Prométhée" in the competition organized during the International Exhibition of that year, a prize competed for by over two hundred musicians.

The name of Saint-Saëns was gradually becoming known, if not to the bulk of the public, at least to the frequenters of concerts. He had acquired a great name as a pianist, and had made successful concert tours through Europe. So far, however, he had not succeeded in reaching the ears of the larger public by the production of an opera, which in France counts for more than anything else. After the tragic events of 1870, when Saint-Saëns did his duty as a patriot by serving in the National Guard, the opportunity at last offered itself, and a one-act opera from his pen, *La Princesse Jaune*, with words by Louis Gallet, was produced at the Opéra Comique with moderate success on 12th June 1872. *Le Timbre d'Argent*, a four-act opera performed at the Théâtre Lyrique in 1877, was scarcely more successful. In the meanwhile popularity accrued to the composer in the concert room, and his "symphonic poems" "Le Rouet d'Omphale," "Danse Macabre," "Phaéton," and "La Jeunesse d'Hercule" obtained for him a world-wide celebrity. These admirable examples of "programme music" count among his best known works.

His star was now in the ascendant, and was destined to shine on the operatic stage as well as in the concert room. Liszt, most noble-minded and unselfish of artists, ever ready to champion the cause of others, entertained the highest admiration for Saint-Saëns, and it was through his all-powerful influence that the French composer's Biblical opera *Samson et Dalila* was brought out at

Weimar in 1877. This work, which has been generally accepted as the composer's operatic masterpiece, had been begun as far back as 1869, and an act had been heard at one of Colonne's concerts in 1875. Notwithstanding its great success at Weimar, several years were destined to pass before it was to be heard in France, its first performance on French soil taking place at Rouen in 1890. The following year *Samson et Dalila* was given in Paris at the Eden Theatre, and finally in 1892 was produced at the Grand Opéra, where it has since remained as one of the most attractive works of the *répertoire.* Its Biblical subject has unfortunately stood in the way of its being performed on the London stage, but it has frequently been given in concert form with great success. The composer's subsequent operas may show an equal command of resource, but in none has he been so well inspired as in his musical setting of this Biblical tale. No work is better calculated to exemplify the dual tendencies of his style. The first act, with its somewhat formal choruses, suggests the influence of Bach and Handel, and is treated rather in the manner of an oratorio. The more dramatic portions of the opera are not uninfluenced by Meyerbeer, while in the mellifluous strains allotted to the temptress there are occasional suggestions of Gounod. Of Wagner there is but little trace, save in the fact that the composer has followed the German master's lead by dividing his work into scenes, thus avoiding the old-fashioned denominations of "air," "duet," "trio," &c. The score of *Samson et Dalila*, however, is not devoid of individuality. The influences mentioned above, possibly excepting that of Bach in the earlier scenes, are rather of a superficial nature, and do not detract from the originality that asserts itself throughout the work; for Saint-Saëns has undoubtedly a style of his own. It is a composite style, certainly; and all the materials that go towards forming it may not be absolutely his, that is, the eclecticism of his mind may lead him at one moment to adopt an archaic form of expression, at another to employ the current musical language of his day, and sometimes to blend the two. It is perhaps in the latter case that he shows most individuality; for although his works may denote the varied influences of such totally dissimilar masters as Bach, Beethoven, Liszt, and Gounod, he ever contrives to put in something of his own that gives his music the stamp of its authorship.

After the production of *Samson et Dalila*, Saint-Saëns stood at the parting of the ways. Looked at askance by the reactionary section of the French musicians, and suspected of harbouring subversive Wagnerian ideas, a notion strengthened by the enthusiastic articles he had published concerning the production of the *Ring des Nibelungen* at Bayreuth in 1876, but ready to be welcomed by the progressive party, it now remained to be seen which road he would follow. Both sides were doomed to disappointment, for in his subsequent operas Saint-Saëns attempted to effect a compromise between the older and the newer forms of opera. He had for some time caressed the idea of utilizing the history of France for operatic purposes. The first and only result of this project has been *Étienne Marcel*, an opera produced at Lyons in 1879. Although of unequal merit, owing partly to its want of unity of style, this work contains much music of an attractive kind, and scarcely deserves the neglect into which it has fallen. Forsaking the history of France for that of England, Saint-Saëns now set to work on an opera having for its hero "bluff King Hal." *Henry VIII.* was produced at the Paris Grand Opéra in 1883. The librettists had concocted a piece that was sufficiently well knit and abounded in dramatic contrasts. While adhering to his system of compromise by retaining certain conventional operatic features, Saint-Saëns had in this instance advanced somewhat by employing *leit motivs* in a more rigorous fashion than hitherto, although he had not gone so far as to discard airs cut after the old pattern, duets, and quartets. *Henry VIII.*, which was given at Covent Garden during the season of 1898, certainly occupies an honourable place among the composer's works. *Proserpine*, a lyrical drama produced at the Paris Opéra Comique in 1887, may be said to have achieved a *succès d'estime* and no more. A not much better fate befell *Ascanio*, an opera founded on Paul Meurice's drama *Benvenuto Cellini*, and brought out at the Grand Opéra in 1890. *Phryné*, however, a two-act trifle of a light description, produced at the Opéra Comique in 1893, met with success; and his "lyrical drama" *Les Barbares*, given at the Grand Opéra in 1901, has been received with marked favour.

Saint-Saëns worked in every field of his art and succeeded in all. The following condensed list of his compositions proves this better than words. Besides the operas above alluded to, he composed the following oratorios and cantatas: "Oratorio de Noël," "Les Noces de Prométhée," Psalm "Cœli enarrant," "Le Déluge," "La Lyre et la Harpe"; three symphonies; four symphonic poems ("Le Rouet d'Omphale," "Phaéton," "Danse Macabre," "La Jeunesse d'Hercule"); five pianoforte concertos; three violin concertos; two suites, marches, and other works for orchestra; the ballet *Zavotte*; music to the drama *Déjanire*, given at the open-air theatre of Béziers; a quintet for piano and strings, a quartet for piano and strings, two trios for piano and strings, a string quartet, a septet, violoncello sonata, two violin sonatas; a Mass, a Requiem, besides a quantity of piano and organ music, and many songs, duets, and choruses. He also published three books, entitled *Harmonie et Mélodie*, *Portraits et Souvenirs*, and *Problèmes et Mystères*, besides a volume of poems, *Rimes familières.* The honorary degree of Doctor of Music was conferred upon him by Cambridge University in 1893.

St Servan. See St Malo.

St Thomas, an incorporated city and port of entry of Ontario, Canada, capital of Elgin county, on Kettle creek, 13 miles south of London and 8 miles north of Lake Erie. It is an important station on the Grand Trunk, Michigan Central, Lake Erie and Detroit River, and Canadian Pacific railways. The principal public buildings are the city hall, court house, and post office; there are six schools, a collegiate institute, and Alma ladies' college. The Michigan Central railway shops, car-wheel foundry, flour, flax, and planing mills, are the principal industries. Population (1891), 10,366; (1901), 11,485.

St Thomas, St Croix, AND **St John,** three of the Virgin islands of the West Indies, situated—the first-named 40 miles east of Porto Rico, the second 65 miles south-east of Porto Rico and 40 miles south of St Thomas, and the third 4 miles east of St Thomas. Their respective dimensions, areas, and populations are given in the following table:—

Island.	Length. Miles.	Width. Miles.	Area. Square Miles.	Population, 1835.	Population, 1890.	Population, 1901.	Density per Square Mile, 1901.
St Thomas	13	1–4	33	14,022	12,019	11,012	334
St Croix .	22	1–6	84	26,681	19,783	18,567	221
St John .	10	$2\frac{1}{2}$	21	2,475	984	925	44
Total .	...	...	138	43,178	32,786	30,504	221

The population has thus diminished by 29·3 per cent, since 1835. In 1901 there were 14,026 males and 16,478

females; and 58·4 per cent. (17,826) lived in the towns and 41·6 per cent. (12,678) in the country districts. The chief towns are Charlotte Amalie, the capital of St Thomas, with 8540 inhabitants in 1901; Christiansted, the capital of St Croix, with 5483 inhabitants; Frederiksted, also on St Croix, with 3745 inhabitants; and Cruxbay, on St John, with 58 inhabitants. Five-sixths of the inhabitants are the descendants of negro slaves brought from Africa, chiefly in the period of the Napoleonic wars; the remaining one-sixth are whites, mostly Danes and British. The prevailing language is English, but Danish, Dutch, French, Spanish, and German are also used. Except in the southern half of St Croix, the islands are all hilly, the culminating point in St Thomas being West Mountain (1555 feet); in St Croix, Blue Mountain (1155 feet); and in St John, 1270 feet. St Thomas and St John stand on a continuation of the ridge which supports the Greater Antilles (Cuba, Hayti, Porto Rico); but St Croix is the westernmost promontory of the submarine elevation on which the Lesser Antilles stand. All three islands are built up of eruptive rocks (porphyry and granite) of ancient origin and much disintegrated. The cultivable area is relatively small, but the soil is generally from 10 to 50 feet deep. St Croix possesses relatively the largest share of cultivated ground, namely, 57½ per cent. pasture and 32 per cent. planted with the sugar-cane, tobacco, and fruits, while the remaining 10½ per cent. is uncultivated. Sugar, tobacco, bay rum, and tropical fruits are the principal productions, the first-named being by far the most important. Lying as they do within the tropics, these islands are naturally hot, and the daily range of temperature is comparatively small, only 9°; indeed the yearly range is not great, the maximum being 92° in September, and the minimum 69° in January. The annual mean of St Croix (81°) is about 3·5° higher than the annual mean of St Thomas (77·5°). But the heat is greatly modified by the constant and invigorating trade-winds; so that, on the whole, the climate is fine and salubrious. The rain falls, as a rule, in short, heavy showers, the annual mean of both St Thomas and St Croix lying between 44½ and 47 inches. Earthquakes are frequent, but as a rule are not severe. The fierce hurricanes are much more dreaded; those of the years 1713, 1738, 1742, 1772, 1793, 1819, 1837, and 1899 having been especially destructive.

Since the introduction of steam ocean-going vessels St Thomas has gradually lost the greater part of the trade which she had as one of the chief emporia of the West Indies, and the decline has been more marked since 1885, when Barbados took the place of St Thomas as a trade-distributing centre. Whereas in 1885 the total trade was valued at £594,130 (of which £446,290 represented St. Thomas' share), the total value in 1898 did not exceed £342,350. The country which has the largest share in this trade is the United States. In 1821 the trade between these three islands and the United States was valued at £692,222 ($3,461,110); in 1861, £365,880 ($1,829,400); and £234,082 ($1,170,410) in 1901. But the principal value and importance of the little group lies in the suitability of St Thomas for a coaling station, and eventually, no doubt, as a naval base for the United States, for its geographical position invests it with a high strategic value (Captain Mahan). It is a port of call for coaling of the Hamburg-American line, Transatlantic Steamship Company, Royal Mail Company, and others. The port is situated about the middle of the south coast of the island, and consists of an almost landlocked basin, about three-quarters of a mile across, approached by a narrow entrance of only 300 yards at its minimum; the depth varies from 27 feet to 36 feet. It is equipped with a floating dry dock, 300 feet long, which can accommodate vessels up to 3000 tons burden, and with well-fitted ship-repairing yards. The port of Christiansted, on a creek on the north side of St Croix, is to a large extent choked up with mud; and Frederiksted, at the western end of the same island, is little better than an open roadstead. But in Coral Bay St John possesses one of the best harbours of refuge in the Antilles, when the dreaded hurricanes are raging.

From 1865 the islands were continuously governed at a loss to the mother country of Denmark; their total indebtedness on this score amounted in 1898 to the sum of £216,720. The idea of the United States buying these islands from Denmark was first broached by Secretary Seward in 1865, and the islands were virtually sold for the sum of 7½ million dollars, but the treaty failed to get the ratification of the United States Senate. Negotiations were reopened in 1892, and matters were again so far advanced that in 1902 another treaty of cession was signed on 17th February, in virtue of which the purchase price was fixed at 5 million dollars; and this was duly ratified by the United States Senate, and by the Danish Folkething, subject to the assent of the inhabitants of the islands. The earlier history of these islands is given under the several headings in the ninth edition of this work.

See Rev. John P. Knox, *A Historical Account of St Thomas, and Incidental Notices of St Croix and St John* (1850), and James Parton, *The Danish Islands* (1869).

St Vincent, one of the British Windward Islands. Population (1891), 41,054 (2445 white, 7554 coloured, and 31,055 black); (1900), estimated at 44,600. About 330 of these were East Indian coolies, and a few Caribs of somewhat mixed blood, the majority of the aboriginal Caribs having been deported to British Honduras in 1797. Kingstown, the capital, situated on a bay at the south-western extremity of the island, has a population of about 4000. The climate is healthy. The coolest time of the year is from December to May; the wet season is from August to November. The maximum reading of the thermometer during 1899 was 88·5° (in August); the minimum 68·5° (in December). The average annual rainfall is 111·82 inches. There are 77 miles of highway running round the island, for the most part close to the coast; but on the leeward side communication is mainly by boat. There are 129 miles of telephone. Imports in 1899, £103,627; exports, £63,293. In the hurricane of 1898 nearly 300 persons lost their lives, and no less than 30,000 persons were rendered homeless; damage was done to the extent of £225,000. Revenue (1899) (including £31,075 from Imperial funds), £33,575; expenditure (including £17,534 from Imperial funds), £47,855; public debt, £15,710. The principal trade is with the United States of America, trade with the United Kingdom having declined. Sugar and arrowroot were, until 1898, the principal products; the hurricane of that year almost extinguished the sugar industry, which was already decaying; whilst, on the other hand, the arrowroot works then destroyed were replaced by better equipped premises. Other articles of export are cacao, cotton, spices, fruit, vegetables, live stock, and poultry. Crown lands, situated in the centre of the island at altitudes varying from 200 to 4000 feet, comprise between one-half and one-third of the whole island. The tonnage of the vessels entered and cleared during 1899 was 245,588, nearly all being British. The Anglican, Wesleyan, and Roman Catholic churches are well represented, and there are some Presbyterians. In 1898 there were 98 State-aided schools, with 7509 children on the roll, and an average daily attendance of 3158. There is a grammar school at Kingstown, the capital. An agricultural school was opened in 1900.

The present constitution dates from 1877, when the legislative council, consisting of four official and four nominated unofficial members, was formed. In 1899 an important scheme was entered upon, by means of a grant of £15,000 from the Imperial treasury, for settling the labouring population, distressed by the failures of the sugar industry, in the position of peasant proprietors.

In May 1902 the island was devastated by a terrible eruption from the Soufrière, contemporaneously with the eruption of Mont Pelée in Martinique (*q.v.*), and extensive damage and loss of life was caused, the remaining Black Caribs being reported to be entirely wiped out. An account of the calamity was given in a letter to the *Standard* by Mr F. H. Watkins, the Commissioner of Montserrat, which, in the absence of fuller details at the

time when this article had to go to press, may here be quoted:—

"St Vincent is divided by a high mountain ridge, running from north to south, at the northern end of which is the *Soufrière*, which, rising to about 3000 feet in the centre of the island, dominates both the leeward and windward districts in that portion of it. The *Soufrière* has, or rather had, two craters, the old and new, the latter, to the south-east of the former, having been formed by the eruption of 1812, which has been so vividly described in Charles Kingsley's *At Last*. The craters are divided by an exceedingly knife-like ridge, along which it required a cool head to creep. The old crater, 3 miles in circumference, contained a lake, reposing at the depth of several hundred feet below the edge, over which clouds of vapour and mist were constantly hovering. The new crater, smaller than its neighbour, but more rugged and precipitous, looked, as it has been graphically described, like 'an opening into the great infernal regions.' At the leeward base of the *Soufrière* lay the estates of Wallibou and Richmond, Morne Ronde, the settlement of the Black Caribs, and, to the south-west, the small town of Châteaubellair; while on the windward side were the great sugar estates of the Carib quarter, Sandy Bay, the settlement of the pure Caribs; and to the extreme north, the arrowroot estates of Owia and Fancy. Almost opposite to Châteaubellair, on the windward coast, is Georgetown, the second town of St Vincent. The *Soufrière* may be said to have at least one-third of the island within its range of possible destruction. Premonitory signs of eruption had been given since February 1901, when shocks of earthquake and deep reverberations were felt; but as they passed away, little attention was given to them. These warnings were repeated as soon as the Mont Pelée volcano at Martinique showed activity, and increased in force until 6th May, when all doubts as to their true meaning were dissipated. At three p.m. on that day huge columns of smoke were seen from Châteaubellair to issue from the old crater, followed by streams of flame. So serious was the condition of affairs, that several officials were sent from the capital, Kingstown, 15 miles off, to report upon what was happening, and they found the mountain in full eruption. Early on the following (Wednesday) morning the eruption ceased, and left the surrounding country in gloom. So far the windward side had escaped with little damage. Shortly after eight the volcano once more burst into activity, the full force being experienced from one o'clock to three o'clock p.m. For more than 400 miles the sound as of heavy cannonading at sea was heard throughout the West Indies. In Kingstown lamps had to be lighted at four o'clock in the afternoon, and ashes fell in Barbados, which lies about 100 miles to windward of St Vincent. On the windward side the estate works at Tourama, Orange Hill, and Lot 14 were completely destroyed; on the leeward side Wallibou was covered up, and the chimney at Richmond was the sole sign of the works."

A Mansion House Fund was at once started in London for the relief of the sufferers, and subscriptions were sent from all parts of the civilized world, and notably from the United States. (F. CU.)

Saiyid Ahmad, SIR (1817–1898), Mahommedan educationist and reformer, was born at Delhi, India, in 1817. He belonged to a family which had come to India with the Afghan conquest, and had held high offices under the Mogul emperors. Although his imperfect acquaintance with English prevented his attainment of higher office than that of a judge of a small cause court, he earned the title of the recognized leader of the Mahommedan community. To the British he rendered loyal service, and when the wave of mutiny reached Bijnaur in Rohilkand in May 1857, the British residents owed their lives to his courage and tact. The same spirit of loyalty made him oppose the Congress movement at a later date. His faithfulness to his religion was pronounced, and in 1876 he defended the cause of Islam in *A Series of Essays on Mahommed*, written in London. Of good ancestry, and true to the faith, he used these advantages to act as interpreter between the Mahommedans and their rulers, and to rouse his countrymen to a sense of the benefits of modern education. The task was no light one. The horrors of the invasions of Nadir Shah and Ahmad Shah were fading from the memories of the rising generation. A flicker of hope excited society when Shah Alam was rescued from his Maratha guard, and in 1803 restored to some measure of independence. Disappointment followed when in 1832 the Company began to administer Delhi, but Hindustan was used to revolutions, and it awaited a turn of fortune. At least the Mahommedans might keep aloof from British officials and English education and study Persian and Arabic in their mosques. Saiyid Ahmad felt their mistake and set himself to alter their resolution. He established a translation society, which became the Scientific Society of Aligarh. He wrote letters from England to draw the hearts of the East to the West. In 1873 he founded the Mahommedan Anglo-Oriental College, and raised funds for the buildings of which Lord Lytton laid the foundation stone. He stimulated a similar movement elsewhere, and among other cities Karachi, Bombay, Haidarabad caught the infection of his spirit. Thus he effected a revolution in the attitude of Mahommedans towards modern education. He was made K.C.S.I., and became a member of the legislative councils of India and Allahabad, and of the Education Commission. These honours marked the official view of his services, but his lasting monument is the Aligarh College, with its regular outflow of educated Mahommedans into public life. He died at Aligarh on 2nd March 1898. (W. L.-W.)

Sakhalin, an island of Russia, in the Pacific Ocean, lying opposite the mouth of the Amur, with an area of 29,336 square miles and a domiciled Russian population which in 1897 numbered 28,113, of whom only 7641 were women. The population is chiefly composed of convicts and exiles, but a number of free settlers have lately gone to the island. There were, in 1897, 4979 hard-labour convicts (755 women), 1566 released convicts (293 women), and 6934 exiles (879 women), making a total of 13,479, or 42 per cent. of the Russian population; besides which there were 4500 natives, Ghilyaks, and Ainos. The chief military posts on the island are Due (1049), Alexandrovsk (3857), Southern (1166), and Korsakovsk (1664). The chief villages are Rykovskoye and Derbinskoye. The convicts are employed in obtaining coal, timber, and fuel, and in making roads. Owing to a dearth of schools, less than one-fourth of the children are educated. Only 7890 acres were under crops in 1898; rye, wheat, oats, barley, and vegetables are grown. There were in 1898, 1890 horses, 6000 horned cattle, and 1020 swine. Some 2300 tons of coal are obtained annually. The natives, as also a number of Japanese and a Russian company, are engaged in fishing, which seems to be productive, as the duty paid on exported fish amounted to 32,220 roubles in 1897. The Japanese also carry on a large export trade in edible sea-weeds.

Sakura-jima, an island belonging to Japan, oval in shape and measuring 7 miles by 5, lying in the northern part of the Bay of Kagoshima (30° 40′ N., 130° 35′ E.). It has a steaming volcano 3743 feet high (last eruption 1779), and is celebrated for its springs, its oranges, and its giant radishes (*daikon*), which sometimes weigh as much as 70 ℔.

Sala, a town of Sweden, county of Vestmanland, between two small lakes, 39 miles west by north of Upsala by rail. It owes its importance to the silver mine of Salberg, 1½ miles south-west of the town, which has been worked since 1510, and produces about 33,000 oz. of silver annually, as well as dolomite. Population (1900), 6593.

Sala, George Augustus Henry (1828–1895), English journalist, was born in London, 24th November 1828; his father (1792–1828) being the son of an Italian who came to London to arrange ballets at the theatres, and his mother (1789–1860) an actress and

teacher of singing. He was at school at Paris from 1839 to 1842, and learnt drawing in London, and in his earlier years he did odd jobs in scene-painting and book illustration, the connexion of his mother and elder brother (Charles Kerrison Sala) with the theatre giving him useful introductions to authors and artists. At an early date he tried his hand at writing, and in 1851 attracted the attention of Charles Dickens, who published articles and stories by him in *Household Words* and subsequently in *All the Year Round*, and in 1856 sent him to Russia as a special correspondent. About the same time he got to know Edmund Yates, with whom, in his earlier years, he was constantly connected in his journalistic ventures. In 1860, over his own initials, "G. A. S.," he began writing "Echoes of the Week" for the *Illustrated London News*, and continued to do so till 1886, when they were continued in a syndicate of weekly newspapers almost to his death. Thackeray, when editor of the *Cornhill*, published articles by him on Hogarth in 1860, which were issued in volume form in 1866; and in the former year he was given the editorship of *Temple Bar*, which he held till 1866. Meanwhile he had become in 1857 a contributor to the *Daily Telegraph*, and it was in this capacity that he did his most characteristic work, whether as a foreign correspondent in all parts of the world, or as a writer of "leaders" or special articles. His literary style, highly coloured, bombastic, egotistic, and full of turgid periphrases, gradually became associated by the public with their conception of the *Daily Telegraph;* and though the butt of the more scholarly literary world, his articles were invariably full of interesting matter and helped to make the reputation of the paper. He collected a large library and had an elaborate system of keeping commonplace-books, so that he could be turned on to write upon any conceivable subject with the certainty that he would bring into his article enough show or reality of special information to make it excellent reading for a not very critical public; and his extraordinary faculty for never saying the same thing twice in the same way had a sort of "sporting" interest even to those who were more particular. He earned a large income from the *Telegraph* and other sources, but he never could keep his money. In 1892, when his popular reputation was at its height, he started a weekly paper called *Sala's Journal*, but it was a disastrous failure; and in 1895 he had to sell his library of 13,000 volumes. Lord Rosebery gave him a civil list pension of £100 a year, but he was a broken-down man, and he died at Brighton on 8th December 1895. Sala published many volumes of fiction, travels, and essays, and he edited various other works, but his *métier* was that of ephemeral journalism; and his name goes down to posterity as perhaps the most popular and most voluble of the newspaper men of the period.

Salaam, Dar-es-. See East Africa, German.

Salado River. See Plate River.

Salamanca, a province of western Spain; area, 4940 square miles, divided into 8 districts and 388 parishes; population, 314,472 in 1887, 317,005 in 1897. The average of births is 4·38 per cent., of deaths 3·36 per cent., and the proportion of illegitimate births is 4·83. It is one of the provinces of Spain which loses least by emigration. The railways of the province have been much developed. Besides the line that branches off from the Northern Railway at Medina del Campo, there are lines from Bejar to Zamora, *viâ* Salamanca, Salamanca to Avila by Peñaranda. The principal industries are connected with agriculture. The cloth manufactories of Bejar, Candelairo, Peñaranda, are decaying.

Three-quarters of the province are well wooded—beech, oak, chestnut, pines, abounding in the south and south-west districts. Timber for building purposes and firewood are largely sent to the rest of Spain. About 2,500,000 acres are cultivated, only a small proportion being well irrigated. In 1897 wheat was grown on 278,127 acres; maize, oats, barley, rye, on 176,137; pod fruit on 172,492; vines on 34,897; olives on 9500. Badajoz, Caceres, and Teruel alone, out of the 49 provinces of Spain, have more live stock than Salamanca. Out of 925,319 head registered in 1897, 8082 were horses, 8745 mules, 35,399 asses, 98,494 cattle, 623,272 sheep, 65,167 goats, and 86,220 pigs.

Salamanca, capital of the above province, with a station on the railway from Medina del Campo to the Portuguese frontier. The oldest of Spanish university towns is still rich in educational establishments, though much shorn of its ancient prosperity, when it had a population of 50,000 souls, including 10,000 students from all parts of Spain and from abroad. Salamanca still keeps up her university, with the separate faculties of letters, philosophy, sciences, law, and medicine; her university and provincial public library, with 100,000 volumes, a provincial institute, a superior normal school, a seminary founded in 1778, economic and other learned societies, and very many charitable foundations. The city has still its 25 parishes, 25 colleges, and as many more or less ruinous convents and 10 yet flourishing religious houses. Side by side with the remains of a great past are the modern buildings: two theatres, casino, a bull-ring, the town-hall, and electric light factory. Salamanca maintains its Irish college, the rector and teachers of which are in general Irishmen. Population (1887), 22,199; (1897), 24,156.

Sálár Jung, Sir (1829–1883), Indian statesman, born in 1829, was the descendant of a family which had held various court and military appointments, first under the 'Adil Sháhí kings of Bíjápúr, then under the Delhi emperors, and lastly under the Nizáms. While he was known to the British as Sir Sálár Jung, his personal name was Mír Turáb Alí, he was styled by native officials of Haidarabad the Mukhtaru 'l-Mulk, and was referred to by the general public as the Náwáb Sáhib. He succeeded his uncle Suráju 'l-Mulk as prime minister, 1853. Owing to the failure of the Nizám to fulfil his treaty obligations to the British Government, the province of Berar had just been separated from his dominions and incorporated with the British possessions. The condition of the Nizám's state was at that time a scandal to the rest of India, and Sálár Jung at once set about reform. He commenced by infusing a measure of discipline into the Arab mercenaries, who composed the more valuable part of the Nizám's army. He then employed them against the rapacious nobles and bands of robbers who had annihilated the trade of the country. When he had attained some degree of internal security, he constituted courts of justice at Haidarabad, organized the police force, constructed and repaired irrigation works, and established schools. On the outbreak of the Mutiny he supported the British, and although unable to hinder an attack on the residency, he warned the British minister that it was in contemplation. The attack was repulsed; the Haidarabad Contingent remained loyal, and their loyalty served to ensure the tranquillity of the Deccan. Sálár Jung took advantage of the preoccupation of the British Government with the Mutiny to push his reforms more boldly, and when the Calcutta authorities were again at liberty to consider the condition of affairs in the native states, his work had been carried far towards completion. During the lifetime of the Nizám Afzalu'd-daula, Sálár Jung was considerably hampered by his master's jealous supervision. His actions were watched by innumerable spies, and in the palace his attitude could only be compared to that of an abject slave. When Mír

Mahbub Alí, however, succeeded his father in 1869, Sálár Jung, at the instance of the British Government, was associated in the regency with the principal noble of the state, the Shamsu 'l-Umára or Amír Kabír, and enjoyed an increased authority. In 1876 he visited England with the purpose of obtaining the restoration of Berar. Although he was unsuccessful, his personal merits met with full recognition. He died of cholera at Haidarabad on 8th February 1883. He was created G.C.S.I. on 28th May 1870, and received the honorary degree of D.C.L. from the University of Oxford on 21st June 1876.

See *Memoirs of Sir Sálár Jung*, by his private secretary, Syed Hossain Bilgrami, 1883. (E. I. C.)

Sale, an urban district, Cheshire, England, in the Altrincham parliamentary division of the county, about 5 miles south of Manchester by rail, on the Mersey and the Bridgewater canal. Among modern buildings are St Paul's Church and Roman Catholic and Wesleyan chapels. In 1892 works for the purification of sewage were constructed at a cost of £18,000. A public free library was erected in 1891. Population of the urban district (1891), 9644; (1901), 12,088.

Sale of Goods.—Sale is commonly defined as the transfer of property from one person to another for a price. This definition requires some consideration in order to appreciate its full scope. The law of sale is usually treated as a branch of the law of contract, because sale is effected by contract. Thus Pothier entitles his classical treatise on the subject, *Traité du contrat de vente*, and the Indian Contract Act (ix. of 1872) devotes a chapter to the sale of goods. But a completed contract of sale is something more. It is a contract plus a transfer of property. An agreement to sell or buy a thing, or, as lawyers call it, an executory contract of sale, is a contract pure and simple. A purely personal bond arises thereby between seller and buyer. But a complete or executed contract of sale effects a transfer of ownership with all the advantages and risks incident thereto. By an agreement to sell a *jus in personam* is created; by a sale a *jus in rem* is transferred. The essence of sale is the transfer of property for a price. If there be no agreement for a price, express or implied, the transaction is gift, not sale, and is regulated by its own peculiar rules and considerations. So too if commodity be exchanged for commodity, the transaction is called barter, and not sale, and the rules relating to sales do not apply in their entirety. Again, a contract of sale must contemplate an absolute transfer of the property in the thing sold or agreed to be sold. A mortgage may be in the form of a conditional sale, but English law regards the substance and not the form of the transaction. If in substance the object of the transaction is to secure the repayment of a debt, and not to transfer the absolute property in the thing sold, the law at once annexes to the transaction the complex consequences which attach to a mortgage. So too it is not always easy to distinguish a contract for the sale of an article from a contract for the supply of work and materials. If a man orders a set of false teeth from a dentist the contract is one of sale, but if he employs a dentist to stop one of his teeth with gold the contract is for the supply of work and materials. The distinction is of practical importance, because very different rules of law apply to the two classes of contract. The property which may be the subject of sale may be either movable or immovable, tangible or intangible. The present article relates only to the sale of goods, that is to say, tangible movable property. By the laws of all nations the alienation of land or real property is, on grounds of public policy, subject to special regulations. It is obvious that the assignment of "things in action," such as debts, contracts, and negotiable instruments, must be governed by very different principles from those which regulate the transfer of goods, when the object sold can be transferred into the physical possession of the transferee.

The Code of 1893.

In 1847, when Mr Justice Story wrote his work on the sale of personal property, the law of sale was still in process of development. Many rules were still unsettled, especially the rules relating to implied conditions and warranties. But for several years the main principles have been well settled. In 1891 the subject seemed ripe for codification, and Lord Herschell introduced a codifying Bill which two years later passed into law as the Sale of Goods Act, 1893 (56 and 57 Vict. c. 71). Sale is a consensual contract. The parties to the contract may supplement it with any stipulations or conditions they may see fit to agree to. The code in no wise seeks to fetter this discretion. It lays down a few positive rules, such, for instance, as that which reproduces the 17th section of the Statute of Frauds. But the main object of the Act is to provide clear rules for those cases where the parties have either formed no intention or have failed to express it. When parties enter into a contract they contemplate its smooth performance, and they seldom provide for contingencies which may interrupt that performance, such as the insolvency of the buyer or the destruction of the thing sold before it is delivered. It is the province of the code to provide for these contingencies, leaving the parties free to modify by express stipulation the provisions imported by law. When the code was in contemplation the case of Scotland gave rise to difficulty. Scottish law varies widely from English. To speak broadly, the Scottish law of sale differs from the English by adhering to the rules of Roman law, while the English common law has worked out rules of its own. Where two countries are so closely connected in business as Scotland and England, it is obviously inconvenient that their laws relating to commercial matters should differ. The Mercantile Law Commission of 1855 reported on this question, and recommended that on certain points the Scottish rule should be adopted in England, while on other points the English rule should be adopted in Scotland. The recommendations of the Commission were partially and rather capriciously adopted in the English and Scottish Mercantile Law Amendment Acts of 1856. Certain rules were enacted for England which resembled but did not really reproduce the Scottish law, while other rules were enacted for Scotland which resembled but did not really reproduce the English law. There the matter rested for many years. The Codifying Bill of 1891 applied only to England, but on the advice of Lord Watson it was extended to Scotland. As the English and Irish laws of sale were the same, the case of Ireland gave rise to no difficulty, and the Act now applies to the whole of the United Kingdom. As regards England and Ireland very little change in the law has been effected. As regards Scotland the process of assimilation has been carried further, but has not been completed. In a few cases the Scottish rule has been saved or re-enacted, in a few other cases it has been modified, while on other points, where the laws were dissimilar, the English rules have been adopted. It is perhaps to be regretted that the process of assimilation was not fully carried out by the Act. In mercantile matters the certainty of the rule is often of more importance than its substance. If the parties know beforehand what their legal position is, they can provide for their particular needs by express stipulation. Still, the way has been paved for future uniformity. The law is contained within the four corners of the Act, and it is

a much easier matter to amend a statute than to alter common law.

Now that the law has been codified, an analysis of the law resolves itself into an epitome of the main provisions of the statute. The Act is divided into six parts, the first dealing with the formation of the contract, the second with the effects of the contract, the third with the performance of the contract, the fourth with the rights of an unpaid seller against the goods, and the fifth with remedies for breach of contract; the sixth part is supplemental. The 1st section, which may be regarded as the keystone of the Act, is in the following terms:—"A contract of sale of goods is a contract whereby the seller transfers or agrees to transfer the property in goods to the buyer for a money consideration called the price. A contract of sale may be absolute or conditional. When under a contract of sale the property in the goods is transferred from the seller to the buyer the contract is called a 'sale,' but when the transfer of the property in the goods is to take place at a future time or subject to some condition thereafter to be fulfilled the contract is called an 'agreement to sell.' An agreement to sell becomes a sale when the time elapses or the conditions are fulfilled subject to which the property in the goods is to be transferred." This section clearly enunciates the consensual nature of the contract, and this is confirmed by section 55, which provides that "where any right, duty, or liability would arise under a contract of sale by implication of law," it may be negatived or varied by express agreement, or by the course of dealing between the parties, or by usage, if the usage be such as to bind both parties to the contract. The next question is who can sell and buy. The Act is framed on the plan that if the law of contract were codified, this Act would form a chapter in the code. The question of capacity is therefore referred to the general law, but a special provision is inserted (section 2) relating to the supply of necessaries to infants and other persons who are incompetent to contract. Though an infant cannot contract he must live, and he can only get goods by paying for them. The law, therefore, provides that he is liable to pay a reasonable price for necessaries supplied to him, and it defines necessaries as "goods suitable to the condition in life of such minor or other person, and to his actual requirements at the time of the sale and delivery."

The 4th section of the Act reproduces the famous 17th section of the Statute of Frauds, which was an Act "for the prevention of frauds and perjuries." The object of that statute was to prevent people from setting up bogus contracts of sale by requiring material evidence of the contract. The section provides that "a contract for the sale of any goods of the value of ten pounds or upwards shall not be enforceable by action unless the buyer shall accept part of the goods so sold, and actually receive the same, or give something in earnest to bind the contract, or in part payment, or unless some note or memorandum in writing of the contract be made and signed by the party to be charged, or his agent in that behalf." It is a much disputed question whether this enactment has done more good or harm. It has defeated many an honest claim, though it may have prevented many a dishonest one from being put forward. When judges and juries have been satisfied of the *bona fides* of a contract which does not appear to satisfy the statute, they have done their best to get round it. Every expression in the section has been the subject of numerous judicial decisions, which ran into almost impossible refinements, and illustrate the maxim that hard cases make bad law. The last edition of the late Mr Benjamin's book on Sale contains 950 pages, of which number no less than 180 are devoted to the decisions on the few lines cited above. Only one thing is certain. The Statute of Frauds has brought much grist to the legal mill. It is to be noted that Scotland is excluded from the operation of section 4. The Statute of Frauds has never been applied to Scotland, and Scotsmen appear never to have felt the want of it.

As regards the subject-matter of the contract, the Act provides that it may consist either of existing goods or "future goods," that is to say, goods to be manufactured or acquired by the seller after the making of the contract (§ 5). Suppose that a man goes into a gunsmith's shop, and says, "This gun suits me, and if you will make or get me another like it I will buy the pair." This is a good contract, and no question as to its validity would be likely to occur to the lay mind. But lawyers have seriously raised the question, whether there could be a valid contract of sale when the subject-matter of the contract was not in existence at the time when the contract was made. The price is an essential element in a contract of sale. It may be either fixed by the contract itself, or left to be determined in some manner thereby agreed upon, *e.g.*, by the award of a third party. But there are many cases in which the parties intend to effect a sale, and yet say nothing about the price. Suppose that a man goes into a hotel and orders dinner without asking the price. How is it to be fixed? The law steps in and says that, in the absence of any agreement, a reasonable price must be paid (§ 8). This prevents extortion on the part of the seller, and unreasonableness or fraud on the part of the buyer.

Warranty.

The next question dealt with is the difficult one of conditions and warranties (§§ 10 and 11). The parties may insert what stipulations they like in a contract of sale, but the law has to interpret them. The term "warranty" has a peculiar and technical meaning in the law of sale. It denotes a stipulation which the law regards as collateral to the main purpose of the contract. A breach, therefore, does not entitle the buyer to reject the goods, but only to claim damages. Suppose that a man buys a particular horse, which is warranted quiet to ride and drive. If the horse turns out to be vicious, the buyer's only remedy is to claim damages, unless he has expressly reserved a right to return it. But if, instead of buying a particular horse, a man applies to a dealer to supply him with a quiet horse, and the dealer supplies him with a vicious one, the stipulation is a condition. The buyer can either return the horse, or keep it and claim damages. Of course the right of rejection must be exercised within a reasonable time. In Scotland no distinction has been drawn between conditions and warranties, and the Act preserves the Scottish rule by providing that, in Scotland, "failure by the seller to perform any material part of a contract of sale" entitles the buyer either to reject the goods within a reasonable time after delivery, or to retain them and claim compensation (§ 11 (2)). In England it is a very common trick for the buyer to keep the goods, and then set up in reduction of the price that they are of inferior quality to what was ordered. To discourage this practice in Scotland the Act provides that, in that country, the court may require the buyer who alleges a breach of contract to bring the agreed price into court pending the decision of the case (§ 59). It seems a pity that this sensible rule was not extended to England.

In early English law *caveat emptor* was the general rule, and it was one well suited to primitive times. Men either bought their goods in the open market-place, or from their neighbours, and buyer and seller contracted on a footing of equality. Now the complexity of modern commerce, the division of labour, and the increase of technical

skill, have altogether altered the state of affairs. The buyer is more and more driven to rely on the honesty, skill, and judgment of the seller or manufacturer. Modern law has recognized this, and protects the buyer by implying various conditions and warranties in contracts of sale, which may be summarized as follows:—First, there is an implied undertaking on the part of the seller that he has a right to sell the goods (§ 12). Secondly, if goods be ordered by description, they must correspond with that description (§ 13). This, of course, is a universal rule—*Si æs pro auro veneat, non valet.* Thirdly, there is the case of manufacturers or sellers who deal in particular classes of goods. They naturally have better means of judging of their merchandise than the outside public, and the buyer is entitled within limits to rely on their skill or judgment. A tea merchant or grocer knows more about tea than his customers can, and so does a gunsmith about guns. In such cases, if the buyer makes known to the seller the particular purpose for which the goods are required, there is an implied condition that the goods are reasonably fit for it, and if no particular purpose be indicated there is an implied condition that the goods supplied are of merchantable quality (§ 14). Fourthly, in the case of a sale by sample, there is "an implied condition that the bulk shall correspond with the sample in quality," and that the buyer shall have a reasonable opportunity of comparing the bulk with the sample (§ 15).

Effects of contract.

The main object of sale is the transfer of ownership from seller to buyer, and it is often both a difficult and an important matter to determine the precise moment at which the change of ownership is effected. According to Roman law, which is still the foundation of most Continental systems, the property in a thing sold did not pass until delivery to the buyer. *Traditionibus et usucapionibus dominia rerum, non nudis pactis, transferuntur.* English law has abandoned this test, and has adopted the principle that the property passes at such time as the parties intend it to pass. Express stipulations as to the time when the property is to pass are very rare. The intention of the parties has to be gathered from their conduct. A long train of judicial decisions has worked out a more or less artificial series of rules for determining the presumed intention of the parties, and these rules are embodied in sections 16 to 20 of the Act. The first rule is a negative one. In the case of unascertained goods, *i.e.*, goods defined by description only, and not specifically identified, "no property in the goods is transferred to the buyer unless and until the goods are ascertained." If a man orders ten tons of scrap iron from a dealer, it is obvious that the dealer can fulfil his contract by delivering any ten tons of scrap that he may select, and that until the ten tons have been set apart, no question of change of ownership can arise. But when a specific article is bought, or when goods ordered by description are appropriated to the contract, the passing of the property is a question of intention. Delivery to the buyer is strong evidence of intention to change the ownership, but it is not conclusive. Goods may be delivered to the buyer on approval, or for sale or return. Delivery to a carrier for the buyer operates in the main as a delivery to the buyer, but the seller may deliver to the carrier, and yet reserve to himself a right of disposal. On the other hand, when there is a sale of a specific article, which is in a fit state for delivery, the property in the article *primâ facie* passes at once, even though delivery be delayed. When the contract is for the sale of unascertained goods, which are ordered by description, the property in the goods passes to the buyer, when, with the express or implied consent of the parties, goods of the required description are "unconditionally appropriated to the contract." The cases which determine what amounts to an appropriation of goods to the contract are numerous and complicated. Probably they could all be explained as cases of constructive delivery, but at the time when the law of appropriation was worked out the doctrine of constructive delivery was not known. It is perhaps to be regretted that the codifying Act did not adopt the test of delivery, but it was thought better to adhere to the familiar phraseology of the cases Section 20 deals with the transfer of risk from seller to buyer, and lays down the *primâ facie* rule that "the goods remain at the seller's risk until the property therein is transferred to the buyer, but when the property therein is transferred to the buyer, the goods are at the buyer's risk whether delivery has been made or not." *Res perit domino* is therefore the maxim of English, as well as of Roman law.

Title.

In the vast majority of cases people only sell what they have a right to sell, but the law has to make provision for cases where a man sells goods which he is not entitled to sell. An agent may misconceive or exceed his authority. Stolen goods may be passed from buyer to buyer. Then comes the question, Which of two innocent parties is to suffer? Is the original owner to be permanently deprived of his property, or is the loss to fall on the innocent purchaser? Roman law threw the loss on the buyer, *Nemo plus juris in alium transferre potest quam ipse habit.* French law, in deference to modern commerce, protects the innocent purchaser and throws the loss on the original owner. "En fait de meubles, possession vaut titre" (*Code Civil*, art. 1599). English law is a compromise between these opposing theories. It adopts the Roman rule as its guiding principle, but qualifies it with certain more or less arbitrary exceptions, which cover perhaps the majority of the actual cases which occur (§§ 21 to 26). In the first place, the provisions of the Factors Act, 1889 (52 and 53 Vict. c. 45, extended to Scotland by 53 and 54 Vict. c. 40), are preserved. That Act validates sales and other dispositions of goods by mercantile agents acting within the apparent scope of their authority, and also protects innocent purchasers who obtain goods from sellers left in possession, or from intending buyers who have got possession of the goods while negotiations are pending. In most cases a contract induced by fraud is voidable only, and not void, and the Act provides, accordingly, that a voidable contract of sale shall not be avoided to the prejudice of an innocent purchaser. The ancient privilege of market overt is preserved intact, and section 22 provides that "where goods are sold in market overt, according to the usage of the market, the buyer acquires a good title to the goods provided he buys them in good faith, and without notice of any defect or want of title on the part of the seller." The section does not apply to Scotland, nor to the law relating to the sale of horses which is contained in two old statutes, 2 and 3 Phil. and Mar. c. 7, and 31 Eliz. c. 12. The minute regulations of those statutes are never complied with, so their practical effect is to take horses out of the category of things which can be sold in market overt. The privilege of market overt applies only to markets by prescription, and does not attach to newly-created markets. The operation of the custom is therefore fitful and capricious. For example, every shop in the City of London is within the custom, but the custom does not extend to the greater London outside. If then a man buys a stolen watch in Fleet Street, he may get a good title to it, but he cannot do so if he buys it a few doors off in the Strand. There is, however, a qualification of the rights acquired by purchase even in market overt. When goods have been stolen and the thief is prosecuted to conviction, the property in the goods thereupon revests in the original owner, and he is entitled

to get them back either by a summary order of the convicting court or by action. This rule dates back to the statute 21 Hen. VIII. c. 11. It was probably intended rather to encourage prosecutions in the interests of public justice than to protect people whose goods were stolen.

Having dealt with the effects of sale, first, as between seller and buyer, and, secondly, as between the buyer and third parties, the Act proceeds to determine what, in the absence of convention, are the reciprocal rights and duties of the parties in the performance of their contract (§§ 27 to 37). "It is the duty of the seller to deliver the goods and of the buyer to accept and pay for them in accordance with the terms of the contract of sale" (§ 27). In ordinary cases the seller's duty to deliver the goods is satisfied if he puts them at the disposal of the buyer at the place of sale. The normal contract of sale is represented by a cash sale in a shop. The buyer pays the price and takes away the goods: "Unless otherwise agreed, delivery of the goods and payment of the price are concurrent conditions" (§ 27). But agreement, express or implied, may create infinite variations on the normal contract. It is to be noted that when goods are sent to the buyer which he is entitled to reject, and does reject, he is not bound to send them back to the seller. It is sufficient if he intimate to the seller his refusal to accept them (§ 36).

Performance.

The normal theory of sale is cash against delivery, but in the great majority of actual cases, especially in commercial transactions, this theory is departed from in practice. The interests of the seller are therefore protected by two rules, namely, those as to lien and as to stoppage *in transitu*. In the absence of any different agreement, as for instance where there is a stipulation for sale on credit, the unpaid seller has a right to retain possession of the goods until the price is paid or tendered. The right may, of course, be waived, even when it is not negatived by the contract. It is to be noted that when the seller takes a bill of exchange or other negotiable instrument for the price, the instrument operates as conditional payment. On the dishonour of the instrument the seller's rights revive (§§ 38–43). If the buyer becomes insolvent the unpaid seller has a further right founded on ancient mercantile usage. He may have parted with both the property in and possession of the goods sold, but he can attach the goods as long as they are in the hands of a carrier or forwarding agent, and have not reached the actual possession of the seller or his immediate agent. "Subject to the provisions of this Act, when the buyer of goods becomes insolvent, the unpaid seller who has parted with the possession of the goods has the right of stopping them *in transitu*, that is to say, he may resume possession of the goods as long as they are in course of transit, and may retain them until payment or tender of the price" (§ 44). The right of stoppage, however, cannot be exercised to the prejudice of third parties to whom the bill of lading or other document of title to goods has been lawfully transferred for value (§ 47).

Rights of unpaid sellers.

The ultimate sanction of a contract is the legal remedy for its breach. Seller and buyer have each their appropriate remedies. If the property in the goods has passed to the buyer, or if, under the contract, "the price is payable on a day certain irrespective of delivery," the seller's remedy for breach of the contract is an action for the price (§ 49). In other cases his remedy is an action for damages for non-acceptance. In the case of ordinary goods of commerce the measure of damages is the difference between the contract price and the market or current price at the time when the goods ought to have been accepted. But this test is often applicable. For instance, the buyer may have ordered some article of special manufacture for which there would be no market. The convenient market-price rule is therefore subordinate to the general principle that "the measure of damages is the estimated loss directly and naturally resulting in the ordinary course of events from the buyer's breach of contract" (§ 56). Similar considerations apply to the buyer's right of action for non-delivery of the goods (§ 51). Section 52 deals with a peculiar feature of English law. In Scotland, as a general rule, a party who complains of a breach of contract is entitled to claim that the contract shall be specifically performed. In England a court of common law could only award damages, and apart from certain recent statutes, a claim for specific performance could only be entertained by a court of equity in a very narrow class of cases when the remedy by damages was deemed inadequate. But now, under the Act of 1893, "in any action for breach of contract to deliver specific or ascertained goods the court may, if it thinks fit, direct that the contract shall be performed specifically without giving the defendant the option of retaining the goods on payment of damages." The buyer who complains of a breach of warranty on the part of the seller has two remedies. He may either set up the breach of warranty in reduction of the price, or he may pay the price and sue for damages. The *primâ facie* measure of damages is the difference between the value of the goods at the time of delivery and the value they would have had if they had answered to the warranty (§ 53).

Remedies of buyer and seller.

The sixth part of the Act is supplemental, and is mainly concerned with drafting explanations, but section 58 contains some rules for regulating sales by auction. It prohibits secret bidding on behalf of the seller to enhance the price, but is silent as to combination by buyers to reduce the price. Such a combination, commonly known as a "knock out," is left to be dealt with by the ordinary law of conspiracy.

The Sale of Goods Act, 1893, was the third attempt made by Parliament to codify a branch of commercial law. It would be out of place here to discuss the policy of mercantile codification, but it may be noted that there are very few reported cases on the construction of the Act, so that its interpretation does not seem to have given rise to difficulty. As has been noted above, the Act preserves some curious anomalies and distinctions between English and Scottish law. But the amendments required to remove them would be few and simple, should the Legislature ever think it worth while to undertake the task.

The ordinary text-books on the law of sale are constantly re-edited and brought up to date. The following among the others may be consulted:—BENJAMIN'S *Sale of Personal Property*; BLACKBURN'S *Contract of Sale*; CAMPBELL'S *Law of Sale and Mercantile Agency*; BROWN'S *Sale of Goods Act (Scotland)*; CHALMERS'S *Sale of Goods Act*; MOYLE'S *Contract of Sale in the Civil Law*; BEDDARRIDE'S *Des Achats et Ventes Commerciales*; STORY'S *Sale of Personal Property* (United States). (M. D. CH.)

Salem, a city and district of British India, in the Madras presidency. The city is on both banks of the river Tirumanimuttar; 3 miles from a station on the Madras Railway, 207 miles south-west of Madras. Population (1881), 50,667; (1891), 67,710, showing an increase of 34 per cent.; (1901), 70,627. Municipal income (1897–98), Rs.80,530. There is considerable weaving industry and some cutlery, and a London mission. The municipal college had 19 students in 1896–97, and the 2 municipal and mission high schools had 471 pupils. There are three printing-presses, one of which issues the district gazette, and 4 reading-rooms and literary associations.

The district has an area of 7529 square miles; population (1881), 1,592,915; (1891), 1,962,591; (1901), 2,205,898, showing an increase of 23 per cent. in the earlier, and 12 per cent. in the

later decade; average density, 261 persons per square mile. The land revenue and rates in 1897–98 were Rs.28,09,847, the incidence of assessment being R.1.6.1 per acre; cultivated area, 1,287,329 acres, of which 169,166 were irrigated from tanks, wells, &c., including 26,534 from Government works; number of police, 1133; boys at school (1896–97), 29,030, being 20 per cent. of the male population of school-going age; registered death-rate (1897), 19·3 per thousand. The principal crops are millet, *ragi*, rice, other food grains, and oil seeds, with a little cotton, indigo, and tobacco. Coffee is grown on 11,271 acres in the Shevaroy Hills. The chief irrigation work is the Barur tank system, on which the capital outlay has been Rs.4,25,025. In 1897–98 the area irrigated was 4421 acres; and the receipts were Rs.9774, compared with an expenditure of Rs.19,939. Salem suffered very severely from the famine of 1877–78. The Madras Railway runs through the district for 131 miles. The chief industry is cotton-weaving, and there is some manufacture of steel. There are 141 saltpetre refineries, but no large industries.

Salem, a city and seaport of Massachusetts, U.S.A., capital of Essex county. It is on the north coast of Massachusetts Bay, in the north-eastern part of the state, and on a line of the Boston and Maine Railroad, by which it is connected with Boston, 15 miles to the south-west. It is situated on a rocky peninsula, has a very irregular street plan, is divided into six wards, has an excellent water-supply pumped from Wenham Lake, four miles distant, and is sewered. The business streets are paved with granite blocks, the residential streets macadamized or gravelled. Salem, once famous as a commercial city and the home port of many sailing vessels engaged in foreign commerce, is now an important manufacturing city. In 1900 there were 446 manufacturing establishments, with a total capital of $7,450,935. They employed 6424 hands, and the product had a value of $12,257,449. Of this not less than $2,974,631, or almost one quarter, consisted of boots and shoes, and $3,076,869 consisted of leather. In 1900 the assessed valuation of real and personal property was $27,876,291, the net debt of the city was but $864,169, and the rate of taxation was $18.00 per $1000. The income of the city, exclusive of loans, was $765,979, and the expenditure for maintenance and operation, $620,552. Population (1890), 30,801; (1900), 35,956, of whom 10,902 were foreign-born and 156 negroes.

Salem, a city of New Jersey, U.S.A., capital of Salem county, on the river Salem, at the mouth of Fenwick Creek, and on the West Jersey and Seashore Railroad, in the south-western part of the state. Its site is low and level, the street plan is irregular, and the city is divided into east and west wards. It is in a rich fruit-growing region, and the town has some manufactures of varied character. Population (1890), 5516; (1900), 5811, of whom 263 were foreign-born and 809 negroes.

Salem, a city of Columbiana county, Ohio, U.S.A. It is on the Pennsylvania Railroad, in the eastern part of the state, at an altitude of 1172 feet. It has varied manufactures, consisting mainly of highly manufactured articles of iron and steel. Population (1890), 5780; (1900), 7582, of whom 677 were foreign-born and 227 negroes.

Salem, a city of Oregon, U.S.A., capital of Marion county and of the state. It is on the river Willamette, and on the Southern Pacific Railroad, in the north-western part of the state, at an altitude of 195 feet. It has broad streets, and a water-supply from the river Santiam. Its manufactures are of a varied character. Willamette University, situated here, had in 1899 a faculty numbering 37, and was attended by 180 students, 68 of whom were women. Population (1890), 4515; (1900), 4258, of whom 522 were foreign-born.

Salerno, a seaport town, archiepiscopal see, and capital of the province of Salerno, Campania, Italy, on the north shore of the Gulf of Salerno, 33 miles by rail south-east of Naples. The chief industry is cotton-spinning and printing, with factories for leather-work, thread, linen, glass, pottery, tiles, macaroni, iron-works, and printing. Good wine is produced in the neighbourhood. There is a technical school. Population (1881), 24,275; (1901), 42,736.

Saleyer (Dutch, *Saleijer*), a group of islands belonging to the government of Celebes and its dependencies in the Dutch East Indies, numbering altogether 73, the principal being Saleyer, Tambalongang, Pulasi, and Bahuluwang; between 5° 36′ and 7° 25′ S. and 119° 50′ and 121° 30′ E. The main island, Saleyer, is 248 square miles in area. The strait separating it from Celebes is more than 100 fathoms deep and, running in a strong current, is dangerous for native ships to navigate. The east coast is very steep. On the west, the Bay of Bontobangun (988 acres) is protected by an island from the onset of the west winds. The strata of the island are all sedimentary rocks: coralline limestone, occasionally sandstone; everywhere, except in the north and north-west, covered by a fertile soil. The watershed (of inconsiderable rivers) is formed by a chain running the length of the island from north to south, reaching in Bontona Haru 5840 feet, sloping steeply to the east coast. There are no lakes or morasses. The island is densely populated, averaging 233 inhabitants per square mile. There are frequent emigrations to Celebes and other parts of the archipelago. For that reason, and also on account of its excellent horses and numerous buffaloes, Saleyer is often compared with Madura, being of the same importance to Celebes as is Madura to Java.

Salgó Tarján, an important mining town of Hungary, in the county of Nógrád, with 9478 inhabitants in 1891. In the coal-mines more than 3000 workmen are employed; the mines produce yearly about 10 million metric centners of coal. There is a special establishment for the workmen, having a hospital, baths, school, &c. There are also an iron-refinery and an iron-plate factory, with about 400 houses for workmen, together with several public institutions. Population (1901), 13,552.

Saliany, a district town of Russian Transcaucasia, in the government and 33 miles from the Adji–Kabul railway station (112 miles from Baku), on the river Kura, at the head of an island of same name. In 1897 its population was 10,168, chiefly Tatar. It is the centre of the fishing-grounds on the river Kura, the yearly revenue derived from which is 1,174,700 roubles; thousands of workers come together from all parts of Russia during the fishing season. Saliany was annexed to Russia in the 18th century, but was retaken by the Persians, and only became Russian finally in 1813. Five miles to the north are situated the ruins of Hershasib, the capital of the Shahs of Shirvan, destroyed by the Mongols in 1285.

Salina, a city of Kansas, U.S.A., capital of Saline county, on the river Smoky Hill, near the mouth of the Saline, and near the centre of the state, at an altitude of 1224 feet. It is situated in a fertile farming region, and has grain elevators and flour-mills, power being obtained from the river. It is the seat of Kansas Wesleyan University, a Methodist Episcopal institution, opened in 1886, which had in 1899 a faculty of 7 professors, and was attended by 79 students. Population (1890), 6149; (1900), 6074, of whom 579 were foreign-born and 356 negroes.

Salisbury, or New Sarum, a city, municipal and parliamentary borough (returning since 1885 only one member), and county town of Wiltshire, England, on the Avon, 83 miles west-south-west of London by rail. In recent years the cathedral tower and spire have undergone considerable repairs. The more important educational establishments comprise a theological college, a diocesan training school for elementary teachers, a school for boys, with numerous scholarships, a school of science and art, a school built by Bishop Wordsworth in 1889, used for technical instruction, and the Godolphin high-class school for girls. Modern erections are a county hall, a free library, and swimming baths. A Victoria Park of 16 acres was provided in 1887, when there was erected a statue of Henry Fawcett, a native of Salisbury. Area of municipal borough, 600 acres. Population (1881), 14,792; (1901), 17,117.

Salisbury, a city of North Carolina, U.S.A., capital of Rowan county. It is on the Southern Railway, in the "piedmont" region, west of the centre of the state. It is the seat of Livingstone College for negroes. Population (1890), 4418; (1900), 6277, of whom 69 were foreign-born and 2408 negroes.

Salisbury (*Rhodesia*). See Rhodesia (South).

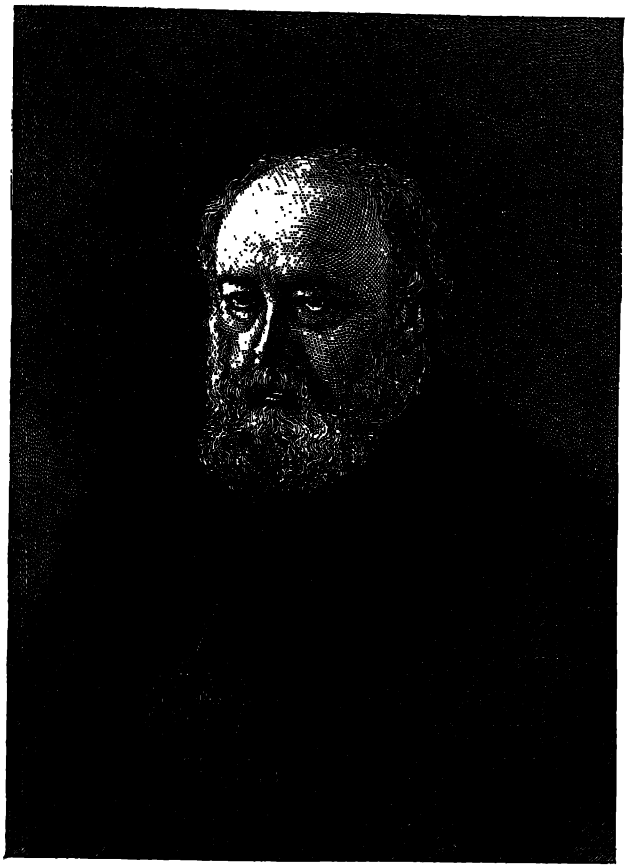
Salisbury, Robert Arthur Talbot Gascoyne-Cecil, 3rd Marquis of, (1830-——), British statesman, second son of James, 2nd marquis (Lord Privy Seal 1852, Lord President of Council 1858) by his first wife, Frances Mary Gascoyne, was born at Hatfield on 3rd February 1830, and was educated at Eton and Christ Church, Oxford, where he took his degree in 1850. At Oxford he was an active member of the Union Debating Society, and filled the office of treasurer. The first few years after leaving the university were spent by Lord Robert Cecil (as he then was) in travel, as far afield as New Zealand; but in 1853 he was returned unopposed to the House of Commons as Conservative member for Stamford, being elected in the same year a fellow of All Souls. He made his maiden speech in Parliament on 7th April 1854, in opposition to Lord John Russell's Oxford University Bill. The speech was marked by scepticism as to the utility of reforms, and Lord Robert prophesied that if the wishes of founders were disregarded, nobody would in future care to found anything. Fifteen months later he was chosen by his party to second "the previous question" in the debate on Mr Roebuck's vote of no confidence in Lord Palmerston's Government. In 1857 he appeared as the author of his first Bill—for establishing the voting-paper system at parliamentary elections; and in the same year he married Georgina Caroline, daughter of Sir Edward Holt Alderson, a baron of the Court of Exchequer, a large share of whose great intellectual abilities she inherited. From that time Lord Robert Cecil continued to be active not only in politics, but, for several years, in journalism, the income he earned by his pen being then a matter of pecuniary importance to him. One of his contemporaries at Oxford had been Thomas Hamber of Oriel, who became editor of the *Standard*, and during these years Cecil was an occasional contributor of "leaders" to that paper. He also contributed to the *Saturday Review*, founded in 1855 by his brother-in-law Beresford Hope, and edited by his friend Douglas Cook; not infrequently he wrote for the *Quarterly* (where, in 1867, he was to publish his famous article on "the Conservative Surrender"); and in 1858 he contributed to *Oxford Essays* a paper on "The Theories of Parliamentary Reform," giving expression to the more intellectual and aristocratic antagonism to doctrinaire Liberal views on the subject, while admitting the existence of many anomalies in the existing electoral system. In February of the next year, when the question was taken up by the Conservative Government, and Disraeli introduced his Reform Bill with its "fancy franchises," the member for Stamford was prominent among its critics from the Tory point of view. During the seven years that followed, Lord Robert was always ready to defend the Church, or the higher interests of Conservatism and property; and his speeches then, not less than later, showed a caustic quality and a tendency to what became known as "blazing indiscretions." For example, when the repeal of the paper duty was being discussed in 1861, he asked whether it "could be maintained that a person of any education could learn anything worth knowing from a penny paper"—a question the answer to which has been given by the powerful, highly organized, and admirable Conservative penny press of a subsequent day. A little later he declared the proceedings of the Government "more worthy of an attorney than of a statesman"; and on being rebuked, apologized—to the attorneys. He also charged Lord John Russell with adopting "a sort of tariff of insolence" in his dealings with foreign Powers, strong and weak.

Early years in Parliament.

It was not, however, till the death of Lord Palmerston and the removal of Lord John Russell to the House of Lords had brought Mr Gladstone to the front, that Lord Robert Cecil — who became Lord Cranborne by the death of his elder brother on 14th June 1865—began to be accepted as a politician of the first rank. His emergence coincided with the opening of the new area in English politics, ushered in by the practical steps taken to extend the parliamentary franchise. On 12th March 1866 Mr Gladstone brought forward his measure to establish a £7 franchise in boroughs and a £14 franchise in counties, which were calculated to add 400,000 voters to the existing lists. Lord Cranborne met the Bill with a persistent opposition, his rigorous logic and merciless hostility to clap-trap tending strongly to reinforce the impassioned eloquence of Mr Lowe. But though he attacked the Government Bill both in principle and detail, he did not absolutely commit himself to a position of hostility to Reform of every kind; and on the defeat of Mr Gladstone's Ministry, no surprise was expressed at his joining the Cabinet of Lord Derby as secretary of state for India, even when it became known that a settlement of the Reform question was part of the Tory programme. The early months of the new Government's tenure were marked by the incident of the Hyde Park riots; and whether or not the fall of the Park railings determined the question of Reform, it is at least certain that if there had been members of the Cabinet and party who believed up to that time that the Reform question was not urgent, the action of the Reform League and the London populace forced them to a different conclusion. On 11th February Mr Disraeli informed the House of Commons that the Government intended to ask its assent to a series of thirteen resolutions; but when, on 26th February, the Liberal leaders decided to oppose them and to demand that the Government should produce a Bill, Mr Disraeli at once consented to do so. The introduction of a Bill was, however, delayed by the resignation of Lord Cranborne, General Peel, and Lord Carnarvon. The Cabinet had been considering two alternative measures, widely different in kind and extent, and the final decision between the two was taken in ten minutes (whence the nickname of the "Ten Minutes Bill") at an informal gathering of the Cabinet held just before Lord Derby was engaged to address a general meeting

Cabinet minister: the Franchise Question: resignation 1867.

of the party. At a Cabinet council, held on 23rd February, measure A had been agreed upon, the three doubtful ministers having been persuaded that the checks and safeguards provided were sufficient; in the interval between Saturday and Monday they had looked more closely into the statistics, and had come to the conclusion that the checks were inadequate; on Monday morning they had gone to Lord Derby and told him so; at two o'clock the rest of the Cabinet, hastily summoned, had been informed of the new situation, and had there and then, before the meeting at half-past two, agreed, in order to retain their three colleagues, to throw over measure A, and to present measure B to the country as the fruit of their matured and unanimous wisdom. Lord Derby at the meeting, and Mr Disraeli a few hours later in the House of Commons, explained their new measure—a measure based upon a £6 franchise; but their own side did not like it, the Opposition were furious, and the moral sense of the country was revolted by the undisguised adoption of almost the very Bill which the Conservatives had refused to accept from their opponents only a year before. The result was that the Bill was never introduced; the Government reverted to measure A, and the three ministers again handed in their resignations. In the debate on the third reading of the Bill, when its passage through the House of Commons without a division was assured, Lord Cranborne showed with caustic rhetoric how the "precautions, guarantees, and securities" with which the Bill had bristled on its second reading had been dropped one after another at the bidding of Mr Gladstone.



THE MARQUIS OF SALISBURY.
(*From a photo by Elliott and Fry, London.*)

In countries where politics are conducted on any other than the give-and-take principles in vogue in England, such a breach as that which occurred in 1867 between Lord Cranborne and his former colleagues, especially Mr Disraeli, would have been beyond repair. But, Lord Cranborne, though an aristocrat both by birth and by conviction, was not impracticable; moreover, Mr Disraeli, who had himself risen to eminence through invective, admired rather than resented that gift in others; and their common opposition to Mr Gladstone was certain to reunite the two colleagues. Nothing of great moment occurred during the session of 1868. Everybody was content to look forward to the new elections in the autumn. But although no legislation of great moment was attempted, Mr Gladstone was not afraid to show his hand, and to announce that he meant to take up the Irish question, and to deal especially with the celebrated "Upas tree," of which the first branch was the Established Church. By way of giving full notice to the electorate, he brought in a series of resolutions on this question; and though the attitude adopted by the official Conservatives towards them was not one of serious antagonism, Lord Cranborne vigorously attacked them, and declared himself altogether in favour of upholding the Establishment. This was his last speech in the House of Commons, for on 12th April his father died, and he became 3rd marquis of Salisbury.

In the House of Lords.

In the House of Lords the new Lord Salisbury's style of eloquence — terse, incisive, and wholly free from false ornament—found an even more appreciative audience than it had met with in the House of Commons. The questions with which he was first called upon to deal were questions in which his interest was keen—the recommendations of the Ritual Commission and, some time later, the Irish Church Suspensory Bill. Lord Salisbury's argument, with which the Lords readily agreed, was that the last session of an expiring Parliament was not the time in which so grave a matter as the Irish Church Establishment should be judged or prejudged; that a Suspensory Bill involved the question of disestablishment; and that such a principle could not be accepted by the Lords until the country had been appealed to upon it and had pronounced decisively in its favour. Even then there were those who raised the cry that the only business of the House of Lords was to register the decisions of the Commons, and that if they refused to do so it was at their peril. Lord Salisbury met this cry boldly and firmly:—

> "When the opinion of your countrymen has declared itself, and you see that their convictions—their firm, deliberate, sustained convictions—are in favour of any course, I do not for a moment deny that it is your duty to yield."

In the very next session Lord Salisbury was called upon to put his view into practice, and his influence went far to persuade the peers to pass the Irish Church Disestablishment Bill. In his opinion the general election of the autumn of 1868 had been fought on this question; his friends had lost, and there was nothing for them to do but to bow to the necessities of the situation. The story of his conduct in the matter has been told in some fulness in the *Life* of Archbishop Tait, with whom Lord Salisbury acted, and who throughout those critical weeks played a most important part as mediator between the two extreme parties—those of Lord Cairns (representing Ulster) and Mr Gladstone. October 1869 saw the death of the old Lord Derby, who was still the titular leader of his party; and he was succeeded as leader of the House of Lords by Lord Cairns. For the dignified post of chancellor of the university of Oxford, Convocation unanimously chose as Lord Derby's successor the marquis of Salisbury. Lord Derby had translated the *Iliad* very well, but his successor was far more able to sympathize with the academic mind and temper. Lord Salisbury was at heart a student, and found his best satisfaction in scientific

research and in scientific speculation; while still a young man he had made useful contributions to the investigation of the flora of Hertfordshire, and at Hatfield he had his own laboratory, where he was able to satisfy his interest in chemical and electrical research. As regards his connexion with Oxford may be mentioned, in particular, his appointment, in 1877, of a second University Commission, and his appearance, in September 1894, in the Sheldonian Theatre as president of the British Association.

It is not necessary to dwell at any length upon the part taken by Lord Salisbury between 1869 and 1873 in respect of the other great political measures of Mr Gladstone's Government—the Irish Land Act, the Act Abolishing Purchase in the Army, Mr Forster's Education Act, &c. Nor does his attitude towards the Franco-German War of 1870–71 call for any remark; an English leader of Opposition is bound, even more than a minister, to preserve a discreet silence on such occasions. But early in 1874 came the dissolution, suddenly announced in the famous Greenwich letter of Mr Gladstone, with the promise of the abolition of the income tax. For the first time since 1841 the Conservatives found themselves in office with a large majority in the House of Commons. In Mr Disraeli's new Cabinet in 1874 Lord Salisbury accepted his old position at the India Office. The first task with which the new secretary of state had to deal was one of those periodical famines which are the great scourge of India; he supported the action of Lord Northbrook, the viceroy, and refused to interfere with private trade by prohibiting the export of grain. This attitude was amply justified, and Lord Salisbury presently declared that the action of the Government had given so much confidence to private traders that, by their means, "grain was pouring into the distressed districts at a greater rate than that which was being carried by the public agency, the amount reaching nearly 2000 tons a day." The Public Worship Regulation Bill of 1874 was the occasion of a famous passage of arms between Lord Salisbury and his chief. The Commons had inserted an amendment which, on consideration by the lords, Lord Salisbury opposed, with the remark that it was not for the peers to attend to the "bluster" of the lower House merely because a small majority there had passed the amendment. The new clause was accordingly rejected, and the Commons eventually accepted the situation; but Disraeli, banteringly criticizing Lord Salisbury's use of the word "bluster," alluded to him as "a man who does not measure his phrases. He is one who is a great master of gibes and flouts and jeers."

Disraeli Cabinet of 1874.

From the middle of 1876 the Government was occupied with foreign affairs. In regard to the stages of Eastern fever through which England passed between the occurrence of the Bulgarian "atrocities" and the signature of the Treaty of Berlin, the part played by Lord Salisbury was considerable. The excesses of the Bashi-Bazouks took place in the early summer of 1876, and were recorded in long and highly-coloured despatches to English newspapers; presently there followed Mr Gladstone's pamphlet on *Bulgarian Horrors*, his speech on Blackheath, and his enunciation of a "bag and baggage" policy towards Turkey. The autumn went by, Servia and Montenegro declared war upon Turkey and were in imminent danger of something like extinction. On 31st October Russia officially interfered and demanded an armistice, which Turkey granted; and England immediately proposed a conference at Constantinople, at which the Powers should endeavour to make arrangements with Turkey for a general pacification of her provinces and of the inflammable communities adjoining. At this conference England was represented by Lord Salisbury. It met early in December, taking for its basis the English terms, namely, the *status quo ante* in Servia and Montenegro; a self-denying ordinance on the part of all the Powers; and the independence and territorial integrity of the Ottoman empire, together with large administrative reforms assured by guarantees. General Ignatieff, the Russian ambassador, was effusively friendly with the English envoy; but though the philo-Turkish party in England professed themselves scandalized, it is certain that Lord Salisbury made no improper concessions to the schemes of Russia, and departed in no way from his instructions and from the agreed policy of the British Cabinet. On 20th January the conference broke up, Turkey having declared its recommendations inadmissible; and Europe withdrew to await the inevitable declaration of war. Very early in the course of that war the intentions of England were clearly indicated in a despatch of Lord Derby to the British representative at St Petersburg, which announced that so long as the struggle concerned Turkish interests alone Great Britain would be neutral, but that such matters as Egypt, the Suez Canal, the regulations affecting the passage of the Dardanelles, and the possession of Constantinople itself would be regarded as matters to which she could not be indifferent. The war went on, and for some nine months none of these British interests appeared to be threatened, nor had Lord Salisbury's own department to concern itself very directly with the progress of the belligerents. Once or twice, indeed, the Indian secretary committed himself to statements which laid him open to a good deal of attack, as when he rebuked an alarmist by bidding him study the Central Asian question "in large maps." But with the advance of Russia through Bulgaria and across the Balkans, English anxiety grew. In mid-December explanations were asked from the Russian Government as to their intentions with regard to Constantinople. On 23rd January the Cabinet ordered the fleet to sail to the Dardanelles. Lord Carnarvon resigned, and Lord Derby handed in his resignation, but withdrew it. The Treaty of San Stefano was signed on 3rd March; and three weeks later, when its full text became known, the Cabinet met and decided upon measures which finally induced Lord Derby, at the end of the month, to retire from the Foreign Office, his place being immediately filled by Lord Salisbury. The new foreign secretary at once issued the famous "Salisbury circular" to the British representatives abroad, which appeared in the newspapers on 2nd April. This elaborate and dignified State paper was at once a clear exposition of British policy, and practically an invitation to Russia to reopen the negotiations for a European congress. These negotiations, indeed, had been proceeding for several weeks past; but Russia having declared that she would only discuss such points as she pleased, the British Cabinet had withdrawn, and the matter for the time was at an end. The bulk of the document consisted of an examination of the Treaty of San Stefano and its probable effects, Lord Salisbury justifying such an examination on the ground that as the position of Turkey and the other countries affected had been settled by Europe in the Treaty of Paris in 1856, the Powers which signed that treaty had the right and the duty to see that no modifications of it should be made without their consent.

The Eastern Question.

Succeeds Lord Derby as foreign minister.

The effect of the circular was great and immediate. At home the Conservatives were encouraged, and many moderate Liberals rallied to the Eastern policy of the Government. Abroad it seemed as if the era of divided councils was over, and the Russian Government promptly recognized that the circular meant either a congress or war with England. For the latter alternative it was by no means prepared, and very soon negotiations were reopened, which led to the meeting of the congress at Berlin on

13th June. The history of that famous gathering and of its results is narrated under EUROPE. Lord Beaconsfield on two or three subsequent occasions referred to the important part that his colleague had played in the negotiations, and he was not using merely the language of politeness. Rumours had appeared in the London press as to a supposed Anglo-Russian agreement that had been signed between Lord Salisbury and the Russian ambassador, Count Shuvaloff, and these rumours or statements were described by the foreign secretary in the House of Lords, just before he left for Berlin, as "wholly unauthentic." But on 14th June what purported to be the full text of the agreement was published by the *Globe* newspaper through a certain Charles Marvin, at that time employed in occasional transcribing work at the Foreign Office, and afterwards known by some strongly anti-Russian books on the Central Asian question. Marvin was prosecuted, but the law as it then was could not touch him for his breach of confidence, and it was only by a subsequent Act of Parliament that such conduct was made penal. Besides the general inconvenience of the disclosure, the agreement, which stipulated that Batum and Kars might be annexed by Russia, made it impossible for the congress to insist upon Russia entirely withdrawing her claim to Batum, though at the time of the meeting of the congress it was known to some of the negotiators that she was not unwilling to do so. In one respect Lord Salisbury's action at the congress was unsuccessful. Much as he disliked the sentimentalism of Mr Gladstone, he was not without a certain sentimentalism of his own, and at the Berlin Congress this took the form of an unexpected and, as it happened, useless pushing of the claims of Greece. But in the main Lord Salisbury must be held to deserve, almost equally with his great colleague, the credit for the Berlin settlement. Great, however, as was the work done at Berlin, and marked the relief to all Europe which was caused by the signing of the treaty, much work, and of no pleasant kind, remained for the British Foreign Office and for the Indian Government before the Beaconsfield Parliament ended and the Government had to render up its accounts to the nation. Russia, foreseeing a possible war with England, had during the spring of 1878 redoubled her activity in Central Asia, and almost at the very time that the treaty was being signed, her mission was received at Kabul by the Amir Sher Ali. Out of the Amir's refusal to receive a counterbalancing British mission there grew the Afghan war; and though he had ceased to control the India Office, Lord Salisbury was naturally held responsible for some of the preliminary steps which, in the judgment of the Opposition, had led to these hostilities. But Lord Granville and his friends entirely failed to fix upon Lord Salisbury the blame for a series of events which, considering the action of Russia, the personal disposition of Sher Ali, and the excited nature of the frontier tribes, was generally seen to be inevitable. A defence of the foreign policy of the Government during the year which followed the Berlin Treaty was made by Lord Salisbury in a speech at Manchester (October 1879), which had a great effect throughout Europe. In it he justified the occupation of Cyprus, and approved the beginnings of a league of central Europe for preserving peace.

At Berlin Congress.

In the spring of 1880 the general election overthrew Lord Beaconsfield's Government and replaced Mr Gladstone in power, and the country entered upon five eventful years, which were to see the consolidation of the Parnellite party, the reign of outrage in Ireland, disasters in Zululand and the Transvaal, war in Egypt, a succession of costly mistakes in the Sudan, and the final collapse of Mr Gladstone's Government on a trifling Budget question. The defeat of 1880 greatly depressed Lord Beaconsfield, who till then had really believed in that "hyperborean" theory upon which he had acted in 1867—the theory that beyond and below the region of democratic storm and violence was to be found a region of peaceful conservatism and of a dislike of change. After the rude awakening of April 1880 Lord Beaconsfield seems to have lost heart and hope, and to have ceased to believe that wealth, birth, and education would count for much in future in England. Lord Salisbury, who on Lord Beaconsfield's death a year later was chosen, after the claims of Lord Cairns had been withdrawn, as leader of the Conservative peers (Sir Stafford Northcote continuing to lead the Opposition in the lower House), was not so disposed to counsels of despair. After the Conservative reaction had come in 1886, he was often taunted with pessimism as regards the results, and he certainly spoke on more than one occasion in a way which appeared to justify the caricatures which appeared of him in the Radical press in his character of Hamlet; but in the days of Liberal ascendancy Lord Salisbury was confident that the tide would turn. We may pass briefly over the years of Opposition between 1880 and 1885; the only policy that could then wisely be followed by the Conservative leaders was that of giving their opponents sufficient rope. In 1884 a new Reform Bill was introduced, extending household suffrage to the counties; this was met in the Lords by a resolution, moved by Lord Cairns, that the peers could not pass it unaccompanied by a Redistribution Bill. The Government, therefore, withdrew their measure. In the summer and autumn there was a good deal of agitation; but in November a redistribution scheme was settled between the leaders of both parties, and the Bill passed. When, in the summer of 1885, Mr Gladstone resigned, it became necessary for the country to know whether Lord Salisbury or Sir Stafford Northcote was the real Conservative leader; and the Queen settled the matter by at once sending for Lord Salisbury, who became prime minister for the first time in 1885.

Leader of Conservative party.

The "Forwards" among the Conservatives, headed by Lord Randolph Churchill, brought so much pressure to bear that Sir Stafford Northcote was induced to enter the House of Lords as earl of Iddesleigh, while Sir Michael Hicks Beach was made leader of the House of Commons, Lord Randolph Churchill secretary for India, and Mr Arthur Balfour president of the Local Government Board. The new Government had only to prepare for the general election in the autumn. The ministerial programme was put forward by Lord Salisbury on 7th October in an important speech addressed to the Union of Conservative Associations assembled at Newport, in Monmouthshire; and in this he outlined large reforms in local government, poured scorn upon Mr Chamberlain's Radical policy of "three acres and a cow," but promised cheap land transfer, and opposed the disestablishment of the Church as a matter of life or death to the Conservative party. In this Lord Salisbury was declaring war against what seemed to be the danger should Mr Chamberlain's "unauthorized programme" succeed; while the comparative slightness of his references to Ireland showed that he had no more suspicion than anybody else of the event which was about to change the whole face of English politics, to break up the Liberal party, and to change the most formidable of the advanced Radicals into an ally and a colleague. The general election took place, and there were returned to Parliament 335 Liberals, 249 Conservatives, and 86 Home Rulers; so that if the last two parties had combined, they would have exactly tied with the Liberals. The Conservative Government met Parliament, and after a short time were put into a minority of 79 on a Radical

Prime minister, 1885.

land motion, brought in by Mr Chamberlain's henchman, Mr Jesse Collings. Mr Gladstone's return to office, and his announcement of a Bill giving a separate Parliament to Ireland, were quickly followed by a great meeting at Her Majesty's Theatre, at which Lord Salisbury, Lord Hartington, Mr Goschen, and some Radical members met on the same platform; the secession of the Unionist Liberals; the defeat of the Bill; an appeal to the country; and the return of the Unionist party to power with a majority of 118. Lord Salisbury at once offered to make way for Lord Hartington, but the suggestion that the latter should form a Government was declined; and the Conservatives took office alone, with an Irish policy which might be summed up, perhaps, in Lord Salisbury's words as "twenty years of resolute government." For a few months, until just before his sudden death on 12th January 1887, Lord Iddesleigh was foreign secretary; but Lord Salisbury, who meanwhile had held the post of lord privy seal, then returned to the Foreign Office. Meanwhile the increasing friction between him and Lord Randolph Churchill, who, amid many qualms on the part of more old-fashioned Conservatives, had become chancellor of the exchequer and leader of the House of Commons, had led to the latter's resignation, which, to his own surprise, was accepted; and from that date Lord Salisbury's effective primacy in his own party was unchallenged.

Unionism: Prime minister, 1886.

Only the general lines of Lord Salisbury's later political career need here be sketched. As a consequence of the practical monopoly of political power enjoyed by the Unionist party after the Liberal disruption of 1886—for even in the years 1892–95 the situation was dominated by the permanent Unionist majority in the House of Lords—Lord Salisbury's position became unique. These were the long-looked-for days of Conservative reaction, of which he had never despaired. The situation was, of course, complicated, so far as Lord Salisbury personally was concerned, by the coalition with the Liberal Unionists, which was confirmed in 1895 by the inclusion of the duke of Devonshire, Mr Chamberlain, and other Liberal Unionists in the Cabinet. But though it appeared anomalous that old antagonists like Lord Salisbury and Mr Chamberlain should be working together in the same ministry, the prime minister's position was such that he could disregard a superficial criticism which paid too little heed to his political faculty and his patriotic regard for the requirements of the situation. Moreover, the practical work of reconciling Conservative traditions with domestic reform depended rather on Lord Salisbury's nephew, Mr Balfour, who led the House of Commons, than on Lord Salisbury, who devoted himself almost entirely to foreign affairs. The new Conservative movement, moreover, in the country at large, was, in any case, of a more constructive type than Lord Salisbury himself was best fitted to lead, and though he was necessarily prime minister and was deeply respected both for his character and his past work, he was not the real source of the political inspiration even of the Conservative wing of the Unionist party during this period. He began to stand to some extent outside party and above it, a moderator with a keenly analytic and rather sceptical mind, but still the recognized representative of the British empire in the councils of the world, and the trusted adviser of his sovereign. Though himself the last man to be selected as the type of a democratic politician—for his references to extensions of popular government, even when made by his own party, were full of mild contempt—Lord Salisbury gradually acquired a higher place in public opinion than that occupied by any contemporary statesman. His speeches—which, though carelessly composed, continued to blaze on occasion with their old fire and their somewhat mordant cynicism—were weightier in tone, and became European events. Without the genius of Disraeli or the personal magnetism of Gladstone, he yet inspired the British public with a quiet confidence that under him things would not go far wrong, and that he would not act rashly or unworthily of his country. Even political opponents came to look on his cautious and balanced conservatism, and his intellectual aloofness from interested motives or vulgar ambition, as standing between them and something more distasteful. Moreover, in the matter of foreign affairs his weight was supreme. He had lived to become, as was indeed generally recognized, the most experienced working diplomatist in Europe. Lord Salisbury's position in this respect was shown in nothing better than in his superiority to criticism. In foreign affairs many among his own party regarded him as too much inclined to "split the difference" and to make "graceful concessions"—as in the case of the cession of Heligoland to Germany—in which it was complained that Great Britain got the worst of the bargain. But though occasionally, as in the withdrawal of British ships from Port Arthur in 1898, such criticism became acute, the plain fact of the preservation of European peace, often in difficult circumstances, reconciled the public to Lord Salisbury's conduct of affairs. His patience frequently justified itself, notably in the case of British relations with the United States, which were for a moment threatened by President Cleveland's message concerning Venezuela in 1895. And though his loyalty to the European Concert in connexion with Turkey's dealings with Armenia and Crete in 1895–98 proved irritatingly ineffectual—the pace of the concert, as Lord Salisbury explained, being rather like that of a steam-roller—no alternative policy could be contemplated as feasible in any other statesman's hands. Lord Salisbury's personal view of the new situation created by the methods of the Sultan of Turkey was indicated not only by a solemn and unusual public warning addressed to the sultan in a speech at Brighton, but also by his famous remark that in the Crimean war Great Britain had "put her money on the wrong horse." Among his most important strokes of diplomacy was undoubtedly the Anglo-German agreement of 1890, delimiting the British and German spheres of influence in East and West Africa; but it is impossible in this place to give a final appreciation of the actual part played by Lord Salisbury in the various diplomatic questions of so busy a time.

1886-1902.

A peer premier must inevitably leave many of the real problems of democratic government to his colleagues in the House of Commons. In the Upper House Lord Salisbury was paramount. Even when the peers had rejected the second reading of the Government Vaccination Bill, as emasculated in the House of Commons by the introduction of the "conscientious objector," Lord Salisbury brought all his authority to bear and got the vote reversed at another sitting, in spite of the obvious sense of the majority both of that House and of the Conservative party outside Parliament. Yet while vigorously opposing the Radical agitation for the abolition of the House of Lords, he never interposed a *non possumus* to schemes of reform. He was always willing to consider plans for its improvement, and in May 1888 himself introduced a Bill for reforming it and creating life peers; but he warned reformers that the only result must be to make the House stronger. To abolish it, on the other hand, would be to take away a necessary safeguard for protecting "Philip drunk" by an appeal to "Philip sober."

Lord Salisbury suffered a severe loss by the death in 1900 of his wife, whose influence with her husband had

been great, as her devotion had been unswerving. Her protracted illness was one among several causes, including his own occasional ill-health, which after 1895 made him leave as much as possible of the work of political leadership to his principal colleagues—Mr Arthur Balfour more than once acting as foreign secretary for several weeks while his uncle stayed abroad. But for some years it was felt that his attempt to be both prime minister and foreign secretary was a mistake; and after the election of 1900 Lord Salisbury handed over the seals of the Foreign Office to Lord Lansdowne, remaining himself at the head of the Government as lord privy seal. In 1902, upon the conclusion of peace in South Africa, he felt that the time had come to retire from office altogether; and on 11th July his resignation was accepted by the king, and he was succeeded as prime minister by Mr Arthur Balfour.

Salmon.—Since the appearance of the article SALMONIDÆ in the ninth edition of the *Encyclopædia Britannica*, important advances have been made in our knowledge of the life-history of the salmon, and the extension of our information promises to have a considerable influence on the future management of salmon fisheries. These advances are chiefly due to the investigations of Professor Miescher on the Rhine at Basel, of Professor Hoek in Holland, of Mr Archer as lessee of the river Sands in Norway and as inspector of salmon fisheries for Scotland in conjunction with Messrs Gray and Tosh, and of a number of workers in the laboratory of the Royal College of Physicians of Edinburgh. With regard to the *food* of salmon, the enormously rapid growth of smolts to grilse and of salmon from year to year shows that they feed in the sea. In a few months a smolt will increase from a few ounces to 4 or 5 ℔; while Mr Archer's weighings of 16 salmon which had been marked and recaptured in the following year showed an average gain of 36 per cent., reckoned on from kelt stage to kelt stage. During the season of 1895 Mr Tosh, at Berwick-on-Tweed, opened between March and August 514 fish, and found food in the stomachs of 76, or over 14 per cent. of the whole. As to the nature of the food, it was found to be as follows:—

Herring in	36 or 47 per cent.
Crustacea, amphipods, &c. . .	14 ,, 18 ,,
Sand eels	11 ,, 14 ,,
Haddock and whiting . . .	8 ,, 10 ,,
Feathers and vegetable matter .	7 ,, 9 ,,

Excluding the feathers and vegetable matter, which are not really of the nature of food, all the material found in the stomach was of marine origin. Hoek, out of 2000 fish examined by him, found 7 with food in the stomach, and, curiously enough, 4 of these were taken on the same day. In each case marine fish constituted the food. As to where salmon go to feed in the sea, our information is still very deficient, but the prevalence of herring in the stomach would seem to indicate that they must follow the shoals of these fish which approach the coast during the summer months. While there can be no doubt that salmon feed in the sea, the question of whether they feed in fresh water has been much debated. It is difficult for the popular mind to conceive of an active fish like the salmon subsisting for several months without food, and the fact that the fish so frequently not only takes into its mouth but actually swallows worms and various lures has still further tended to confirm many people in the conviction that salmon do feed in fresh water. In discussing the question it is well clearly to understand what is meant by feeding. It is the taking, digesting, and absorbing of material of use in the economy in such quantities as to be of benefit to the individual. Accepting this definition, it may at once be said that all the evidence we possess is entirely opposed to the view that salmon feed when in fresh water. Miescher examined the stomachs of about 2000 salmon captured at Basel, about 500 miles from the mouth of the Rhine, and in only two did he find any indication of feeding. These two fish were male kelts. One contained the remains of a cyprinoid fish, and the other had a dilated stomach with an acid secretion but no food remains. Hoek, who, as already stated, examined about 2000 fish, found food of marine origin in 7, but in none food derived from fresh water. Of the 132 stomachs of salmon from the estuaries and upper waters of Scottish rivers examined in the laboratory of the College of Physicians not one contained any food remains. The stomach of salmon captured in fresh water is collapsed and shrunken. Its mucous membrane is thrown into folds, and it contains a small amount of mucus of a neutral reaction. The intestine, which usually contains numerous tape-worms, is full of a greenish-yellow viscous material which, when examined under the microscope, is found to consist of mucus with shed epithelial and other cells and with masses of crystals of carbonate of lime. In no case does the microscope reveal any food remains such as fish-scales, plates of crustacea, or bristles of worms or annelids. In the fish taken in the estuaries up to the month of August the gall-bladder is distended; in those taken later in the year it is empty. In all the fish from the upper waters the gall-bladder is empty and collapsed. According to the investigations of Hoek and of Gulland, the lining membrane of the stomach and intestine degenerates while the fish is in the river, but the correctness of these observations has been denied by Brown and Kingston-Barton. Gillespie finds that the activity of the digestive processes is low in fish taken from the rivers, and that micro-organisms, which would be killed by the hydrochloric acid of the gastric juice were it actively secreted, flourish in the intestines of the fish from the upper waters. Those who believe that the salmon feeds in fresh water explain the fact that the stomach is always found empty by the supposition that the fish vomits any food when it is captured, and several descriptions of cases in which this has been observed might be quoted; but such observations must be accepted with caution, and the contracted state of the stomach, the absence of the hydrochloric acid of the gastric juice, and lastly the absence of any traces of digested food remains in the contents of the intestine, negative this explanation.[1]

The question may be presented in another way. Is there any reason why the salmon should feed while in fresh water? An animal feeds to get energy for the work it has to do, and to get material to make good the waste from its body and to build up its various tissues. The investigations carried on in the laboratory of the College of Physicians have definitely shown that the salmon leaves the sea with an enormous supply of nourishment stored in its muscles, and that during its sojourn in fresh water it gets its energy and builds up its rapidly growing ovaries and testes from this stored material. The method of investigation was to take specimens, some from the estuary and some from the upper reaches, from the stream of salmon constantly passing from the sea up the rivers. These were carefully examined, measured, weighed, and analysed, and from the difference of composition the

[1] The following extract from the report of the Brighton Aquarium further supports the view that salmon abstain from food for a prolonged period.—"The Usk salmon . . . was placed there [in the Aquarium] as a smolt on April 5, 1878, and in the following month was transferred to salt water, in which it remained for upwards of five years, feeding freely on shrimps, &c., during a portion of the year, but abstaining from food between August and February; this, it may be remarked, is the time when it would naturally have been in the river."

changes they had undergone during their sojourn in the fresh water were determined. Briefly stated, these investigations show that the supply of albuminous material and fats stored in the muscles and used while the fish is in the river is amply sufficient, first, to afford the material for the construction of the ovaries and testes, and, second, to yield an amount of energy so enormous that even the most sceptical must admit that it is amply sufficient for the greatest requirements of the fish. The amount of energy liberated from the fats and albuminous material is 570 times more than is required to raise the fish from the level of the estuary to that of the upper waters! These analyses further show that all the materials required for the construction of the ovaries and the testes are to be found in sufficient quantity in the muscles, with the exception of iron, which is, however, abundantly present in the blood.

It is a very common opinion that kelts feed voraciously while still in fresh water, and this has been used as an argument that they should be destroyed. It is not easy to bring forward such satisfactory evidence as has been adduced in the case of unspawned salmon, since it is illegal to kill kelts; but none of the 25 kelts procured by the Scottish Fishery Board, and examined in the College of Physicians' laboratory, contained any food, and Mr Anderson, formerly of Dunkeld, informs the writer that in the old days, when kelts were habitually killed when captured, he has opened a large number and never found any trace of food in the stomach. On the other hand, some fishers declare that they have seen kelts devouring salmon fry, but it is not easy to make accurate observations in deep water. According to Dr Gulland's investigations, the mucous membrane of the stomach and intestine is completely regenerated while the gall-bladder contains bile, and the digestive activity of the alimentary canal is greater than in salmon before spawning. Kelts thus appear at least to be capable of feeding.

The rate of growth of the genitalia has been carefully studied by Miescher, Archer, and Hoek. From January till about the end of May the growth of the ovaries is slow. In Hoek's series of observations, which are the most complete, they increased from ·35 to ·85 per cent. of the body weight. After this they enlarge more rapidly, and by the end of August are about 3 per cent. in salmon taken at the mouth of the Tweed, about 4 per cent. in the salmon from the mouth of the Rhine, and about 8 per cent. in the salmon from the Basel fisheries. By November they have risen to 20 per cent. in the Tweed and in Holland, and to 23 per cent. in the upper reaches of the Rhine. According to Mr Archer's observations, the development of the ovaries in grilse in the earlier months somewhat lags behind that in the salmon. The growth of the testes has been chiefly investigated by Archer and Tosh in the Tweed and by Miescher at Basel. From March to the middle of July in the Tweed these organs increase from about ·19 to ·35 per cent. of the weight of the fish. In July their rate of growth increases, and they reach their maximum development at the end of September, when they are about 6 per cent. of the body weight. In the Rhine in March they weigh about ·1 per cent., and they reach their maximum development of about 5 per cent. in October.

What leads to the migration of salmon from sea to river and river to sea? It is usually supposed that they come to the river to spawn; that it is the *nisus generativus* that drives them from the sea, where their ova will not develop, to the fresh water where development is possible. But it is found that salmon are passing from sea to river at all seasons of the year, and with their genitalia in all stages of development—some fish running in March with ovaries only 1 per cent. of the body weight, other fish not running till October with ovaries 15 or 16 per cent. of the body weight. It is difficult, then, to accept the theory that the sexual act is the governing factor. That it is a secondary factor seems to be indicated by the great run of fish in June, July, and August, when the genitalia are most rapidly growing. There is one respect, however, in which all the fish leaving the sea for the river agree, and that is in the amount of stored material accumulated in their bodies. In the early running fish this material is largely confined to the muscles, but in the later coming fish it is more equally distributed between muscles and genitalia. The amount of stored material may be measured by the amount of solids, and if we express the results of all the fish examined in terms of fish of uniform size—100 cm. in length—the following results are obtained:—

	Nov.*	Feb.	Mar.	Apr.	May and June.	July and Aug.	Oct. and Nov.	Kelts.
Muscles .	2481	2214	2355	2599	2210	2270	1750	946
Ovaries .	23	24	24	33	47	72	545	9

* Winter fish not due to spawn till following November.

It would thus appear that, when the salmon has in the sea accumulated a certain definite amount of nourishment, it ceases to feed, and returns to the river irrespective of the state of its genital organs. Nutrition, and not the *nisus generativus*, appears to be the motive power. That the fish after spawning returns to the sea in search of food is fully recognized by all.

Course of Migration.—It is well known that while salmon run all the year through in greater or lesser numbers, the run of grilse takes place in the summer months, from May to August. But it is further possible to divide the salmon into classes—the so-called winter salmon of the Rhine, large fish running from October to February, with unripe ovaries and testes; and the summer salmon, running for the most part from March to October, with genitalia more or less ripe. These summer fish are small in the early months, but increase in size as the autumn advances. The winter salmon, along with the early summer or spring fish, appear to pass directly to the upper reaches of the river, and to spawn there, while the larger late-coming fish appear to populate the lower waters. This seems to be indicated by the comparison of upper-water and estuary fish throughout the year. The period at which male and female fish enter the rivers also appears to be somewhat different. The following table gives the percentages of males to the total number of salmon captured during the different months of the year, according to the observations of Tosh, Miescher, and Hoek:—

Percentage of Male Fish.

	Tosh. Mouth of Tweed.	Hoek. Mouth of Rhine.	Miescher. Upper Reaches of Rhine.	
			1878.	1879.
January . .	...	34·3	...	...
February . .	26·7	29·7	...	...
March . . .	28·8	29·4	...	...
April . . .	20·5	34·7	...	...
May . . .	22·3	28·7	...	...
June . . .	22·5	32·9	...	...
July . . .	27·3	37·6	29·7	19·4
August . .	26·1	32·7	24	26·8
September . .	29·6	...	44·5	38·4
October . .	...	44	42·4	52·4
November . .	...	39·6	28·8	46·2
December . .	...	31·7	...	...
Total .	24·6	33·2	34·4	40·5

These figures show that throughout the year the female fish exceed the males in number, and, secondly, that during the earlier months of the year female fish run in much larger numbers than do male fish. In fact, it is only in September that anything like an equality between the two sexes is established. But in Great Britain it is not until the end of August that the nets are removed, and one cannot but believe that the destruction of such a very large proportion of females as are captured during the early months of the season must have a most prejudicial effect upon the breeding stock.

Rate of Migration.—By a comparison of the first appearance of winter salmon and of grilse in the markets of Holland and of Basel—500 miles up the river—Miescher gives some data for the determination of the average rate at which salmon ascend an unobstructed stream. It was found that winter salmon appeared at Basel about 54 days after their appearance in Holland, which would give a rate of passage of about 10 miles per diem. From a smaller number of observations on grilse, it appears that they travel at a somewhat slower rate. It is, however, doubtful how far these figures are of value in deciding the rate at which fish pass up the lower reaches of the river.

The Food Value of Salmon from the Estuaries and the Upper Waters at different Seasons.—Dr Dunlop, using the extensive series of analyses made in the laboratory of the Royal College of Physicians of Edinburgh, concludes that "the food value of salmon flesh is greater when the fish is fresh run than when it has been some time in fresh water; that it diminishes as the season advances both in the estuaries and in the upper-water fish; and that the flesh of salmon caught in the upper reaches in October and November has only about one-half the value of the flesh of early estuary fish." The total food value of a salmon depends upon the quantity and quality of the flesh. The amount of flesh depends upon its length and its muscular development. (1) The total food value of estuary fish remains nearly constant throughout the year, the poorer quality of flesh in the later months being compensated for by the larger average size of the fish. (2) From May to August the total food value of fish caught in the upper waters is about one-third less than that of estuary fish. (3) The food value of upper-water fish in October and November is only about one-half that of the upper-water fish earlier in the year, and about one-third that of the estuary fish.

Presented to Parliament, and published 1898. (D. N. P.)

Salon, a town and railway station, arrondissement of Aix, department of Bouches du Rhône, 30 miles north-west of Marseilles, on the Canal de Craponne. Manufactures of so-called olive oil (but to the preparation of which various oil-seeds largely contribute) and soap are extensively carried on in numerous establishments—about 400 of the former and 20 of the latter. The town is of considerable antiquarian interest. Population (1881), 4983; (1901), 12,872.

Salonica, a vilayet (province) of Turkey, with an area of about 19,375 square miles and an estimated population of 1,050,000 inhabitants. The population of the town numbers 95,000, of whom 32,000 are Turks; 47,000, Jews; and 16,000 Greeks and Europeans. It is divided into 74 "quarters"—45 Turkish, 16 Jewish, 12 Greek, and 1 European. It contains 56 mosques, 23 tekkés, 16 churches, and 25 synagogues. Salonica is the centre of the import trade of the whole of Macedonia and part of Albania, being at the same time the principal port for shipment for the numerous products of that fertile region. The new harbour, which was opened to navigation in December 1901, allows the direct transhipment of all merchandise, whatever may be the direction of the wind, which was previously apt to render shipping operations difficult. The harbour works consist of a breakwater 560 metres long, with 28 feet depth of water on its landward side for a width of 150 metres. Opposite the breakwater is a quay 450 metres long and 85 metres in breadth, at each end of which a pier 200 metres long projects into the sea. Between the extremities of these two piers and those of the breakwater are the two entrances to the harbour. Salonica exports grain, silk cocoons, manganese, hides and skins, cattle, wool, opium, tobacco, oil-seeds, and fennel. In 1900 the exports were valued at £1,220,575—this is exclusive of the coasting trade; and the imports at £2,553,450. The latter consist principally of textiles, iron goods, sugar, tobacco, flour, coffee, and chemicals. The volume of the export trade has appreciably decreased. The main reason for this diminution is to be found in the rude methods of cultivation, which disable farmers from competing, either in quality or price, with the produce of countries wherein agricultural practice is more advanced. The industrial enterprises consist of several steam flour-mills, two cotton-spinning mills, two steam brick and tile factories, a brewery, a soap factory, and a small tannery. The making of morocco leather and other leather-work, such as saddlery, harness, and foot-gear of all sorts, affords employment to a large number of persons. Cutlery of the coarser sort, side-arms, field implements, and other ironmongery are made in considerable quantities. The spirit called mastic or raki is largely produced. Road-making in the vilayet of Salonica is not carried out on any settled plan or fixed principle, and the maintenance and repair of existing roads is equally a matter of chance. These latter, however, are few in number. Three railways traverse the vilayet—(1) a branch of the Oriental Railway, going due north from Salonica to Uskub and Nish; (2) the Junction Railway, between Salonica and Dedéagatch; (3) the Salonica–Monastir line. Salonica is well provided with schools—Turkish, Greek, Jewish, Italian, French, Servian, and Bulgarian.

Salop. See SHROPSHIRE.

Salta, a province in the north-west of the Argentine republic, bounded on the N. by the province of Jujuy and Bolivia, on the E. by the territories of Formosa and of the Chaco, on the S. by the provinces of Santiago, Tucumán, and Catamarca, and on the W. by Chile. Official area at the census of 1895, 62,184 square miles. Population in 1869, 88,933; in 1895, 118,015. The capital, Salta, on the Rio Salta, had a population of 16,672 in 1895, and is distant by rail 1571 kilometres from Buenos Aires. The province is divided into 21 departments. In 1895 there were 7398 farms and 134,993 acres planted in cereals.

Saltash, a municipal borough, Cornwall, England, in the Bodmin parliamentary division of the county, on the river Tamar, 5 miles north-west of Plymouth by rail. It was first incorporated in the reign of King John, and its charter has been confirmed in several reigns, finally in 1883. Until disfranchised in 1832 the borough returned two members to Parliament. It is governed by a mayor, 4 aldermen, and 12 councillors. The Royal Albert bridge, which carries the railway across the river, was built in 1857–59 at a cost of £230,000. A cottage hospital was erected in 1887, and the Wesley centenary chapel in 1891.

In Victoria Park is a monument to General Sir W. Penn-Symons, killed in the South African war, 1899. A steam ferry, free to inhabitants of the town, belongs to the corporation. There is also an efficient service of river passenger steamers. Population (1881), 2563; (1901), 3357.

Saltcoats, a police burgh (1885), seaport, and watering-place of Ayrshire, Scotland, 19 miles north of the county town by rail. Modern erections are a town-hall and a bathing station; there is also a mission coast home. Some fishing is done. A large number of the inhabitants find employment at Ardrossan and Stevenston. Two public schools had an average attendance of 1064 in 1898–99, and a Roman Catholic school 277. Valuation in 1885–86, £14,687; 1899–1900, £33,240. Population (1881), 5096; (1901), 8121.

Saltillo.—See Coahuila.

Salt Lake, the largest city and capital of Utah, U.S.A., and capital of Salt Lake county. It it situated in 40° 46′ N., longitude 111° 54′ W., at the west base of the Wasatch range, near the river Jordan and the west shore of Great Salt Lake. It is in the northern part of the state, and has an altitude in the lower part of the city of 4240 feet. It is the headquarters of the Mormon Church, or the Church of Jesus Christ of Latter Day Saints. The site of the city is a plain, sloping gently towards the north-west. On this it is laid out with the greatest regularity, in blocks 660 feet square, separated by well-shaded streets 132 feet wide. Temple Square, enclosing most of the buildings of the Mormon Church, is the centre of the city, and the streets surrounding it are known respectively as North, East, South, and West Temple Streets. The streets north of North Temple are known as 1st North, 2nd North, &c., and those west, east, and south similarly. The city is divided into five wards. It has an excellent water-supply from small streams flowing out of the Wasatch range, and is well sewered. A few of the streets in the business part are paved with asphalt, but most of them are merely gravelled. The Mormon Temple, which was completed in 1893, forty years after the laying of its corner-stone, is an exceedingly ornate building of grey granite, and is said to have cost $4,000,000. Other buildings in the Temple block are the Tabernacle, assembly hall, endowment house, offices and former residences of Brigham Young, &c. Salt Lake is entered by the Rio Grande Western, the Oregon Short Line, and the Salt Lake and Ogden railways, besides lines running to the resorts on the shore of Great Salt Lake, known as Saltair and Garfield Beach. The manufactures are not of great importance. In 1890 there were 175 manufacturing establishments, with a total capital of $3,354,035. They employed 2287 hands, and the product was valued at $4,624,419. It is the seat of the University of Utah, a non-sectarian institution, opened in 1850. In 1899 it had a faculty numbering 22, and was attended by 641 students, more than half of whom were women. The assessed valuation of real and personal property was, in 1900, $31,950,210, the net debt of the city was $3,383,135, and the rate of taxation was $28.10 per $1000. Population (1890), 44,843; (1900), 53,531, of whom 2741 were foreign-born and 514 coloured, including 278 negroes. Of 13,639 males 21 years of age and over, 203 were illiterate (could not write).

Salto, a city of Uruguay and capital of the department of the same name, situated on the banks of the Rio Uruguay, and an important port for foreign trade, as vessels of heavy draught cannot ascend the river beyond this point. A large amount of merchandise for and from Brazil passes overland through this port. The city was founded in 1817, and has a population of about 16,000. It is well built, has fine public buildings, and well-paved streets lighted by electricity. In 1898 the imports were valued at $634,838, and exports $1,679,095; and in 1900 the imports were $748,375, and the exports $2,067,513.

Saltykoff (Stchedrin), Michael Evgrafovitch (1826–1889), a celebrated Russian satirist, born on his father's estate in the province of Tula, 15th (27th) January 1826. His early education was completely neglected, and his youth, owing to the severity and the domestic quarrels of his parents, was full of the most melancholy experiences. Deprived of all rational instruction and left entirely to himself, he soon developed a love for reading; but the only book in his father's house was the Bible, which he studied with such deep attention that it appears to have exercised a decided influence in the formation of his thought and morals. At ten years of age he entered the Moscow Institute for the sons of the nobility, and subsequently the Lyceum at St Petersburg, where Prince Lobánof Rostofski, afterwards minister for foreign affairs, was one of his schoolfellows. While in this establishment he published several pieces of poetry, and translations of some of the works of Byron and Heine; and on leaving the Lyceum he obtained employment as a clerk in the Ministry of War. In 1884 he published *Zaputennoye Dyelo* ("A Complicated Affair"), which, in view of the revolutionary movements at that time in France and Germany, was the cause of his banishment to Vyatka, where he spent eight years as a minor Government official. This experience enabled him to study the life and habits of civil servants in the interior, and to give a clever picture of Russian provincial officials in his *Gubernskie Otcherki* ("Provincial Sketches"). On his return to St Petersburg he was quickly promoted to administrative posts of considerable importance. After making a report on the condition of the Russian police, he was appointed deputy governor, first of Ryazan and then of Tver. His predilection for literary work induced him to leave the Government service, but pecuniary difficulties soon compelled him to re-enter it, and in 1864 he was appointed president of the local boards of taxation successively at Penza, Tula, and Ryazan. In 1868 he finally quitted the civil service in order to devote the rest of his life to literature. During this period he wrote his principal works, namely, *Poshekhonskaya Starina* ("The Old Times of Poshekhona"), which possesses a certain autobiographical interest; *Istoria odnavo Goroda* ("The History of a Town"); A Satirical History of Russia; *Messieurs et Mesdames Pompadours*; and *Messieurs Golovloff*. At one time, after the death of the poet Nekrasoff, he acted as editor of a leading Russian magazine, the *Contemporary*. He died in St Petersburg, 30th April (12th May) 1889. (G. D.)

Salvador (Republic of), a country of Central America extending from 13° 12′ to 14° 28′ N. and from 87° 37′ to 90° 6′ W. It lies on the Pacific coast, and is bounded inland by the frontiers of Guatemala and Honduras. The lowlands are generally hot and, on the coast, malarial; but on the tablelands and mountain slopes of the interior the climate is temperate and healthy. There are only two seasons: the wet, which Salvadorians call winter, from May to October; and the dry, or summer, season, from November to April. In July and August there are high winds, followed by torrents of rain and thunderstorms; in September and October the rain is not heavy, but is continuous.

The territory comprised within the limits of the republic has an area variously estimated at 7230 square miles and at 8130 square miles. It is divided for political and

administrative purposes into 14 departments, which are subdivided into 31 districts. The population in 1887 was stated to be 664,513; (1892), 703,500; (1894), 803,534; (1st January 1901), 1,006,848, of whom 493,893 were males and 512,955 females. The number of Ladinos (whites and persons of mixed blood) was returned at 772,200, and of Indians at 234,648. The various elements were, before 1901, estimated as follows, and the proportion still holds good in the main: whites (creoles and foreigners) 10 per cent., mestizos 50 per cent., Indians 40 per cent., and a very small proportion of negroes. The whites of pure blood are very few, a liberal estimate putting the proportion at 2·5 per cent. There is no immigration into the country, and the rapid increase with which the population is credited can be due only to a large surplus of births over deaths. The chief towns, with their populations, are given as follows:—San Salvador the capital (59,544), Santa Ana (48,120), San Miguel (24,768), Ahuachapán (14,136), San Vicente (17,832), Sonsonate (17,016), Sensuntepeque (12,456), Nueva San Salvador (18,768), Zacatecoluca (15,120).

The constitution of 1864, modified in 1880, 1883, and 1886, vests the legislative power in a chamber of 42 deputies (3 for each department), chosen by the direct vote of the people. The president and vice-president of the republic are likewise chosen by direct popular vote, and they hold office for 4 years. The president is not eligible for the presidency or vice-presidency during the following presidential term. He is assisted by 4 ministers, the heads of departments of administration. Local government is carried on in each of the 14 departments by governors appointed by the central executive. The municipalities are administered by officers (alcaldes, regidores, &c.) elected by the inhabitants.

The Roman Catholic religion prevails throughout the republic, but there is complete religious freedom, so far as is compatible with public order. Civil marriage is legal, monastic institutions are prohibited, and education is in the hands of laymen. Primary education is gratuitous and obligatory. Statistics of school work are published irregularly, but in 1893 there were within the republic 585 primary schools, with an average attendance of 29,427. For secondary instruction there were 18 higher schools, including 3 institutes, a polytechnic school, and 2 normal schools, one for men and the other for women, these six institutions being supported by the Government. At San Salvador there is a national college for the higher education of women. Private secondary schools are carried on in various parts of the country. Superior and professional instruction is provided at the national university in the capital, where there are faculties of law and of various branches of science. In 1893 the secondary schools had about 1200 pupils, and the university had 180 students.

Justice is administered by a supreme court, and in district, circuit, and local courts. The active army consists of about 3000 men, and the militia, of about 18,000.

Finance.

The revenue of Salvador is mainly derived from import and export duties, but considerable sums are also obtained from excise duties, and smaller amounts from stamps and other sources. The principal branches of expenditure are the public debt, defence, and internal administration. The official figures showing the revenue and expenditure for three years and the estimates for two years are as follows (pesos being converted into sterling at the rate of 10 to £1):—

Years.	Revenue.	Expenditure.
	£	£
1897	766,940	863,600
1898	460,960	526,660
1899	447,890	517,620
1900	499,250	520,170
1901	561,980	575,210

The foreign debt, amounting to £726,420 (£240,000 of a 6 per cent. loan of 1889, and £485,720 of another of 1892) was in 1899 converted into 5 per cent. mortgage debentures of the Salvador Railway Company Limited, to which the Government has guaranteed, for 18 years from 1st January 1899, a fixed annual subsidy of £24,000. The internal debt, on the whole of which interest is paid at the rate of 4 per cent. per annum, amounted at the end of 1900 to 9,225,864 pesos, or about £922,590.

Industry.

The only industry extensively carried on is agriculture, but the methods employed are still primitive. The more important products are coffee, of which 38,626,480 ℔ were produced in 1898; 55,600,000 ℔ in 1901; sugar, 1965 tons in 1898; indigo, 1,041,798 ℔ in 1897; balsam, 105,579 ℔ in 1897. Rubber is collected; tobacco is grown in small quantities; cocoa, rice, cereals, and fruits are cultivated. The Government seeks to encourage cotton-growing, and in August 1900 published a decree offering to supply cotton seeds, to give instruction in the cultivation of the plant, and to bestow a bounty of one silver peso on each centner (about 220 ℔) of cotton exported. The Government has, moreover, established in the suburbs of the city of San Salvador, an agricultural educational establishment and model farm, which is to be stocked with selected breeds of cattle, horses, hogs, and fowls from the United States.

Minerals.

In the cordillera which runs through Salvador there are veins of various metallic minerals—gold, silver, copper, and lead being found mostly in the eastern, and iron in the western, part of the country. Coal has been discovered at various points in the valley of the Lempa. In the republic there are about 180 mining establishments, about half of them being in the department of Morazau, but there are no recent statistics of their operations.

Commerce.

The trade of Salvador is almost entirely confined to the import of cotton goods, woollen goods, sacks, and machinery, and to the export of coffee and a few other agricultural products. In the year 1900 the formation of a statistical office was decreed. The total imports for 1896 were estimated at the value of 3,347,718 pesos, or, approximately, £334,770, and the exports at 7,485,384 pesos, or £748,540. In 1900 the imports amounted to the value of 6,570,000 (£657,000); and the exports to 9,132,958 pesos (£913,290), including coffee, 7,568,339 pesos; indigo, 638,700 pesos; and balsam, 295,439 pesos. In 1900, according to British statistics, the imports from Salvador into the United Kingdom amounted to the value of £137,364, comprising £103,220 for 32,016 cwt. of coffee, and £23,166 for 1659 cwt. of indigo; the exports from the United Kingdom to Salvador amounted to £244,325, comprising £195,301 for cotton goods and yarns, £16,513 for sacks, and £12,138 for iron-work and machinery. The United States in the year 1899–1900 imported from Salvador 6,616,775 ℔ of coffee, valued at £118,740, and 54,971 ℔ of rubber, valued at £3940. The imports are (in order of value) from Great Britain, the United States, France, and Germany; the exports (chiefly coffee) are mostly to the United States and France.

Shipping and communications.

In 1896, 338 vessels entered and cleared at the ports of Salvador. The railway system which formerly connected the port of Acajutla with Sonsonate, Santa Ana, and Ateos, and San Salvador with Santa Tecla, has been improved by the construction of a line from Santa Ana to San Salvador, putting the capital in direct communication with the coast. The old port of Acajutla has been closed, and a new port opened in a more sheltered position about a mile to the north, where an iron pier, warehouses, and custom house have been erected. A railway between San Miguel and La Union (22 miles) is intermittently under construction. The postal system has some 260 post offices, through which pass annually about 232,000 letters and packets in the inland service, and 563,000 in the foreign. In 1896 there were 1730 miles of telegraph wire, and 121 telegraph offices, through which in the year there passed 60,682 messages.

Currency and credit.

At the end of 1899 there were three commercial banks and an agricultural bank within the republic. One of these, an English bank, had a capital of £275,700 and a reserve fund of £10,000; the three other banks had an aggregate capital stated at 8,250,000 pesos, and reserve funds amounting to 1,035,000 pesos. In 1897 a law was passed adopting the gold standard. The currency of the country in 1900 consisted entirely of silver pesos, the fractional money under ·900 fine having, by arrangement with the Government, been all exported by the banks. The peso or dollar at par is valued at 4 shillings; its actual value is under 2 shillings. In foreign exchange at the end of 1899 the premium of gold was 96 per cent., in July 1900 it was 130 per cent.

The metric system of weights and measures was adopted by decree of January 1886, but the old Spanish weights and measures still continue in general use.

(W. W. R.; I. P. A. R.)

Salvage.—There is no general rule or principle of law which entitles one who saves the life or property of another to be rewarded by him. But in certain special classes of cases the law does require the appointed courts to reward those who by their exertions have rescued lives or property from probable damage or destruction. The reward so given is called salvage, and the same word is often used to denote the service rewarded. The subject divides into (1) civil salvage, (2) military salvage.

(1) *Civil Salvage* is defined as such a service as may become the ground of a reward in the (Admiralty) Court on the civil side of its jurisdiction, and consists in the preservation of life or property from some of the manifold dangers which are at all times incident to the navigation of the sea. The jurisdiction to give it is an Admiralty jurisdiction. But the right to reward was recognized in the courts of common law before the Admiralty Court became, as it now is, a part of the High Court of Justice, *e.g.*, by enforcing a possessory lien of the salvor over the salved property. The origin of the rule has been traced to the doctrine of Roman law that "spontaneous services" in the protection of lives and property should be rewarded. But that doctrine has not found a place in English law, except as part of the maritime law administered in the Court of Admiralty. Thus services on land, say in rescuing lives or houses or goods from fire, do not entitle the person rendering those services to reward, unless he has acted under some contract or employment. But at sea the right to reward springs from the service itself, if it has been rendered to a ship, or her passengers, crew, or cargo, or to property which has been thrown or washed out of her. And such a service entitles to salvage though the ship may be in harbour, or within a river, or even in a dock. This connexion of the lives or property with a ship seems essential. The right does not arise upon saving goods which have got adrift in river or harbour, even if they have been washed out to sea, nor upon saving property of other kinds which may be in peril on the sea, or on the seashore. Thus a claim to reward for saving a gas-buoy, or beacon, which had broken from its moorings in the Upper Humber, and was aground on the Lincolnshire coast, was disallowed by the House of Lords, affirming the Court of Appeal, in the case of the Gas-float Whitton No. 2, 1897, A.C. 337. The buoy was not a ship; and the Admiralty jurisdiction hitherto confined to salvage of ships, apparel, cargo, and freight could not be extended to the buoy merely because it was property connected with navigation.

The definite right to salvage for saving lives from ships is the creation of modern statutes (now the Merchant Shipping Act, 1894, § 544). Formerly the Admiralty judges treated the fact that lives had been saved as enhancing the merit of a salvage of property by the same salvors, where the two could be connected; and so indirectly gave life salvage. And this is still the position in cases where the Merchant Shipping Act does not apply. This Act (§ 544) applies to all cases in which the "services are rendered wholly or in part within British waters in saving life from any British or foreign vessel, or elsewhere in saving life from any British vessel." Also (§ 545) it can be applied, by Order in Council, to life salvage from ships of any foreign country whose Government "is willing that salvage should be awarded by British courts for services rendered in saving life from ships belonging to that country where the ship is beyond the limits of British jurisdiction." By section 544 the life salvage is made payable "by the owner of the vessel, cargo, or apparel saved"; and is to be paid in priority to all other claims for salvage. Where the value of the vessel, cargo, and apparel saved is insufficient to pay the life salvage, the Board of Trade may in their discretion make up the deficiency, in whole or in part, out of the Mercantile Marine Fund. The effect of the Act is to impose a common responsibility upon the owners of ship and cargo to the extent of their property saved. Whatever is saved becomes a fund out of which life salvors may be rewarded, and to which they are entitled in priority to other salvors. In the case of the cargo *ex Schiller* (1877, 2 P.D. 145) salvage was allowed out of specie raised by divers from the sunken wreck, to persons who had saved some of the passengers and crew.

This limitation of liability to the amount of the property salved is also true with regard to salvage of property. The ordinary remedy of the salvor is against the property itself; by proceedings *in rem*, to enforce the maritime lien given him by the law upon that property. This enables him to arrest the property, if within the jurisdiction, into whose hands soever it may have come; and, if necessary, to obtain a sale, and payment of his claim out of the proceeds. The salvor has also a remedy *in personam*, used only in exceptional cases, against the owners or others interested in the property saved (Five steel barges, 15 P.D. 142); but it seems certain that that depends upon property having been saved, and having come to the owner's hands; and that the amount which can be awarded is limited by the value of that property.

An essential condition is that the lives or property saved must have been in danger—either in immediate peril, or in a position of "difficulty and reasonable apprehension." Danger to the salvor is not essential, though it enhances his claim to reward; but to constitute a salvage service there must have been danger to the thing salved. Again, the service must have helped usefully towards saving the lives or property. Ineffectual efforts, however strenuous and meritorious, give rise to no claim. But the service need not be completely successful. If it has contributed to an ultimate rescue it will be rewarded, though that may have been accomplished by others. And as we have seen, there must have been ultimate success. Some of the property involved in the adventure must have been saved. And the value of that, or the fund realized by its sale, limits the total of the awards to all the salvors. Cases, of course, occur in which services at sea are employed by ships in danger; as where a steamer with a broken propeller shaft employs another steamer to tow her; or where a vessel which has lost her anchors employs another to procure anchors for her from shore. In such cases the conditions of reward above set out may not apply. Reward may be payable, notwithstanding entire failure of success, by the express or implied terms of the employment. But such a reward is not truly "salvage."

Services rendered in the performance of a duty owed do not entitle to salvage. The policy of the law is to stimulate voluntary effort, not to weaken obligation. Thus the crew cannot (while still the crew) be salvors of the ship or cargo; nor can the passengers, useless they have voluntarily stayed on the ship for the purpose of saving her. Nor can a pilot employed as such be salvor, unless he has boarded her in such exceptional circumstances that his doing so for pilotage fees could not reasonably be required; or unless the circumstances of the service,

entered upon as pilotage, have so changed as to alter its character; and it may be doubted whether such a change of circumstances is a valid ground for a claim of salvage remuneration by the pilot where he has had no opportunity of leaving the ship. So again of the owners and crew of a tug employed to tow a ship. They cannot claim salvage for rescuing her from a danger which may arise during the towage, unless circumstances have supervened which were not contemplated, and are such as to require extraordinary aid from the tug, or to expose her to extraordinary risk. Officers and crew of a ship of the royal navy may have salvage where they have rendered services outside the protection which their ship ought to afford. But by the Merchant Shipping Act, 1894, § 557, such a claim must be with consent of the Admiralty; and no claim can be made in respect of the ship herself.

The kinds and degrees of service are very various. The rewards given vary correspondingly. Regard is paid, first, to the degree of the danger to the property salved, to its value, and to the effect of the services rendered; next, to the risks run by the salvors, the length and severity of their efforts, the enterprise and skill displayed, and to the value and efficiency of the vessel or apparatus they have used, and the risks to which they have exposed her. In a modern case (the *Glengyle*, 1898, A.C. 519) a specially large award was given to vessels kept constantly ready for salving operations in Gibraltar Bay. It was owing to that readiness that the rescue had been possible. On the other hand, any negligent or improper conduct of the salvors will be considered in diminution of the award: as where they have negligently exposed the ship to damage, or have plundered the cargo, or dealt with it contrary to the owner's interests. And where the rescue has been from a danger which was brought about by the negligent or improper conduct of those who effected the rescue, no salvage is allowed. So that where two colliding ships were both to blame for the collision, the master and crew of one of them were not allowed salvage for services in saving cargo of the other (cargo *ex Capella*, L.R. 1 A. and E. 356).

In apportioning the total award given for a salvage service among the owners, master, and crew of the vessel by means of which it has been rendered, the special circumstances of each case have to be considered. In nearly all cases a large portion goes to the owners, and as in recent times the value and efficiency of ships (especially of steamships) have increased, so the proportion of the whole usually awarded to the owners has also increased. In an ordinary case of salvage by a steamship towing a distressed ship into safety, the share of the owners is usually about three-fourths; of the remainder the master usually gets about one-third; and the officers and crew divide the rest in proportion to their ratings. But where the salving ship has sustained special damage in the service, or her owners have been put to loss by it, that is taken into account. On the other hand, where special personal services have been rendered by members of the crew they are specially rewarded.

As an illustration take the case of the *Rasche* (L.R. 4 A. and E. 127). The brigantine *Rasche*, derelict, was fallen in with by the ship *Scythia* (carrying a very valuable cargo) 220 miles north of the Lizard. The mate and three hands of the *Scythia* were put on board, and in circumstances of much hardship and danger they brought her after eighteen days safely to Liverpool. After deducting expenses incurred by the owners of the *Scythia*, the value of the property saved was £6294. Sir R. Phillimore awarded £3290; and of this he gave £600 to the mate, £510 to each of the three men who had accompanied him; £500 to the owners of the *Scythia*; and £350 to her other officers and crew.

An agreement as to the salvage to be paid is sometimes made at the time the assistance is given. When made fairly the court will act upon it, though it may turn out to be a bad bargain for one or other of the parties. But if the facts were not correctly apprehended by one or both, or if the position was one of such difficulty that those salved had no real option as to accepting the salvor's terms, the courts will set the agreement aside.

This happened, for instance, where the salving ship refused to rescue 550 wrecked pilgrims from the Parkin Rock in the Red Sea for a less sum than £4000. An agreement had in consequence been signed for their conveyance for that sum to Jedda, two or three days' sail. The Parkin Rock stands six feet above the water, and had bad weather come on the lives would have been in great danger. It was held that the sum asked for was exorbitant; and that the agreement, made under practical compulsion, could not stand (the *Medina*, 2 P.D. 5). On the other hand, an agreement to tow, for a fixed sum, a vessel which had suffered considerable damage, was set aside, and salvage awarded, on the ground that the damaged condition had not been disclosed to the tug when the contract was made (the *Kingalock*, 1 Spink, 265).

The award of salvage is generally made in one sum against ship, freight, and cargo; and those interests contribute to the amount in proportion to the values saved. No distinction is made between the degree of service rendered to one interest and another. But, with a possible exception in the case of life salvage, there is not a joint liability of the several interests. Each is liable to the salvors for his own share, and for no more. The ship cannot be made to pay the cargo's share, nor the cargo the ship's. If, however, the shipowner pays the cargo's share, he has a lien upon it for the amount. In practice the liabilities for salvage are ordinarily adjusted as part of general average. Strictly, however, there is a difference. The liability to pay salvage is a direct liability to the salvors, arising at once, *e.g.*, at the port of refuge, and proportional to the values there; whereas the liability to contribute to a general average loss or expenditure is postponed until the completion or break up of the adventure, and depends upon the values of the interests which have arrived there; which may be very different. (See GENERAL AVERAGE.)

AUTHORITIES.—KENNEDY. *On the Law of Civil Salvage.* London, 1891.—ABBOTT. *Law of Merchant Ships and Seamen*, 13th edition. London, 1892.—CARVER. *Carriage by Sea*, 3rd edition. London, 1900. (T. G. C.)

(2) *Military Salvage* is analogous to civil salvage. It is defined as such a service as may become the ground for the demand of a reward in the court as a prize court, and consists in the rescue of property from the enemy in time of war. Such cases almost invariably relate to ships and their cargoes; and they have always been dealt with by courts having Admiralty jurisdiction, sitting as prize courts. They involve the determination of two questions: first, whether the property is to be restored to its original owner or condemned as prize to the recaptor; and second, what amount of salvage, if any, is to accompany restitution. Generally speaking, the first question depends upon the law of nations, which may be taken to be that where a ship has been carried by an enemy *infra præsidia*, and especially after a sentence of condemnation, the title of the original owner is divested, and does not revest upon recapture by third parties. In such a case, therefore, *jure gentium* restitution cannot be claimed. The municipal law of civilized countries, however, does not encourage subjects to "make reprisals upon one another," (the *Renard*, Marr. Adm. Dec. 222), and laws are generally found, as in England, which as between subjects of that particular state provide for restitution irrespective of any change in the title to the subject matter which may have occurred. But (speaking henceforth of England), in cases which do not fall strictly within these Acts, the old maritime law, which was in unison with the general law of nations, is applied by the courts. Moreover, the English Prize Acts do not

apply to foreign owners of recaptured prizes, and therefore no award can be made against them unless in accordance with the law of nations. In practice the courts have acted upon the "rule of reciprocity" where recaptures have been made of the property of formal allies, dealing with them as the allied state would have dealt with English property. In the case of neutral recaptures restitution is always ordered. An exception to the rule of restitution as between British subjects is made in the case of a British ship which has been "set forth as a ship of war" by the captor, and subsequently retaken by a British ship. Such a ship is not liable to restoration, but is the prize of the recaptor. This exception, the object of which is to encourage the capture of armed ships, dates from 1793, previous Acts having provided for restitution upon payment of a moiety as salvage. The condition of setting forth as a ship of war is satisfied, where under a fair semblance of authority, which is not disproved, the ship "has been used in the operations of war, and constituted a part of the naval force of the enemy" (the *Ceylon*, 1 Dod. 105). Such a user permanently obliterates the ship's original character, and extinguishes all future claims to restitution (*L'Actif*, Edw. 185).

As to the right to salvage and the amount which will be allowed, this is also a question of the *jus gentium*, though usually governed by municipal law. The right was recognized so long ago as the 11th century, when the "Consolato del Mare" laid down elaborate provisions on the subject. In England the first statutory recognition of the right occurs in 1648, when an Act of the Commonwealth, which in its outline has been the model for all subsequent Prize Acts, provides that British vessels captured by an enemy and retaken by British ships shall be restored upon payment of one-eighth of the value of the property in lieu of salvage, or one-half in the case of a prize "set forth as a ship of war." From that date until 1864, the date of the Act now in force, there have been thirteen Prize Acts dealing with recapture, each of which, except that of 1864, has been passed to meet a particular occasion, and has expired with the cessation of the then existing hostilities. Since the first Act, and down to the Act of 1805 inclusive, a distinction has always been drawn between a recapture effected by one of the royal ships of war and a recapture by a privateer or other vessel. In the former case the allowance has always been one-eighth, in the latter it varied, but was usually one-sixth. In the Act of 1692 a clause taken from a Dutch law gave salvage to a privateer, rising in amount from one-eighth to one-half according to the number of hours the prize had been in the enemy's possession, but this clause has disappeared since 1756. There is no provision in the present Act for the payment of salvage, except in case of recapture by one of His Majesty's ships, but it seems beyond question that recaptors are entitled at law to salvage, although they may hold no commission from the Crown. "It is the duty of every subject of the king to assist his fellow-subjects in war, and to retake their property in the possession of the enemy: no commission is necessary to give a person so employed a title to the reward which the policy of the law allots to that meritorious act of duty" (the *Helen*, 3 C. Rob. 226, *per* Sir W. Scott). Though it is improbable that privateers will figure in any future war, it may reasonably be anticipated that recaptures may be made by private vessels, and in such cases salvage would probably be awarded, the proportion lying in the discretion of the court. Similarly, salvage is awarded in the case of recapture from pirates or from a mutinous crew. In the case of royal ships the present Act allows one-eighth salvage, which in cases of "special difficulty or danger" the court may increase to a quarter. The latter provision is an innovation.

It may appear that the grant of salvage to ships of war, the duty of whose commanders it is, according to the naval instructions, "if possible, to rescue any British vessel which he may find attacked or captured by the enemy," needs some justification. Objections on this ground have never been seriously treated, it being urged that it is politic to encourage the undertaking of such enterprises, even where they coincide with the path of duty. Where, however, a transport was rescued from under the guns of an enemy by a ship of war, under whose charge she sailed, salvage was refused on the ground that the salvor was only doing what he was bound to do (the *Belle*, Edw. 66). So no salvage is due to a crew who rescue a ship from mutineers, this being only their duty under a subsisting contract (the *Governor Raffles*, 2 Dod. 14). On the other hand, a crew who rescue their ship from the prize crew of a belligerent are entitled to salvage, since the capture discharges them from their contract with the owner, and they act as volunteers (the *Two Friends*, 1 C. Rob. 271). In the case of a neutral captured by one belligerent and recaptured by the other, which has been already alluded to, no salvage is as a rule allowed, upon the supposition that if the vessel had been carried into the port of the enemy justice would have been done and the vessel restored. In the case of the French war at the opening of the 19th century no such supposition existed, and salvage was usually awarded on the recapture of neutral property from the French.

(M. Bt.)

Salvage Corps.—The London Salvage Corps is maintained by the fire offices of London. The corps was first formed in 1865 and commenced operations in March 1866. The staff of the corps when first formed consisted of 64. Since that time, owing to the many improvements that have taken place in the system of dealing with salvage, and the increase in the work to be done, the corps has necessarily been strengthened, and the staff now numbers 106. The various stations of the corps are well placed, and the Metropolis has been mapped out so that when a fire takes place the various districts may be attended to at the earliest possible moment, and the salvage operations commenced at once before any great damage has been done. The headquarters are situated at Watling Street, which is called the No. 1 station, and this station protects the large and valuable risks in the City of London enclosed by the Euston Road, Tottenham Court Road, City Road, and the river Thames; this is known as the "B" district. No. 2 station is situated at Commercial Road, and this station attends to the fires occurring within the whole of the eastern and north-eastern portion of London to the north of the Thames, and is known as the "C" district. No. 3 station, opposite the headquarters of the Metropolitan Fire Brigade Station in the Southwark Bridge Road, protects the whole of south London, and is known as the "D" district. No. 4 station, at Shaftesbury Avenue, is in constant attendance at fires in the west of London, called the "A" district, which extends to and embraces the vast district and the valuable risks of the West End and Kensington. Finally, No. 5 station, in Upper Street, Islington, acts as guardian to the large parish of Islington. The working staff of the corps, which is mainly recruited from the royal navy, consists of the chief officer, and a superintendent, foreman, and crew of men at each station, ready to turn out immediately on receipt of a "call." The stations of the corps are connected by telephone with the fire brigade stations from whence the "calls" are received. In addition to the home staff, there is also a staff constantly employed during the daytime in inspecting docks, wharves, Manchester goods and uptown warehouses, and reports are made weekly to the committee, when various defects that have been pointed

out by the inspectors are considered and definite action taken in order to prevent disaster from the continuance of the evils.

Generally speaking, the work of the London Salvage Corps may be divided into two distinct classes—(1) services at fires; (2) watching and working salvage.

(1) *Services at Fires* form the most important feature of the work. Much depends upon the method of dealing with the salvage. If, for instance, a large Manchester goods warehouse was on fire in the top part, it would be very little advantage to the offices interested in the risk if the men were set to work removing the stock off the ground floor. The best method would be to cover up with tarpaulin all goods there, and prevent the water from collecting on the lower floors. It will be gathered that the most important work of the corps is to prevent damage to goods, and that water is mostly looked after. Of course the damage likely to accrue from fire is not overlooked, though this is left almost entirely to the fire brigade. The traps, which immediately on receipt of an alarm proceed to the scene of the fire with their crew of men, carry every kind of appliance for the saving of goods from destruction by fire or damage by water, such as waterproof cloths, torches, axes, hand-pumps, buckets, shovels, sawdust, crowbars, ropes with large iron hooks attached (for pulling down dangerous walls or pulling out burning bales of goods), picks, &c., as well as lime-light apparatus for use in working after the fire has been extinguished, thus enabling the men to note the position of dangerous walls, &c.; and a portable coal-gas apparatus, which can be employed in the interior of buildings when the ordinary means of illumination has failed; in addition to ambulance appliances for emergencies. The following table contains statistics of the working of the London Salvage Corps for the years specified:—

Year.	Fires attended by Corps.		Services rendered.	
	Within Metropolitan Area.	Without Metropolitan Area.	Contents.	Buildings.
1892	2324	109	903	615
1893	2241	118	830	558
1894	1936	84	596	521
1895	2193	119	777	542
1896	2035	137	744	640
1897	1999	136	700	527
1898	2122	116	741	473
1899	2180	149	804	590
1900	2170	122	1056	794
1901	2488	167	1167	850

(2) *Working Salvage.*—When a fire takes place, a man is left behind in charge of the salvage if the property is insured; or if that fact cannot be ascertained, but it appears probable that it is, a man is left until the information is obtained later. The duty, if an important one, is divided into a day and night duty. This enables an experienced man to be sent on day duty to meet the surveyor, and to carry out his instructions regarding the working out of the salvage; and a junior man at night. The duties vary so considerably that it would be impossible to frame one set of rules to apply to all cases. Each man on picking up his duty is given certain orders by the superintendent, and fully informed as to the nature of the duty and any special points requiring attention. The day man, if working out salvage, would employ a number of men called strangers, over whom he acts as a kind of foreman. The "working out" may take the form of dividing up damaged goods into certain lots ready for a sale to be held by the surveyor, or it may be for the purpose of sifting over the débris to find remains of certain articles claimed for. If, for instance, a large fire occurred at a pianoforte manufacturer's, and the débris was all in one common heap, if considered advisable the men of the London Salvage Corps would have to arrange certain quantities of pegs and wires in order to give an idea as to the number of pianos before the fire. The watching continues until the loss is settled, when the charge of the premises is given over to the assured.

It would be absolutely impossible to estimate in any degree the large sums that are saved by this valuable body every year.

There are also salvage corps on similar lines, but on a smaller scale, in Liverpool and Glasgow. (C. J. F.)

Salvation Army, The.—A religious philanthropic organization founded by the Rev. William Booth, who in 1865 began to hold meetings for preaching in the streets of London, and in tents, music halls, theatres, and other hired buildings. Large numbers attended, many of whom had never before entered a place of worship, and presently an organized society was formed, called "The Christian Mission." Mr Booth was assisted by his wife, Catherine Booth, a woman of remarkable gifts, who won the sympathy for the new movement of many among the cultured classes. In 1878 the Mission, which had spread beyond London, was reorganized on a quasi-military basis. The local societies became "Corps," and their evangelists "Officers," with Mr Booth as "General" of the whole body. The operations of the Army at once rapidly expanded; and in spite of much disorderly opposition in particular places, its work has grown ever since, large numbers of outcasts having been reclaimed. In 1878 there were reported 80 corps and 127 officers in the United Kingdom. In doctrine, the Army is in harmony with the main principles of the evangelical bodies, "as embodied in the three creeds of the Church." Its preaching is practical and direct, asseverating the reality of Sin and Redemption. The Army proclaims the supreme duty of self-sacrifice for the sake of the salvation of others.

The Army is under the control of the General for the time being, who issues all orders and regulations; but large powers devolve upon other officers, such as the "Chief of the Staff," the "Foreign Secretary," and the "Chancellor," who direct affairs from the "International Headquarters" in London. The Army is divided, usually in harmony with national boundaries, into "Territories," each under a "Commissioner," with headquarters in the capital of the country. The Territories are again divided into "Provinces" or "Colonies," and these again into "Divisions," which include a number of Corps, each supporting its own "Captain" and "Lieutenant." The "soldiers" or members are drawn from all classes of the community. The property of the Army in the United Kingdom is held by the General for the time being, for the benefit of the Army exclusively, he being constituted a trustee of the property, in the disposal of which and in the appointment of his successor he is placed under the government of a deed poll, enrolled in the Court of Chancery in August 1878. In other countries various modifications have been necessary, but the General's ultimate control has been practically assured. Funds are raised from the voluntary offerings of the Corps, from friends interested in charitable work, and from the profits on publications. A strict system of accounts and audit is everywhere observed, the financial statements of the various national headquarters funds being annually published, certified by public accountants, in each country. The total receipts for 1899 from all sources at home and abroad was reported as £1,659,782.

Statistics reported October 1901.

Mr Booth's scheme for *Social Relief*, described in *In Darkest England, and the Way Out* (1890), attracted widespread interest, and was started with subscriptions amounting to £100,000. A separate trust was declared for the property and funds of this branch of work. Since then, both in Great Britain and abroad, the scheme has been actively carried out. The amount received in the year ending 30th September 1901 for cheap food and lodging in the United Kingdom was returned at £35,925. Help has been given to large numbers of unemployed, ex-criminal, and lost persons. In the year ending 30th September 1901, the number of persons received into factories was reported as 3515, of women and girls received into rescue homes as 2223. The farm colony at Hadleigh in Essex has a large acreage under cultivation, with fruit and market gardens and various industrial undertakings.

Summary of Social Operations throughout the World, October 1901.

Total number of officers engaged exclusively in social work, 2669.

In the Army there are a number of subsidiary branches of work, such as the Orphanages, the Naval and Military League for work among the troops in peace and war, and the Life Assurance Branch in England. Women take the same rank as men. All officers and many of the rank and file wear a special uniform. Music is universally employed.

(G. E. N.)

Salvini, Tommaso (1829-——), Italian actor, was born at Milan, 1st January 1829. An actor from the age of fourteen, he had the advantage at an early stage in his career of joining the company headed by the famous actress Ristori, with whom he was for long associated. He fought in the cause of Italian independence in 1849; otherwise his life was an unbroken series of successes in his art. He acted on various occasions in England and in America, as well as in most of the European capitals. His most famous impersonations included Othello, Conrad in *La Morte Civile*, Egisto in Alfieri's *Merope*, and Paolo in *Francesca da Rimini*. He took part in January 1902 in the celebration of Ristori's eightieth birthday.

Salween. This river, called Nam Kông by the Shans, Thanlwin by the Burmese, Lu Kiang, or Nu Kiang, or Lu Tzu Kiang by the Chinese, is the longest river in Burma, and one of the wildest and most picturesque streams in the world. Its sources are still undetermined, but there seems little doubt that it rises in the Tanla mountains, south of the Kuen Luen, somewhere in 32° or 33° N., and that perhaps it draws some of its water from the Kara Nor. It is thus a much longer river than the Irrawaddy. From the time it leaves Tibet it has a very narrow basin, and preserves the character of a gigantic ditch, or railway cutting, with for long stretches no other affluents than the mountain torrents from the hills, which rise from three to five or six thousand feet above the level of the river-bed. In the dry weather the banks are alternate stretches of blinding white, fine sand, and a chaos of huge boulders, masses, and slabs of rock, with here and there, usually where a tributary enters, long stretches of shingle. In the rains all these disappear, and the water laps against forest trees and the abrupt slope of the hills. The average difference between high and low water level of the Salween throughout the Shan States is between fifty and sixty feet, and in some places it is as much as ninety. There are many rapids, caused by reefs of rock running across the bed, or by a sudden fall of from one to several feet, which produce very rough water below the swift glide; but the most dangerous places for navigation are where a point juts out into the stream, and the current, thrown back, causes a violent double backwater. Nevertheless, long stretches of the river, extending to scores of miles, are habitually navigated by native boats. The current is extremely variable, from half a mile an hour to ten knots. For this reason the river is practically unnavigated. Launches ply regularly from Moulmein to the mouth of the Yônzalin, in Lower Burma. The worst part of the whole Salween, so far as is known, is the gorge between the mouth of the Yônzalin and Kyaukhnyat. It is quite certain that steam launches could ply over very long sections of the river above that, perhaps as far as the Kaw ferry, or even the Kun Lông ferry. In British territory, however, there are very few settlements on the river itself, and frequently the ferry villages are built a thousand feet above the river.

The Chinese believe the Salween valley to be deadly to all strangers, but it is in Chinese territory—particularly in the Lu Kiang, or Mŏng Hkö state—that there is the largest population on the river of any place until Lower Burma is reached. A description of the Salween resolves itself into a list of the ferries at which it can be crossed, for no one marches up the river. The river is bridged by the Chinese on the main route from Têng Yüeh (Momien) and Bhamo to Tali-fu. There are two spans; these are not in a straight line, but parallel to one another at the distance of the breadth of the central pillar. Each span is formed by twelve or fourteen massive iron chains, with planks laid across them. There was a bridge some 20 miles lower down, but this was destroyed in 1894. In British territory there are no bridges, and the ferries are the same as those maintained before the annexation. There are a great number of these ferries, but only a few are used, except by the local people. From Ta Hsang Lô large trading boats ply regularly to Kyaukhnyat, whence the traders make

their way by land over the hill to Papun, and so down the Yônzalin.

The chief tributaries of the Salween in British territory are the Nam Yu and the Nam Oi or Nam Mwe on the right bank, and the Hsipa Haw on the left. These are short but fair-sized streams. Near the Kun Lông ferry the Nam Nim, on the right bank, and the Nam Ting, on the left, are considerably longer, and the Nam Ting is navigable by native craft for considerable stretches up to Mêng Ting, and farther. To the south the next tributary is the Nam Kyek, on the right bank, down the valley of which the railway will reach the Salween. Below this are two streams called Nam Ma, one entering on the right bank, the other on the left, at no great distance from one another, but of no great length. A little below is the Nam Nang, on the left bank, coming from the Wa country. The Nam Kao enters in a cascade of nearly 200 feet in the cold weather from the right, and then there are no affluents till the Nam Hka comes in on the left. This has a great volume of water, but is unnavigable because of its steep gradient and many gorges. After the Hwe Lông, entering from the left at Ta Kaw, is passed, the Nam Pang comes in 22 miles lower down on the right bank. This is probably the largest tributary of the Salween; some distance above its mouth, at Kēng Hkam, it is 400 yards wide and quite unfordable. The next important tributary is the Nam Hsim, on the left bank, rising in the latitude of Kēng Tūng. It is a large but quite unnavigable stream. Except the Mē Sili and Mē Sala, from opposite sides, and the Nam Hang, which burrows its way through a range of hills from the east, and the Nam Pan, coming from the west, there is no considerable tributary till 19° 52′ N., where the Nam Tēng comes in on the right from the central Shan States. This is a considerable river, and navigable for long stretches in its upper course, but the last few miles before it enters the Salween are little better than a cataract. Below this the only large affluent is the Nam Pawn, which drains all Karenni and a considerable portion of the Shan States, but is quite unnavigable. Below this the tributaries are again only mountain streams till the Thaung-yin comes in from the south-east. Thirty miles lower down is Kyodan, the great timber depôt. Here a cable, stretched across the river, catches all the timber, which is then made up into rafts and floated down to Kado, near Moulmein, where the revenue is collected. The Yônzalin enters the Salween from the right about 10 miles below Kyodan. Boats can ply from Kyodan southwards, and light draught steamers ascend as far as Shwegôn, 63 miles from Moulmein. The Salween cuts the British Shan States nearly in half, and is a very formidable natural obstacle. It seems probable, however, that long stretches of it can be opened to trade. It is certainly no less navigable than the Middle Mekong or the Yangtzu above I-chang.

Salween, a district in the Tenasserim division of Lower Burma. Area, 2666 square miles. Population (1891), 31,439; (1901), 19,500. The district is in charge of a superintendent of police, and had 229 villages in 1898–99. The revenue of the district is incorporated with that of the Amherst district. The population in 1891 was made up of aboriginal tribes, Karens and Shans, 26,677, Buddhists and Jains 4322, Mahommedans 209, Hindus 173, Christians 58. Of the total area of 1,706,240 acres, 180,721 were cultivated in 1898–99. Of the remainder, about half of the acreage was uncultivable, and there were 98,240 acres of grass. The total rainfall in 1898–99 was 101·1 inches, recorded at Papun, which is the headquarters of the district.

Salzburg, a duchy and crownland in the Cisleithan part of the Austro-Hungarian monarchy. It lies between 40° 57′ 20″ and 48° 2′ N. and 12° 5′ and 13° 59′ E., and is bounded on the W. by Bavaria and Tirol, on the E. by Upper Austria and Styria, on the N. by Upper Austria and Bavaria, and on the S. by Carinthia and Tirol. It has an area of 2762 square miles. The surface is for the most part mountainous, the duchy lying on the northern slope of the Eastern Alps. Its most fertile portions belong to the series of longitudinal valleys of that region and the surrounding hills. It falls into three divisions: first, the high-lying valleys of the Hohe Tauern, which open on the depression of the river Salzach; then, to the south, the valleys and slopes of the limestone region; and finally, the undulating forelands. A portion of the Dachstein lies within the duchy. Salzburg is almost entirely within the watershed of the Danube, its principal river being the Salzach, a tributary of the Inn. The Enns and Mur rise in this province. Salzburg has some 200 lakes in all, of which the most important are Lake Zell, celebrated for its beautiful mountain panorama, and the Waller, Fuschel, and Traumen lakes. It has a total area of over 7000 acres of peat moss, and numerous mineral and thermal springs. The climate, although healthy, is very changeable, with great extremes of temperature—at Salzburg from 82·4° to 18·4° F. below zero—and heavy rains.

The mineral wealth of Salzburg includes salt (at Hallein), copper (at Mitterberg), iron-ore (at Werfen), and small quantities of gold, together with marble and precious stones. In 1898 the iron, gold, and copper ore amounted in value to about £18,500, and the salt to £183,100. Although a large portion of the soil is unproductive (13·71 per cent. occupied by glaciers, snow-fields, &c.), and 32·4 per cent. consists of forest, Salzburg is one of the principal pastoral regions of Austria. Of its total area, 28·9 per cent. consists of Alpine pastures available during the summer months, 4·95 per cent. of lowland pasturage, and 8·3 per cent. of meadows, while only 9·2 per cent. is arable. The chief resource is cattle-breeding and dairy-farming. Sheep, goats, and pigs are kept in large numbers. The great quantities of game constitute a considerable resource of the population, large numbers of whom are also engaged in the important timber trade. For administrative purposes the province is divided into six departments, of which the capital, Salzburg, is one and its environs the second. The other four are Hallein, St Johann, Tamsweg, and Zell-am-See. The inhabitants are a handsome and powerfully-built peasant race, very conservative not merely in the matter of religion, but in the maintenance of their traditional manners, customs, games, and national costume.

Population (1890), 173,510; (1900), 193,247, which is equivalent to 70 inhabitants per square mile. The proportion of females to males was 1019 to 1000 in 1890. The population is almost exclusively German and Catholic, the proportion of Czechs being less than one-third of 1 per cent., while the Jews and Protestants together are less than 1 per cent. In 1896 the marriage-rate was 8·13, the birth-rate 32·50 or, excluding still births, 31·54, and the death-rate 24·05. Of the births, 26·42 per cent. were illegitimate. The marriage- and birth-rates are rising, the death-rate and proportion of illegitimacy declining. The duchy sends 6 members to the Reichsrath. The 26 members of the Diet are all German. The archbishop is an *ex-officio* member of this body, in which the large landed proprietors have 5 seats, the towns and market-places 10, the chamber of commerce 2, and the country communes 8. Elementary education is comparatively advanced, particularly for an Alpine province. In 1890 the illiterates only amounted to 8·2 per cent., an improvement of 3·4 on the preceding census. There are 2 theological seminaries, 3 intermediate and 179 elementary schools, together with 30 technical, musical, and other special schools. In 1899 Salzburg had 236 miles of railway, 800 miles of roads, and 62 miles of waterway, of which 33 miles were only available for floating timber. At the same date there were 114 post and 73 telegraph offices, with 538 miles of line and 2433 miles of wire. (Æ. O'N.)

Salzburg, the capital of the Austrian duchy and crownland of the same name. Population (1890), 27,244, German and Catholic (505 Protestants and 146 Jews); (1900), 32,924, including garrison of 1931 men. The increasing popularity of Salzburg and the entire duchy as a summer resort constitutes a considerable addition to the resources of the town, which is manifest in the construction of new hotels, villas, &c., and in the improvement of the local means of communication. There has been a corresponding development of industry and trade. Among the improvements of the town are a park, a theatre, an art gallery, and baths.

Salzkammergut, a district in the south-west angle of Upper Austria. The annual production of salt (the principal industry) is increasing, and amounted in 1898 to about 90,000 tons, valued at £683,870. This was 26·3 per cent. of the total Austrian production.

Salzwedel, a town of Prussia, province Saxony, 106 miles by rail west by north of Berlin, half-way between Berlin and Bremen, on the navigable Jeetze, a tributary of the Elbe. In 1895 the town-hall was burnt down.

The industries include linen and damask weaving, tanning, brewing, and manufacture of pins, chemicals, machinery, &c. Population (1885), 8883; (1900), 10,175.

Samain, Albert (1859–1900), French poet, was born at Lille on 4th April 1859. He was educated at the lycée of that town, and on leaving it entered a bank as a clerk. He enjoyed no literary associations, and his talent developed slowly in solitude. About 1884 Samain went to Paris, having obtained a clerkship in the Préfecture de la Seine, which he held for most of his life. He presently began to send poems to the *Mercure de France*, and these attracted attention. In 1893 he allowed a friend to collect and print his earliest volume of poems, *Au Jardin de l'Infante*, in a very small edition. This led to the sudden recognition of his talent, and to applause from critics of widely different schools. In 1897 this book was reprinted in a more popular form, with the addition of a section entitled *L'Urne Penchée*. Samain's second volume, *Aux Flancs du Vase*, appeared in 1898. His health began to fail, and he withdrew to the country, where he died, in the neighbourhood of the village of Magny-les-Hameaux on 18th August 1900. A third volume of his poems, *Le Chariot d'Or*, appeared after his death, with a lyrical drama, *Polyphème*, 1901. The fame of Samain rapidly advanced when he was dead, and the general public awakened to the fact that this isolated writer, who formed few friendships and stood entirely aloof from all the Parisian cliques, was a poet of rare originality. He was neither of the old Parnassian nor of the new Symbolist school, but cultivated a delicate, languid beauty of imagery and an exquisite sense of verbal melody without attempting any revolution in prosody or identifying himself with any theory. Samain had no great range of talent, nor was he ambitious of many effects. His poetry has an extreme dignity and distinction in its somewhat morbid melancholy: it celebrates the magic of fading light in twilight gardens, when the shadows of fair ladies cross the dim lawns in a silence only broken by the murmur of a melancholy violin played somewhere far away. Samain's natural life was patiently spent in squalid conditions; he escaped from them into an imaginative world where all was of the most exquisite refinement. He has been compared to Watteau and Schumann; in his own art he bore some resemblance to Baudelaire, and to the English poet Arthur O'Shaughnessy. (E. G.)

Samara, a government of south-east Russia, on the left bank of the Lower Volga, with an area of 58,320 square miles. Its geology has been the subject of careful investigation, and much valuable information about the province has been acquired. It is chiefly built up of Carboniferous sandstones, conglomerates, clay slates, and limestones, representing mostly deep-sea deposits. The Permian formation appears along the rivers Sok and Samara, and is represented by limestones, sands, and marls containing gypsum, all of marine origin, and by continental deposits dating from the same period; sandstones impregnated with naphtha also occur. In the north these deposits are covered with "Variegated Marls" and with a variety of Triassic, Jurassic, and Cretaceous deposits. The Tertiary formation (Eocene) appears only at Novouzensk, the remainder of a vast sheet of this formation, which at one time covered all the region between the Volga and the Urals, having been removed during the Glacial period. Post-Tertiary Caspian deposits penetrate far into the province along the main valleys, and a thick layer of loess spreads in the north. Selenites, rock-crystal, and agates are found, as also copper ores, rock-salt, and sandstone extracted for building purposes.

The domiciled population of the province, which was only 1,388,500 in 1853, numbered, in 1897, 2,763,478, of whom 1,398,263 were women, and 159,485 lived in towns. The bulk of the population was composed of Great and Little Russians, who formed 69 per cent. of the inhabitants; Mordovians formed 8 per cent., Chuvashes and Votyaks 3 per cent., Germans 9 per cent., Tatars 9 per cent., and Bashkirs 2 per cent. Nonconformity is widely spread, and the official figures, which are much below the actual, give 91,400 adherents. Out of a total area of 37,299,400 acres, 4,143,800 acres belong to the Crown, 7,979,000 to private persons, and 22,486,700 acres to the peasants, who rent, moreover, about 6½ million acres. The area under cereal crops in 1900 was 9,623,700 acres, and the average annual yield in 1895–99 was: wheat 13,350,000 cwt., rye 10,518,000 cwt., oats 3,338,500 cwt., barley 768,000 cwt. —all cereal crops 31,813,000 cwt.; also potatoes 3,390,000 cwt. Water melons and sunflowers are extensively cultivated in fields, and gardening is widely engaged in, as also mustard and inferior qualities of tobacco. Cereals being grown in excess of the needs of the population, considerable quantities of cereals and flour are exported during the years of good crops (about 15,000,000 cwt. in 1896), as also are hemp-seed, linseed, and other oil-seeds, bran, &c. However, there are also years of total failure of the crops, when famine harasses the population. Cattle-breeding is widely spread, and there were in the province, in 1897, 553,300 horses, 484,030 horned cattle, 933,540 sheep, and 88,000 swine. Bee-culture is another pursuit that is widely followed, there being no less than 200,000 hives in the province. The export of poultry, especially of geese, has increased greatly. Manufacturing industries are still undeveloped, and all factories, employing an aggregate of 4700 workers, only showed a return of 11,500,000 roubles in 1898. Both the external and the internal trade are very flourishing, 247 fairs being held in the province every year; the chief are those at Novouzensk and Bugulma. Owing to the efforts of the local *zemstvos*, there are more than the average number of primary schools, namely, one school for every 1810 inhabitants; the total number of children receiving primary education is estimated at about 50,000. The province is divided into 7 districts, the chief towns of which are Samara (see below), Bugulma (7577), Buguruslan (12,141), Buzuluk (14,471), Nikolayevsk (12,524), Novo-Uzeñ (13,475), and Stavropol (5974). The Serghievsk sulphurous mineral springs, 57 miles from Buguruslan, are visited by numbers of patients. There are eleven springs, five of which yield 1,353,000 gallons for the baths per day.

Samara, the capital of the above province, 743 miles by rail south-east of Moscow. Its population, which was 63,479 in 1883, numbered 91,659 in 1897; and owing to its situation on the Volga, and at the head of the Siberian and Central Asian railways, it has acquired great commercial importance. All through the autumn and winter the peasants from the neighbouring country and the railways bring in considerable quantities of corn, the imports of which by rail and water alone are estimated at 154,700 tons, and the exports at 386,900 tons yearly; five large steam mills and one water mill are capable of grinding 128,000 tons of grain per annum. A considerable trade is also carried on in animal products, particularly hides, of which nearly 150,000 are exported every year. The port is the best on the Volga; and in 1897, 956 vessels, of 23,000 tons, entered, while 1491 vessels, of 306,000 tons, cleared. The railway returns for 1897 show that 170,000 tons of goods were imported by rail and 139,000 tons exported. Three great fairs are held every year. The city is well provided with schools and philanthropic institutions. It has three public libraries, several scientific societies, a good theatre, and a natural history and archæological museum; four newspapers are published.

Samarkand, a province of Russian Turkestan, of which it occupies the south-east corner, formed in 1887 out of the Zerafshan district. It has on the N. and N.-E. Syr-dariinsk, on the E. Ferghana, on the W. Bokhara, and on the S. the khanates of Hissar, Karateghin, and Darwaz. Its area is 26,627 square miles.

Physical features.

It is very hilly in the south, where it is intersected by a series of mountain ranges belonging to the Alai-Pamir system. The orography of this part of the Tian Shan is not yet well worked out, and they are traced on our maps mainly in accordance with the river system. Thus the high Hissar range is traced along the water-parting between the system of the Zerafshan and the upper tributaries of the Amu; another

high range, the Zerafshan, is traced in the same direction between the two parallel rivers, the Zerafshan and its tributary, the Yagnob; while a third range, often called Turkestan ridge, is traced from west to east parallel to the Zerafshan, on its northern bank. It is very probable, however, from what is known about the structure of the Tian Shan and the western Pamir, and their direction north-eastwards, that the three ranges referred to will, when they are better known, be found to be of a much more complicated character than is at present supposed. All three ranges are snowclad, and in their highest peaks reach altitudes of from 18,500 feet in the west to 22,000 feet in the east, while the passes over them, which afford difficult travelling as a rule, lie at altitudes of about 12,000 feet. Several Alpine lakes, such as Iskander-kul, 7000 feet high, have been found nestling under the high precipitous peaks.

The Alpine zone extends as far north as the 40th parallel, beyond which the province is covered with steppes, which are broken by only one range of mountains, Nuratyn-tau (also known as Sanzar and Malguzar, in its south-eastern, and Kara-tau in its north-western, extremity). This treeless range shoots for 160 miles, from the western Tian Shan, in a north-western direction, reaching 42° N. and 65° E.; it has a width of about 35 miles, and reaches altitudes up to 7000 feet; it is now pierced, in the renowned Sanzar gorge, or Tamerlane's Gate, by the railway leading from Samarkand to Tashkent. The other mountains in the province are well wooded, and it is estimated that nearly 4,500,000 acres are under forests. The north-western portion of the province is occupied by the Famine Steppe—which was for a long time an obstacle to the advance of the Russians southwards, but which probably might be irrigated—and by the desert of Kyzyl-kum, which is covered in places by moving sand. The Famine Steppe (not to be confounded with another desert of the same name, or Bek-pak-dala, to the west of Lake Balkhash) occupies nearly 5,000,000 acres, covered with a loess-like clay; the water is nearly always brackish, and can only be obtained from wells. In the spring the steppe is clothed with grass, and offers good pasture-grounds for the Kirghiz, but the grass withers as summer advances. Nearly 1,500,000 acres might, however, be irrigated and rendered available for the cultivation of the cotton-tree; and indeed a beginning has been made in that direction. The Kyzyl-kum (or Kizyl-kum) Steppe, which occupies 88,000 square miles, is covered partly with rocky hills, reaching an altitude of 3500 feet, and partly with salted clays, patches of prairie land, and sands. The sand is especially prevalent in the parts on the margin, where the moving *barkhans* (crescent-shaped sandhills) invade the Kara-kul oasis of Bokhara. The vegetation is very poor, as a rule; grass and flowers (tulips, *Rheum*, various Umbelliferæ, &c.) appear for a short time in the spring, but for the rest of the year only the bushes and the grasses characteristic of the steppes of Central Asia are to be seen, and the *barkhans* are covered merely with *Haloxylon ammodendron*, *Poligonum*, *Halimodendron*, *Atraphaxis*, and other steppe bushes; occasionally some *Stipa* grass is seen on the slopes of the sand-mounds, while *Artemisia* and *Tamarix* bushes cover the more compact sands. Water can only be obtained from wells, which sometimes have to be 140 feet deep. A few Kirghiz are the only inhabitants, and they are only to be found in the more hilly parts of the steppe.

The chief river of the province is the Zerafshan (see also ninth edition), which, under the name of Match, takes its rise in the Koksu mountain group where the Hissar range meets with the Alai ranges, near the Match Pass (13,800 feet). The glacier from which it flows is 16 miles long, and reaches by its lower end the altitude of 9000 feet; formerly, however, it crept at least 33 miles farther down the valley. The Zerafshan flows first westwards, in a wild gorge, with a fall of 37 feet per mile; near Varzaminor it receives the Fan-daria—formed by the junction of the Yagnob, which flows in a gorge parallel to the Upper Zerafshan, with the Iskander-daria—and pierces the Zerafshan range in a wild transversal gorge. It then bends northwards, receives the Kshtut and the Maghian from the left, and issues from the mountains into the steppes near Penjakent. After flowing past Samarkand, it divides into two branches (the Ak-daria and Kara-daria), 65 to 67 miles long, which unite near the Bokhara frontier; these surround the fertile, well watered, and well populated Miankal Island. To the west of Kermineh (altitude 970 feet) the Zerafshan bends to the south-west, flows past Bokhara, a few miles north of the city, and is lost in the sands 15 miles west of the Kara-kul villages. Its total length is 400 miles, for 260 of which it flows in the province of Samarkand. The current in the Zerafshan is so rapid that navigation is only possible by rafts; these are floated from Penjakent downwards. The quantity of water varies at the junction with the Maghian from 800 cubic feet per second to 27,800, or even 33,400, cubic feet per second in different periods of the year. The name of the Zerafshan, "distributer of gold," is fully explained by its value for purposes of irrigation: 83 main canals are drawn from it in the Samarkand province, watering 1200 square miles; while another 1640 square miles are watered in Bokhara by means of 43 main canals (of which the Shahrud brings to the Bokhara city 1610 cubic feet of water per second) and 939 secondary canals. The north-eastern portions of Samarkand are watered by the Syr-daria. One of the lakes, the Tuz-khan (40 miles from Jizak) yields about 1300 tons of salt.

Climate. The climate is very dry and continental in character. The average temperature for the year is 55° F. at Samarkand, and 58° at Khojent and Jizak; but the average temperature for the winter is only 34°, and frosts of 4° and 11° have been experienced at Samarkand and Khojent respectively; on the other hand, the average temperature for July is 79° at Samarkand and 85° at Khojent and Jizak. The total precipitation (including snow in winter) is only 6·4 inches at Khojent, 12 inches at Samarkand and Khojent, and 24 inches at Jizak. The hilly tracts have a healthy climate, but malaria prevails in the lower regions and the mosquitoes are quite a plague in summer.

Inhabitants, industries, &c. In 1897 the domiciled population numbered 857,847, of whom 384,392 were women, and 135,568 lived in towns. The Uzbegs form over two-thirds of the population, and after them the Kirghiz and Tajiks are the most numerous; Jews, Tsigans, Tatars, Afghans, and Hindus are also met with. The Russians had 9 villages (2000 inhabitants) on the Syr-daria, in the Famine Steppe, in 1897.

In 1898 nearly 1,000,000 acres were irrigated, and about 800,000 acres half-irrigated. The chief crops in 1897 were: wheat 4,156,000 cwt., rice 2,584,000 cwt., and barley 1,240,000 cwt. Sorghum, millet, Indian corn, peas, lentils, haricots, flax, hemp, poppy, lucerne, madder, tobacco, melons, and mushrooms are also grown. Agriculture has reached a high level of perfection, and two crops are often taken from the same land in one season. Over 1100 tons of raw cotton, chiefly American, were obtained in 1897, and 21,000 acres were under vineyards. Sericulture prospers, especially in the Khojent district (15,100 cwt. of raw cocoons). The forests have been already referred to. Plantations of trees near Samarkand have proved very successful. Cattle-breeding forms the chief occupation of the Kirghiz, and there were in 1897 in the province 82,760 horses, 170,890 cattle, 1,087,500 sheep and goats, 39,500 donkeys, and 45,800 camels. Weaving, saddlery, boot-making, tanneries, oil works, and metal works are widely spread in the villages and towns, while the nomad Kirghiz excel in making felt goods and carpets. But all these industries are simply domestic in character, and of large establishments there are only 1 glass works, 24 cotton-cleaning works, 3 steam flour mills, and a few distilleries. Mining is in its infancy; but some coal (5000 tons), sulphur, ammonia, and gypsum is obtained. Trade is considerable, the chief exports being rice, raw cotton, raisins, dried fruit, nuts, wine, and silk. The Central Asian Railway now crosses the province from Bokhara to Samarkand and Tashkent; a branch line runs to Andijan in Fergana.

Education is at a low ebb. There were only 9 schools for Russians in 1899, attended by 350 boys and 240 girls; 8 mixed schools, with evening classes, had 259 pupils; and 1785 Mahommedan schools, about 17,000 pupils. The province is divided into 4 districts, the chief towns of which are: Samarkand (see below), Fort Jizak (16,041), Kattykurgan (10,083), and Khojent, or Hodjent (30,076). (P. A. K.)

Samarkand, the capital of the above province, situated in 39° 39′ N., 97° 18′ E., 5 miles from the left bank of the Zerafshan, at an altitude of 2260 feet. It is connected by rail with Krasnovodsk (938 miles), *viâ* Merv, and with Tashkent (126 miles). In 1897 the population numbered about 40,000 in the native city, and about 15,000 in the new Russian town, inclusive of the military (80 per cent. Russians). Out of the total of 54,900, only 23,194 were women. The Russian town is well built, with broad boulevards, gardens, and a park. Although the building of the railway as far as Tashkent and Andijan has diminished the commercial importance of Samarkand, it still remains an important depôt for the export of raw cotton, rice, raw silk, silk goods (blankets), leather, fruit, horses, and wine.

Sambalpur, a town and district of British India, in the Chhattisgarh division of the Central Provinces. The town is on the left bank of the river Mahanadi, 495 feet above the sea, and has a railway station. Population (1881), 13,939; (1891), 14,571. There is a ruined fort, with old temples. The cantonment contains a wing of a Madras native infantry regiment. The Government high school had 444 pupils in 1896–97. There is considerable trade.

The district of SAMBALPUR has an area of 4948 square miles. Population (1881), 693,499; (1891), 796,413, showing an increase of 15 per cent., which has been continuous since 1872. Average density, 161 persons per square mile. In 1901 the population was 829,823, showing a further increase of 4 per cent. The land revenue and rates are Rs.2,06,334, the incidence of assessment being little more than two annas per acre; cultivated area (1897–98), 1,117,439 acres, of which 18,712 were irrigated from tanks, &c.; number of police, 491; boys at school (1896–97), 8137, being 13·6 per cent. of the male population of school-going age; registered death-rate (1897), 30 per thousand, compared with 38 for the province generally. This last figure is sufficient to show that Sambalpur entirely escaped the famine of 1896–97, which indeed can be said to have brought prosperity to the district by causing high prices for a good rice crop, rice being the staple of cultivation. It was almost equally fortunate in 1900. The main line of the Bengal-Nagpur Railway runs along the northern border of the district, with a branch (30 miles) south to Sambalpur town.

Sambor, the chief town of a government district in Galicia, situated on the Dniester, to the south-west of Lemberg. The industries consist in brewing, corn-milling, and the manufacture of damask silk, oil and salt from the brine wells in the neighbourhood. There is a considerable trade in flax, hemp, eggs, and cattle. Population (1890), 14,324; (1900), 17,027, chiefly Polish and Roman Catholic (estimated at 9 per cent. Ruthenians and 3 per cent. German; 29 per cent. Jewish and 17 per cent. Greek Catholic).

Samnán, a small province of Persia, which, including the city and district of Damghán, is generally known as "Samnán va Damghán." It is bounded on the W. by the districts of Khár (the ancient Choara) and Firúzkúh, on the N. by Mázandarán, and on the E. by Sháhrúd and Bostám. In the S. it extends to beyond the oasis of Jendek in the desert north of Yezd. Its northern part is still known as Komush, or Komish, the ancient Commisene. The revenue which the State derives from the whole province amounts to about £7000 per annum.

Samnán, the capital of the above province, situated 145 miles east of Tehran, on the high road thence to Mashhad, at an altitude of 3740 feet and in 35° 34′ N., and 53° 22′ E. It has a population of about 10,000, post and telegraph offices, and a fine minaret, 100 feet high and some inches out of the perpendicular, built in the 12th century. It exports large quantities of pistachios and almonds and some coarse tobacco grown in the district. In the town and some of the neighbouring villages a dialect with many old Persian forms and resembling the Mázandarán dialect is spoken.

A. Houtum-Schindler, "Bericht über d. Samnán Dialect," *Zeitsch. d. Morgenl. Gesellschaft*, vol. xxxii., 1878.

Samoa, an archipelago which occupies a somewhat central position in the Pacific Ocean, about 150 miles north of Tonga and nearly midway between the New Hebrides and Tahiti, 1600 miles from Auckland (New Zealand), 2410 from Sydney, and 4200 from San Francisco. The group, which was discovered by Bougainville, and by him named the Navigators' Islands, comprises altogether fourteen volcanic islands disposed in the direction from west to east between 13°–15° S. and 168°–173° W., with a total area of 1100 square miles, and a population (1900) of 35,000, all Polynesians except about 500 Europeans (British, American, German). The chief members of the group are:—

	Area in sq. miles.	Population.
Savaii	660	12,500
Upolu	340	16,600
Tutuila	54	3000
Manua, with Ofu and Olosenga .	26	2000

All are forest-clad and mountainous, with several extinct or quiescent craters rising from 2000 feet in Upolu to 4000 (Mua) in Savaii, and the peak of Vaea in the former island will always be associated with the memory of the late R. L. Stevenson, whose monument crowns the summit. Although there are now no active cones, Upolu has in comparatively recent times been subject to violent volcanic disturbances. Several parts of the islands are strewn with modern eruptive matter, and according to a local tradition, the last explosion occurred not more than 200 years ago. In 1866 a submarine volcano near the islet of Olosenga was the scene of a violent commotion, discharging rocks and mud to a height of 2000 feet, and discolouring the surrounding waters for many miles in all directions. The whole group is abundantly watered, and such is the fertility of the igneous soil that the means of subsistence are said to be more easily raised than in any other part of the world. But the archipelago lies in the track of the fierce hurricanes which occur usually between the months of December and April.

Of the extremely limited Samoan fauna, consisting mainly of an indigenous rat, four species of snakes, and a few birds, the most interesting member is the *Didunculus strigirostris*, a ground pigeon of iridescent greenish-black and bright chestnut plumage, which forms a link between the extinct dodo and the living African *Treroninæ*. The Samoans are typical members of the large brown Polynesian race (see POLYNESIA), and according to some ethnologists Savaii was the cradle and centre of dispersion of these aborigines over the Pacific Ocean from Hawaii to New Zealand. This view is largely based on the fact that Samoan is the most archaic of all the Polynesian tongues, and still preserves the organic letter *s*, which becomes *h* or disappears in nearly all the other archipelagoes. Thus the term *Savaii* itself, originally *Savaiki*, is supposed to have been carried by the Samoan wanderers over the ocean to Tahiti, New Zealand, the Marquesas and Sandwich groups, where it still survives in such variant forms as *Havaii*, *Hawaiki*, *Havaiki*, and *Hawaii*. The theory is supported by the local traditions, legends, and cosmogonies in which Polynesian oral literature abounds.

The exports from Samoa (chiefly copra) were valued in 1897 at £48,000 and the imports at £66,000 (£35,000 from British empire), while of the shipping (82,000 tons) about half was British, and 32,000 tons were American. Apia, the capital and chief centre of trade, lies in the German island of Upolu; but Pago Pago (Pango Pango) in Tutuila, is used as a coaling station for the United States Navy in the Central Pacific waters. (A. H. K.)

History.—Subsequently to the year 1881, the Samoan Islands assumed a much greater international importance than before. Their situation in the direct pathway of commerce from the United States to Australia, their central position in the South Pacific, and the fact that European Powers had acquired nearly all other groups of islands and valuable harbours in the South Pacific, made Samoa a desirable possession to any maritime Power. Under a political arrangement between Great Britain, Germany, and the United States, no single Power was to appropriate them. But in 1887 and 1888 civil war prevailed, the Germans supporting their candidate, the native Tamasese, as the lawful king, and the British and American residents of the islands supporting Malietoa. After the latter had been deported by the Germans, the British and American support was transferred to his successor, Mataafa. In the course of the fighting which ensued, some fifty German sailors and marines were killed or wounded by the adherents of Mataafa. A conference between the three Powers was thereupon held at Berlin, and a treaty was executed by those Powers and by Samoa, under date 14th June 1889, by virtue of which the independence and autonomy of the islands were guaranteed,

Malietoa was restored as king, and the three Powers constituted themselves practically a protectorate over Samoa, and provided a chief justice and a president of the municipality of Apia, to be by them appointed, to aid in carrying out the provisions of the treaty. The government was administered under this treaty, but with considerable friction, until the end of 1898, when, upon the death of Malietoa, two rival candidates for the throne appeared, and the chief justice selected by the three Powers decided against the claims of Mataafa, one of the rival claimants, and in favour of a boy, Malietoa Tanu, a relative of the deceased Malietoa. Civil war immediately ensued, in which several American and British officers and sailors were slain by the natives, the Germans upholding the claims of Mataafa, and the British and Americans supporting the rival candidate. The three Powers thereupon sent a commission to Samoa to investigate and adjust the difficulties. The situation, however, was found to be so complicated and embarrassing that, early in the year 1900, the so-called Berlin treaty was abrogated, Great Britain withdrew her claims to any portion of the islands and received compensation from Germany by concessions in other parts of the world, and the United States withdrew from all the islands west of Tutuila, leaving Upolu and Savaii and their outlying islands for exclusive German control, the United States retaining the island of Tutuila and the small islands near to it. The Germans immediately made a Crown colony of their new possessions, and appointed a governor for their control. The United States, having received the written assent of all the chiefs of the islands that fell to it by the partition, assumed sovereignty over them and proceeded, as we have already seen, to erect a well-equipped coaling station in the harbour of Pago Pago.

On 16th March 1889 a hurricane prevailed in the South Pacific, and the heavy tidal waves swept into the harbour of Apia and created great havoc among the warships of the three Powers congregated there. The American warship *Nipsic* was cast upon the beach, but was afterwards floated and saved. Two other United States warships *Trenton* and *Vandalia*, were beaten to pieces upon the coral reef, and sank; and the German warships *Olga* and *Eber* were wrecked. Great loss of life ensued. The British warship *Calliope* was in the harbour, but succeeded in getting up steam and, standing out to sea, escaped destruction. It was fitting that R. L. Stevenson's should be the pen to describe in vivid and dramatic language the heroism of the captain and crew.

The Germans had the largest financial interests in the islands for many years, and acquired by the new treaty the most valuable portions thereof. The particular value of Tutuila lies in the excellence of the harbour of Pago Pago and its central position in the South Pacific. The Samoan climate is equable and delightful, the temperature ranging from 60° to 90° F., the average for summer being about 5° higher than that for winter. The regularity and strength of the trade winds temper the heat and, with the picturesque native life, make the islands an attractive place of residence for Europeans. Robert Louis Stevenson passed his last years there, and his body lies buried on the summit of Mount Vaea, overlooking Vailima, his South Sea home, and the coral-encircled harbour of Apia. The steamers of the Oceanic Steamship Company of San Francisco all touch at the group in their regular trips to Sydney, and communication is also furnished once a fortnight by the Union Steamship Company of New Zealand. (H. C. I.)

Samos, an island of the Aegean, separated from the Anatolian coast by a strait less than a mile wide. It is tributary to Turkey in the sum of £2700 annually, but otherwise is practically an independent principality, governed by a prince of Greek nationality nominated by the Porte. As chief of the executive power the prince is assisted by a senate of four members, chosen by him out of eight candidates nominated by the four districts of the island—Vathy, Chora, Marathocumbo, and Carlovasi. The legislative power belongs to a chamber of 36 deputies, presided over by the metropolitan. The Budget estimate for receipts and expenses for 1900–01 was £31,848. There is no public debt. The seat of the Government is Vathy (5000). There is a telephone service. The island is remarkably fertile, and a great portion of it is covered with vineyards, the wine from the Vathy grapes enjoying a specially high reputation. There are three ports: Vathy, Tegani, and Carlovasi. They were visited in 1899 by 1402 steamships, of 304,250 tons, as compared with 1178, of 287,095 tons, in 1895, and by 3604 sailing vessels, of 449,560 tons, as compared with 3562, of 252,897 tons, in 1895. In 1899 the ships belonging to the principality numbered 368, of 3491 tons, as compared with 306, of 3562 tons, in 1895. The total value of the exports in 1900 was £211,000, as compared with £164,876 in 1895, and of the imports £213,000, as compared with £173,545. The principal exports are wine (£140,000 in 1900 and £13,698 in 1896), olive oil (about £20,000), raisins (£25,000), locust beans, and tobacco (£20,000). The population in 1900 was 54,830, not comprising 15,000 natives of Samos inhabiting the adjoining coasts. The predominant religion is the Orthodox Greek, the metropolitan district including Samos and Icama. In 1900 there were 634 foreigners on the island (523 Hellenes, 13 Germans, 29 French, 28 Austrians, and 24 of other nationalities). In 1881 the remarkable aqueduct and tunnel of Eupalinus, cut through the mountain behind the ancient capital for a distance of about 1400 yards, was discovered.

See TOZER. *Islands of the Ægean*, 1890.

Samosata, now SAMSAT, Turkey in Asia, altitude 1500 feet, the capital of the Seleucid kings of Commagene, and a place of strategical importance. The town was situated on a broad plain, on the right bank of the Euphrates, where there is the first easy passage across the river below the point at which it leaves the mountains. Samosata, according to Strabo, was the starting-point of the great road to India, and it was probably the place at which the Persian "Royal Road" crossed the Euphrates. Taken by Mark Antony, it was finally included in the Roman empire by Vespasian, and was the birthplace of Lucian and of the heretical bishop Paul, who maintained the simple humanity of Christ. A Kúrdish village occupies a corner of the site of the ancient town.

Samothrace (Turkish, *Semadrek*), the "Thracian Samos," a rugged mountainous island in the Aegean Sea, altitude 5248 feet, situated 20 miles south of Dedeagach, on the coast of Thrace. The island is a kaza of the Lemnos sanjak, and has a population of 3500, nearly all Greek. On the north coast are much frequented hot sulphur springs. In 1873 and 1875 excavations were carried out under the auspices of the Austrian Government with interesting results.

Sampson, William Thomas (1840–1902), American naval commander, was born at Palmyra, New York, 9th February 1840, and graduated at the head of his class from the U.S. Naval Academy in 1861. He served in the *Potomac* in 1861, in which year he was promoted to master, and in the following year was made

lieutenant. He was executive officer in the *Patapsco* when she was blown up in Charleston Harbour, 10th January 1865. Varied service on distant stations followed, with promotion to the rank of lieutenant-commander in 1866 and commander in 1874. He was a member of the International Prime Meridian and Time Conference, 1884, and was afterwards a member of the Board of Fortifications. He was superintendent of the Naval Academy from 1886 to 1890, being meanwhile promoted to captain, and serving as delegate at the International Maritime Conference at Washington, 1889.

From the first Sampson threw himself energetically into the work of developing the United States navy. The construction of the gun factory was in his charge, and it fell under his absolute control when he became chief of the Bureau of Ordnance, which position he held until he was appointed to the *Iowa*, shortly before the war with Spain. For a number of years from 1892 onwards all the guns built for the American navy were constructed under his supervision, and the heavier guns were from his own design. It is said that 95 per cent. of the guns employed in the Spanish–American war had been made under his superintendence. He was a member of the Advisory Board and the Board on Construction for five years up to 1897, and his influence was felt not only in the matter of general design, but still more decisively in regard to the distribution of guns and armour. Equally important was his influence in the training of the *personnel* of the navy. He superintended the gunnery training and prepared a new drill-book for the fleet.

When the *Maine* was blown up in Havana harbour in February 1898, Sampson, then a captain, was one of the court of inquiry appointed to investigate the cause of the disaster. At the outbreak of the war with Spain he was placed in charge of the North Atlantic squadron, and conducted the blockade of Cuba. When it was known that Admiral Cervera, with a Spanish fleet, had left the Cape Verde Islands, Sampson withdrew a force from the blockade to cruise in the Windward Passage, and made an attack upon the forts at San Juan, Porto Rico. After his return to the coast of Cuba, he conducted the blockade of Santiago, and the ships under his command destroyed the Spanish vessels when they issued from the harbour of Santiago and attempted to escape. Sampson himself was not actually present at the battle, having started for Guantanamo just before it began. He was, however, only a few miles away at the most, and reached the scene of battle as the last Spanish vessel surrendered, and the engagement was fought in accordance with his instructions. He was promoted to commodore in 1898, to rear-admiral, 3rd March 1899, and was made commandant of the Boston (Charlestown) Navy Yard in October of the same year. He died 6th of May 1902. Admiral Sampson rose from a comparatively humble station in life by distinguished ability, power of command, and sheer force of character. He exercised an influence in every department of naval activity, won the high professional esteem of his brother officers, and was held in warm regard by all but a small section of his countrymen. He was the man whose personal energy entered more largely than that of any other into the construction, armament, organization, and fighting qualities of the American fleet as constituted in the Spanish–American war.

Samshui, a treaty port in the province of Kwangtung, China, situated on the left bank of the river West, 99 miles from Canton. Its position is at the junction of the rivers North and West, and is favourably situated as a distributing centre for foreign goods. The town itself is of no importance, and the trade, which is almost entirely with Hong Kong, so far is not great. The imports by steamer in 1899 amounted to H. taels 2,967,000 (£445,000), but in 1900 to only £355,400. This, however, is only part of the trade, as the country abounds in creeks suitable for junk navigation.

Samsún, the ancient Amisus, the chief town of the Janik sanjak of the Trebizond vilayet of Asiatic Turkey, situated on the south coast of the Black Sea between the deltas of the Kizil and Yeshil Irmaks, and connected by metalled roads with Sivas and Kaisaríeh, and by sea with Constantinople. It is a thriving town, of considerable importance as the outlet for the trade of the Sivas vilayet. Steamers lie about a mile from the shore in an open roadstead, and in winter landing is sometimes impossible. In 1900 the exports — cereals, flour, tobacco, &c. — were valued at £759,760, and the imports—cotton stuffs, iron, &c.—at £468,230. The population rose from about 3000 in 1860 to about 13,000, of whom 10,000 are Christians. Amisus, which stood on a promontory about 1½ miles north-west of Samsún, was, next to Sinope, the most flourishing of the Greek settlements on the Euxine, and under the kings of Pontus it was a rich trading town. By the 1st century A.D. it had displaced Sinope as the northern port of the great trade route from Central Asia, and later it was one of the chief towns of the Comneni of Trebizond. There are still a few remains of the Greek settlement.

Sanaa, capital of Yemen. The journeys of General Haig in January 1887, of Professor Schweinfurth in 1888–89, and of Harris in 1892, have thrown some new light on the physiography of Yemen, and have added some interesting details to our previous knowledge of Sanaa. According to Haig, Sanaa is situated 140 miles to the north and east of the Red Sea port of Hodeida and 260 miles north of Aden. The co-ordinate position in latitude and longitude of Sanaa is most uncertain. The best authorities seem to agree that it is about 44° 30′ E. and 15° 20′ N., but these values have never been satisfactorily verified. Haig makes its altitude to be 7800 feet above sea-level, but Harris, following Glaser, fixes it at 7300. It is approached from the west by the Turkish military road from Hodeida, passing through a succession of steppes and gently sloping valleys, terraced and cultivated, between low hills of trap, a fall of 2000 feet occurring between the western plateau and the open plain of Sanaa.

Turkish occupation and misrule are the predominant features throughout the town. The fortress of Jebal Nigcim has been repaired, and from its citadel, on one of the spurs of the hill, the guns are significantly pointing into the streets of the city. There is much of the atmosphere of a second-class Egyptian port about Sanaa. Restaurants are to be found about the central square, and cafés adjoin the numerous khans or caravanserais. The old palace of the Imams, which is now occupied by the Turkish governor, is whitewashed, and the walls of its rooms are picked out with an inferior style of French decoration. The most flourishing community in Sanaa appear to be the Jews, of whom there are about 20,000 (the total population is estimated at 45,000), who live on distinctly better terms with the Turks than the Arab inhabitants do. They possess 23 synagogues and 20 schools, with 700 boys in them. The whole male population can read, but few of the females. The boys are taught to be masons and artificers, and are preferred to Mahommedans as servants by the few Europeans who live at Sanaa. The pretentious style of the houses seems to have struck all travellers. They are often stone-built (in colour patterns) and three or four storeys high, the upper storeys projecting over the street, with long narrow windows filled in with

stained glass. The streets of the bazaars are winding and narrow, and are arranged (as is usual in Asiatic towns) with reference to particular crafts and trades, each street maintaining its own special business. The manufacture of arms and jewellery, trade in silks and cottons, china, and hardware are all well represented, the jewellery (especially jewelled sheaths) being a speciality of Sanaa.

AUTHORITIES.—HAIG. *R.G.S. Proceedings*, vol. xi.—HARRIS. *Journey through Yemen.* London, 1893. — SCHWEINFURTH. *R.G.S. Proceedings*, vol. xi.—KAY. *Omrah's History of Yemen.* London, 1892.

San Antonio, a city of Texas, U.S.A., capital of Bexar county. It is the largest city in the state, and is situated in 29° 25′ N., 98° 25′ W., on the river San Antonio, at the mouth of the San Pedro, in the southern part of the state, at an altitude of 645 feet. The present city combines three different elements of growth: the old Mexican town, in the district known as Chihuahua, west of the San Pedro; San Antonio proper, including the business part of the city, between the rivers San Antonio and San Pedro, inhabited mainly by Americans; and the portion east of the river San Antonio, settled mainly by Germans. The city has a level site on both banks of the river, its street plan is irregular, and it is divided into eight wards. It has an abundant water-supply from artesian wells and from the San Antonio, and it is well paved and sewered. It is the intersecting point of four railways, the Galveston, Harrisburg, and San Antonio, the International and Great Northern, the San Antonio and Aransas Pass, and the San Antonio and Gulf, making it the most important commercial centre in this part of the state. Its manufacturing interests also are large. In 1900 the city contained 312 manufacturing establishments, with a total capital of $4,252,197. They employed 3073 hands, and the product was valued at $6,821,297. The assessed valuation of property, real and personal, for 1900, was $31,879,369, the net debt $2,015,449, and the rate of taxation $27.00 per $1000.

Within the city is a United States arsenal in spacious grounds, and a mile north of the city is a United States military post, known as Fort Sam Houston. The town contains many fine buildings and many historical relics. Among the former are the new court house, the city hall, and the cathedral of San Fernando. Among the latter the first in interest is the Alamo, an adobe church, which in the Texan War for Independence, in 1836, a garrison of 175 men defended for 12 days against the assaults of 4000 Mexicans, and finally perished to a man. In and about the city are several of the early Spanish mission buildings, still in a good state of preservation. The city is the site of St Louis College, a Roman Catholic institution, opened in 1894, which five years later had a faculty numbering 15 and was attended by 110 students. Population (1890), 37,673; (1900), 53,321, of whom 9348 were foreign-born and 7538 negroes.

San Antonio de los Baños, a small Cuban town, with well-built houses, about 23 miles from Havana, on the road to Guanajay. It has mineral springs and baths, and is frequented as a summer resort by the people of Havana. The population in 1899 was 8178.

San Bernardino, a city of California, U.S.A., capital of San Bernardino county. It is situated in 34° 07′, N., 117° 17′ W., in the valley at the south base of the San Bernardino range, in southern California, at an altitude of 1048 feet. The broad streets are well shaded and bordered with the beautiful grounds of private residences. It is on the Southern California and the Southern Pacific railways, in the fruit region of southern California, and is surrounded by orange and lemon groves, which furnish a large part of its trade. Population (1890), 4012; (1900), 6150, of whom 873 were foreign-born and 166 coloured.

Sancti Spiritus, a Cuban city in Santa Clara province, situated in the centre of a region principally devoted to grazing. It was one of the seven original municipalities founded by Diego Velasquez. The population in 1899 was 12,696.

Sandbach, a market-town, urban district (1894), and parish, Cheshire, England, in the Crewe parliamentary division of the county, 5 miles north-east of Crewe by rail, on the Trent and Mersey canal. The urban district council owns the water-works, constructed at a cost of £7000. In 1889 a town and market hall was erected at a cost of £5000, and in 1891 the old town-hall was demolished. The population of the urban district was in (1881), 5493; (1901), 5556.

Sandefjord, the oldest and most famous spa in Norway, county of Jarlsberg and Laurvik, 53 miles south-south-west of Christiania by rail, with sulphur and other baths and a bath-house. Population (1891), 4238; (1900), 4847.

Sandgate, a town, railway station, and bathing-place, Kent, England, in the Eastern or St Augustine's parliamentary division of the county, 1½ miles west of Folkestone, and about 3 miles east of Hythe with which it is connected by tramway (belonging to the South-Eastern and Chatham Railway) running along the shore. The camp of Shorncliffe, an important military station, lies north of the village on a plateau. It forms three sides of a square and can accommodate more than 5000 troops. A convalescent home with accommodation for 230 patients, erected at a cost of £20,000, was opened in 1897. The population of the urban district in 1891 was 1756, exclusive of 2822 officers and soldiers in camp; in 1901, 2023.

Sandhurst, a parish, Berkshire, England, in the Eastern or Wokingham parliamentary division of the county, 4½ miles south-east of Wokingham by rail, and 1¼ miles from Wellington College station. The Royal Military College was settled here in 1812 in beautiful park-like grounds. Population (1901), 2386.

Sandhurst. See BENDIGO.

San Diego, a city and seaport of California, U.S.A., capital of San Diego county. It is situated on the Pacific coast, near the southern boundary of the state, on a harbour formed by a sand-spit from the south, the entrance being around its northern end. The site is nearly level, with a slight slope towards the harbour; there is a water-supply as well as other municipal improvements. The principal railway to the city is the Southern California, in addition to which there are three small local lines of steam railway, besides trolley lines. On a sand-spit enclosing the harbour has sprung up, around the well-known Coronado hotel, a village of fine residences, known as Coronado. This is connected with the city on the mainland by ferry. Population (1890), 16,159; (1900), 17,700, of whom 3768 were foreign-born and 623 were coloured, including 313 negroes.

Sandoway, a district in the south of the Arakan division of Lower Burma. Population (1891) 78,425; (1901) 90,200. Area, 3784 square miles. Of the population in 1891, 69,250 were Buddhists and Jains; 3128 Mahommedans; 5452 aborigines, mostly Chins; 175 Hindus; and 420 Christians, 384 of whom were natives. Of a total area of 2,421,760 acres, only 61,719 bore crops

in 1898–99, but 2,350,000 were uncultivable, and apart from fallow only 8233 were available for cultivation. The rainfall in 1898–99 was 217·7 inches. Except 1974 acres of tobacco, all the cultivation is rice. The chief town, Sandoway, had a population in 1891 of 2537 persons. It has a municipal committee of eight members, six of whom are elective, four being Burmese and two Mussulmans.

Sandur, or Sundoor, a petty state of southern India, surrounded by the Madras district of Bellary. Area, 161 square miles. Population (1891), 11,388; (1901), 11,205. The chief, whose title is Raja, is a Maratha, tracing back his descent to the 17th century. In 1897–98 the estimated gross revenue was Rs.50,000. On the western border is a hill range of the same name, which contains the military sanitarium of Ramanmalai.

Sandusky, a city of Ohio, U.S.A., the capital of Erie county. It is situated in 41° 32′ N., 82° 42′ W., on Sandusky Bay, an arm of Lake Erie, in the northern part of the state, at an altitude of 596 feet. It has broad streets, and a good water-supply and sewerage systems. It is traversed by five railways, the Baltimore and Ohio, the Cleveland, Cincinnati, Chicago, and St Louis, the Columbus, Sandusky, and Hocking, the Lake Erie and Western, and the Lake Shore and Michigan Southern. These, with vessels on the Lakes, give the city a large commerce, particularly in coal, iron-ore, grain, fruit, and fish. Its manufactures are not large, and consist in great part of agricultural implements. Population (1890), 18,471; (1900), 19,664, of whom 4002 were foreign-born and 295 negroes.

Sandwich, a municipal borough, cinque port, and market-town in the St Augustine parliamentary division of Kent, England, on the Stour, 5 miles north of Deal, with a station on the South-Eastern and Chatham Railway. St Peter's church has been restored and modern grammar-school buildings have been erected. Corporation water-works were constructed in 1894. The St George's golf-links are amongst the finest in England, and are one of the three upon which the Championship contests are held. Area, 756 acres. Population (1881), 2846; (1901), 3174.

Sandys, Frederick (1832–——), English painter and draughtsman, was born at Norwich on 1st May 1832, and received his earliest lessons in art from his father, who was himself a painter. His early studies show that he had a natural gift for careful and beautiful drawing, and that he sought after absolute sincerity of presentment. It was to be expected, therefore, that he would sooner or later join himself to those who were associated with the Pre-Raphaelite Brotherhood, the one great movement in British art during the 19th century. At an early gathering of the P.-R. B. in 1848 Millais showed, as examples of sound work, engravings after the frescoes in the Campo Santo at Pisa by Orcagna, Benozzo Gozzoli, and other painters of the *quattrocento*, and said, "This is what the Pre-Raphaelite clique should follow." Sandys worked along the same lines as Millais, Madox Brown, Holman Hunt, and Rossetti, and it was not long before he was recognized as one of the most promising of the young artists of the day. He first met Rossetti in 1857, and carried away with him the impression of the painter-poet's features, which he reproduced so cleverly in "A Nightmare," a caricature of "Sir Isumbras at the Ford," by Millais. Both the picture and the skit upon it by Sandys attracted much attention in 1857. The caricaturist turned the horse of Sir Isumbras into a donkey labelled "J. R., Oxon." (John Ruskin). Upon it were seated Millais himself—an excellent likeness of him in his handsome youth—in the character of the knight, with Rossetti and Holman Hunt as the two children, one before and one behind. The humour was chiefly directed against Ruskin, but all concerned took it in good part. Rossetti and Sandys, in fact, became intimate friends, and for about a year and a quarter, ending in the summer of 1867, Sandys lived with Rossetti as one of his numerous guests at Tudor House (now called Queen's House), in Cheyne Walk, Chelsea. By this time Sandys was known as a painter of remarkable gifts. He had begun by drawing for *Once a Week*, the *Cornhill Magazine*, *Good Words*, and the other periodicals which contained the best illustration work that has ever been done in England. Among the men who were then drawing for woodcuts, and creating a body of work which was not until long afterwards recognized at its full worth, Sandys took a leading place. He drew only in the magazines. No books illustrated by him can be traced. So his exquisite draughtsmanship has to be sought for in the old bound-up periodical volumes which are now hunted by collectors, or in publications such as Dalziel's *Bible Gallery* and the *Cornhill Gallery* and books of drawings, with verses attached to them, made to lie upon the drawing-room tables of those who had for the most part no idea of their merits. Every drawing Sandys made was a work of art, and many of them were so faithfully engraved that they are worthy of the collector's portfolio. Early in the 'sixties he began to exhibit the paintings which introduced him to a wider public and set the seal upon his fame. The best known of these are "Vivien," "Morgan le Fay," "Cassandra," and "Medea."

The rejection of "Medea" by the hanging committee of the Royal Academy aroused Rossetti to burning indignation. In a letter of April 1868 he wrote: "Sandys's picture of Medea has been turned out of the R.A.—a most disgraceful affair." However, it was exhibited in the following year and won the warm admiration of the judicious. Sandys never became a popular painter. His imagination was too fine for that. He painted little, and the dominant influence upon his art was the influence exercised by lofty conceptions of tragic power. There was in it a sombre intensity and an almost stern beauty which lifted it far above the ideals of the crowd. When he chose classic subjects, he treated them with Gothic freedom from convention and with a passionate determination to lay bare the human soul. The Scandinavian Sagas and the *Morte d'Arthur* gave him subjects after his own heart. "The Valkyrie" and "Morgan le Fay" represent his work at its very best. His portraits also had qualities far more in common with Gothic art than with any other school. His oil-paintings were of a marvellous fidelity, and have been said to be the finest in their way seen in England since the days of Holbein. He made as well a number of chalk drawings of famous men of letters, including Tennyson, Browning, Matthew Arnold, and James Russell Lowell.

See also Esther Wood. *The Artist* (Winter number), 1896, finely illustrated; which also refers to some other sources of information concerning Sandys.

San Fernando, a town of Spain, province of Cadiz, south-east of the capital, with a station on the Seville to Cadiz Railway. Population (1887), 23,756; (1897), 28,951. There are a very handsome, large town-hall, several storeys high, with marble staircases and stately columns, a good hospital for both sexes, a bull-ring, and a fish-market. The place is famous for its private schools and academies, which prepare boys for the navy. Between San Fernando and Puerto Real there is a tract of country studded with gardens, vineyards, and stone quarries. In this region is the arsenal of La Carraca. The principal local industries are salt, alcohol, liqueurs, starch, beer, tanneries, esparto grass rugs, soap, hats.

There are many flour-mills, and manufactures of rope, sails, and barrels.

San Francisco, the 9th city in size in the United States and the metropolis of California and of the Pacific coast, is situated in 37° 47′ 22·55″ N. and 122° 25′ 40·76″ W. Important changes in form of government, the coming of additional transcontinental railways, the Oriental outlook, caused by the control of the Philippine Islands by the United States, the increased trade with China, Japan, and the islands of the Pacific, caused a remarkable development during the last years of the 19th century.

Topography.—Within the decade from 1890 to 1900 the Golden Gate, or entrance to the harbour, was fortified in the most approved modern manner. Within the bay several islands are controlled by the Government, and fortified, while at the Government navy yard at Mare Island, north of the city, and at the Union ironworks, on the peninsula, are docks capable of receiving the largest modern warships. Suburban communities have grown up about the city, chief among which are Oakland, Alameda, Berkeley, San Rafael, Sausalito, San Mateo, Menlo Park, and Palo Alto. Electric and steam railways and ferries bring these places into close communication with the city. There are in the city over 140 miles of electric railways, 77 miles of cable roads, 12 miles of the steam system, and 10 miles of horse railways. The steep hills caused the invention here of the cable railway, now used in many cities of the world. Market Street is the artery from which diverge all the principal streets. It is paved with bituminous rock, material used largely for all the streets. The city has 195 miles of paved streets and 305 miles of sewers. In the early days the number of wooden dwellings was considerable, but builders are no longer hampered by the fear of earthquakes. Brick and stone are extensively employed, excellent stone being found in the Sierra and the Coast range, and business buildings of ten and eleven storeys or higher have been erected. Among the notable modern buildings are the United States post office, the Ferry building, Mills building, Spreckels building, hall of justice, hotel St Francis, mutual savings bank, and the Crocker building.

Population.—The population in 1890 was 298,997 and in 1900, 342,782, of whom 116,885 were foreign-born, and 17,404 were coloured, including a large proportion of Chinese; 1654 were negroes. Out of 128,985 adult males, 3596 were illiterate (unable to write), of whom 3354 were foreign-born. The death-rate in 1890 was 22·5, in 1900 it was 20·5.

Education, Libraries, Newspapers.—There are ten daily newspapers. Three morning and two evening papers are in the English language, the others represent the interests of the foreign population and of commerce and trade. There are six first-class theatres. The chief libraries are the Free Public Library of 143,000 volumes, and those of the Mechanics' Institute and the Mercantile Library Association. The private libraries of the late Adolph Sutro and of Hubert Howe Bancroft contain collections of rare books and pamphlets, including volumes relating especially to the history and development of the Pacific coast. The Free Library has six branches in various parts of the city, and circulated in the year ending 30th June 1901, 711,409 books. Chief among the museums are those of the Academy of Sciences, the State Mining Bureau, the State Board of Trade, and the Alaska collection, the last named controlled by the university of California. There is also a nucleus of an excellent museum owned by the city and situated in Golden Gate Park, the result of the California Midwinter Fair, a successful exhibition held there in 1894, following the World's Fair at Chicago. There are 82 public schools, with 1017 teachers, a total enrolment of 48,517 pupils (30th June 1901), with average daily attendance of 34,771. The university of California, a state institution at Berkeley, an hour's ride from San Francisco, and the Leland Stanford, Jr. University, at Palo Alto, south of the city, afford exceptional advantages for advanced education. The university of California has its departments of medicine, law, pharmacy, and dentistry, and the Mark Hopkins Institute of Arts and other minor departments situated in the city. The city has in all 11 medical and dental colleges. There are 145 churches of all denominations, 102 charitable and benefit organizations, and 44 hospitals and asylums.

Manufactures and Commerce.—For the year ending 30th June 1901 the chief manufactures, with the value of the product, were as follows:—Bookbinderies \$800,000, breweries \$4,000,000, coffee and chocolate, \$2,200,000, confectionery \$700,000, cigars \$2,000,000, crackers \$1,750,000, chemicals \$1,500,000, clothing \$1,500,000, electrical \$3,750,000, flour \$3,000,000, fruit-canning \$3,700,000, gas \$4,500,000, glass \$1,300,000, millinery \$810,000, provisions \$3,500,000, shirts \$1,700,000, ships \$3,000,000, shoes \$2,300,000, sugar \$14,211,516, tanneries \$1,310,000, tinware \$1,750,000, wire \$1,500,000, wool-scouring \$2,000,000.

The harbour and its branches are such that deep-water ships may go directly to docks within short distances of their source of supply, saving large cost of loading. The import of tea in 1890 was valued at \$923,025; in 1899 the valuation had risen to \$1,233,857, representing an import of 10,370,630 lb; 1900, 13,417,970 lb. During the year ending 30th June 1901 wheat exports were 13,262,796 bushels, valued at \$8,232,916, and wheat flour exports for the same period were valued at \$3,083,532. The exports of treasure by sea, 1901, were \$4,330,308, and the imports \$28,649,923. The total merchandise exports for 1901 were valued at \$34,596,792, of which \$11,316,448 were wheat and flour. The total imports for 1901 were \$35,161,753.

Railways, Banks, and Finances.—The city is connected with the Eastern states by three through overland railways, the Central Pacific, the Southern Pacific (which controls the Central Pacific), and the Atchison, Topeka and Santa Fé routes. Besides these, it has traffic connexions with the Canadian Pacific, Northern Pacific, and Great Northern transcontinental roads. Lines of the Southern Pacific and its branches connect the whole state with the city, besides the smaller lines of the California North-Western and other roads that penetrate the agricultural, mining, and lumbering districts. On 1st July 1900 the first train of the Santa Fé Railway left San Francisco for the east, a significant event, since there had been practically but one railway corporation (the Southern Pacific Company) controlling transcontinental traffic, with San Francisco as its western terminus, since the first overland road was completed in 1869. The construction of the Santa Fé was the outgrowth of the building of the San Joaquin Valley Railway, to which citizens subscribed \$2,500,000.

There are 38 banks. The total clearings in 1890 were \$851,066,172; in 1895 they were \$692,079,240. In 1899 they were \$955,851,466, an increase of \$143,638,308 over 1898. In 1901, they were \$1,165,301,561. In the nine savings banks of the city there was due to depositors on 11th August 1900, \$120,480,927. The United States mint during 1899 coined \$63,254,886; since the mint was established in 1854 the total coinage has been \$1,206,122,701.

The assessed valuation of real and personal property in 1901 was \$413,388,420, of which the former amounted to \$289,970,519 and the latter to \$123,417,901. Property is assessed at 60 to 80 per cent. of its value. The tax rate is \$1.556 on the hundred dollars. The city's net debt (funded and floating, less sinking fund) was on 30th June 1902 only \$17,185.77.

Administration.—After many years of notorious "Boss" rule the city in 1896 elected a reform mayor. This was the most important movement for good government in the history of the city since the vigilance committee of 1856. It was followed by the adoption (1899) of a new charter, formed by a board of freeholders, and based upon the most approved models of modern municipal government. The city's control is centralized, giving more power to the mayor, who has the appointment and removal of the following commissions—fire, police, school, election, park, civil service, health, and public works. The principle of the "initiative and referendum" was incorporated in the charter, by which a percentage of the voters can compel the submission of measures for public approval. There are 12 departments of the superior court, 5 justices' courts, and 4 police courts. The board of supervisors has 18 members. The board of education has 4 members. There is a paid fire department of 446 members; the police department

has 588 members, with provision for an increase of one officer for each 500 of the population. The board of public works controls the streets, sewers, and public improvements of the city, and is composed of engineers of recognized standing. The water-supply is excellent, being furnished by a private corporation, but the city plans for the ownership of its water and lighting system.

(J. D. P.)

San German, a primitive and decadent inland city near the west end of the south coast of Porto Rico, settled in 1511. It is a picturesque place with narrow streets, churches, and convents, largely constructed in the 16th century. It has several religious retreats and hermitages, which are frequented by the devout. The population in 1899 was 3954.

San Gimignano, a town of the province of Siena, Tuscany, Italy, 24 miles north-west of Siena (16 by rail to Poggibonsi), at an elevation of 1181 feet. Being surrounded by its ancient walls, and retaining thirteen out of its original fifty towers, it is, with its predominantly Gothic architecture, a thoroughly mediæval-looking town. The most noteworthy of the public buildings are the town-hall (1288–1323), with a museum, and paintings by Benozzo Gozzoli, Sodoma, and others; the cathedral, with fine frescoes by Ghirlandajo (1475); the church of S. Agostino, with famous frescoes (1463–65) by Gozzoli; other churches of the 12th and 13th centuries; and a small public library. Population of commune (1881), 8524; (1901), about 9000.

San Giovanni a Teduccio, a town of the province of Naples, Campania, Italy, on the east shore of the Bay of Naples, and at the foot of Mount Vesuvius, 3 miles south-east of Naples by the railway to Salerno. It has railway workshops, iron and zinc works, flour-mills, distilleries, tanneries, and macaroni factories. Iron is mined here. There is a school of design and the mechanical arts. Population (1881), 14,397; (1899), about 18,000.

Sangli, a native state of India, in the Deccan division of Bombay, ranking as one of the Southern Maratha Jagirs. The territory is widely scattered among other native states and British districts. Area, 1083 square miles. Population (1881), 196,832; (1891), 238,945; gross revenue (1897–98), Rs.11,75,800; tribute, Rs.1,35,000; number of police, 782; number of schools, 101, with 7043 pupils. The chief, whose title is Tatya Saheb Patwardhan, is a Brahman by caste. The town of SANGLI is situated in 16° 51′ N. and 74° 36′, E., on the river Kistna, and has a station on the Southern Maratha Railway, 11 miles from Miraj junction. Population (1881), 13,272; (1891), 14,798; municipal income (1897–98), Rs.10,341. There is a high school, and state printing-press, issuing a monthly gazette.

San Jose, a city of California, U.S.A., capital of Santa Clara county. It is situated in 37° 20′ N. and 121° 53 W., in the beautiful Santa Clara valley, which lies between two of the coast ranges. It is 46 miles south-east of San Francisco, and at an altitude of 87 feet. The site is level, with broad streets well shaded with semi-tropical vegetation. It has excellent water-supply and sewerage systems. The city is upon lines of the Southern Pacific Railroad, connecting it with San Francisco, Monterey, and other points. The Santa Clara valley is one of the most fertile and most productive of the fruit regions of California, and the chief business of San Jose is the treatment, handling, and marketing of its fruit crop. Population (1890), 18,060; (1900), 21,500, of whom 4577 were foreign-born and 810 were coloured, including 209 negroes.

San José de Costa Rica, the capital of the republic of Costa Rica, situated in 9° 56′ N. and 84° W. Population (1897), 25,000. Altitude above sea-level, 3868 feet. It is connected with Port Limón by a railway. The city is well laid out and paved, and has many fine buildings and public gardens. It possesses a national theatre, numerous charitable institutions, a museum, public library, and a number of learned societies.

San Juan, the full name of which is San Juan Bautista de Puerto Rico, a city on the northern coast of Porto Rico, on a small and narrow island which is united to the mainland by the bridge of San Antonio. It is the political capital of Porto Rico, and is known throughout the country as "El Capital." The city was founded about 1577 by Governor Juan Ponce de Leon. It is chiefly noteworthy for its fortifications and public buildings. A strong mediæval wall faces the land, and steep fortified cliffs overlook the sea. The fine strongholds include the Morro at the entrance of the harbour, Forts Santa Elena and San German, and the citadel of San Cristobal, which overshadows the city and commands the sea front. There are many large and handsome public edifices, including all the island administration buildings, the captain-general's palace, the casa de ayuntamiento municipal (city hall), the barracks of Ballaja, the artillery barracks, and the casa blanca, which is said to have been built by Ponce de Leon. As building space is scarce, the houses are all two or three storeys high. The streets and public plazas are neatly paved. The harbour is capacious and landlocked, except on the north. A highway running across the island from north to south connects San Juan with Ponce. The city is purely a political and social capital, and not a distributing or commercial centre, except for a small surrounding local area. Population (1899), 32,048.

San Lucar de Barrameda, a town of the province of Cadiz, Spain, near the mouth of the Guadalquivir, on the railway from Bonanza to Jerez. The town has an active trade in wines and agricultural products. Population (1887), 22,667; (1897), 23,377. The town is divided into two parts, Alta and Baja, the former being the older and crowned with the ruins of a strong castle. Besides the old parish church, there are the palace of the dukes of Medina Sidonia and several convents, and in both church and palace there are interesting pictures and works of art. There are good schools, chiefly directed by religious Orders. In 1898, 232 English steamers, of 194,854 tons, entered Bonanza, the port of San Lucar. The chief imports were coal from England, sulphur and dry vegetables from France; the exports, salt, oats, wine, and fruit.

San Luis, a city in Brazil, and capital of the state of Maranhão. It is well built, and has fine public buildings and gardens, an episcopal palace, and thirteen churches. Population, 38,000.

San Luis, interior town of Santiago province, Cuba, about 25 miles from Santiago. It is the terminus of the railway leading from that city across the Sierra Maestro to the thickly populated district of Cauto valley. The population in 1899 was 5059.

San Luis Potosí, a state of Mexico, bounded on the N. by the state of Coahuila; on the S. by those of Hidalgo, Queretaro, and Guanajuato; on the E. by Vera Cruz, Tamaulipas, and Nuevo Leon; on the W. by Zacatecas. Area, 25,323 square miles. Population (1879), 516,486; (1895), 568,449. The state is noted for the salubrity of its climate, being high and dry on the table-lands, and is rich in agricultural and mineral resources. The Mexican National Railway traverses the state from

north to south, and the Mexican Central Railway from east to west. The internal commerce is very extensive. It is one of the most progressive states of the Mexican Republic, and agriculture and mining are in a flourishing condition. Stock-raising is also extensively carried on. The principal agricultural products are cereals, sugar-cane, coffee, oranges, and tropical fruits. The value of the agricultural produce of this state in 1897 was $3,834,541. Some of the richest silver mines in the republic are found in the mining district of Catorce. The value of the mineral products in 1897 was $3,105,941. The state is divided into thirteen districts or partidos. San Luis Potosí, the capital, population in 1895, 69,050, is one of the most important cities of the republic. It is at an altitude of 1810 metres above sea-level, and is noted for its fine public buildings and churches. It is also one of the smelting centres, large quantities of argentiferous lead and gold-bearing ores being sent there for reduction. The chief towns in the state are Matehuala (13,101), Catorce (9547), Rio Verde (6628), Santa María del Rio (6589), Cedral (6333), Venado (5750), Soledad Diez Gutierrez (5730).

San Marino, the smallest republic in the world—its boundary-line measures about 18½ miles. It lies about the three peaks, together known as Monte Titano, which terminate the Apennines towards Rimini. It is enclosed on all sides by Italian territory, but maintains complete independence, and treats with Italy as one sovereign Power with another. During the twenty-five years 1874–99 the population increased from 7816 to 11,000, or more than 40 per cent., and San Marino is now relatively the most thickly populated country in Europe, having in 1899, on an average, 443 inhabitants to the square mile. It is divided into eight parishes: Pieve (in which stands the Città or town), Serravalle, Montegiardino, Faetano, Fiorentino, Chiesanuova, Domagnano, and Aquaviva.

Though the government is now conducted by a council of sixty, it was originally purely democratic, public business being transacted by the "fathers of families" at a mass meeting known as the "Arengo." This mass meeting is still held twice a year, when the retiring captains-regent (two in number) give place to those newly elected. The captains-regent have no executive power; they are merely the representatives of the council. The meetings of the latter are held whenever necessary. Its debates are carried on with closed doors in the main hall of the Government palace, which was restored in 1894, and is a fine specimen of mediæval architecture. Justice is administered by a legal commissary who resides in the republic, and must be an Italian. Three years is the term of office, and it may be renewed. Like the captains-regent, the commissary is answerable to the great council. Two judges, one of appeal, reside in the kingdom of Italy, and send their judicial sentences to be read before the council. Capital punishment was abolished within the republic in 1848, and in 1865 a penal code was promulgated. The civil legislation is mainly contained in the ancient statutes, but there are a few additional laws: a bill relating to mortgages (1854), a short modern code concerning bills of exchange, and some fiscal laws dealing with stamp duties, &c. Taxation is so slight as to be practically non-existent, the two most important taxes being those of 1 per cent. (about) on country property and ⅘ per cent. on town property. The revenue ranges from 350,000 lire to 450,000 lire (£14,000 to £18,000). There is no public debt, but for the last few years of the 19th century the Budgets showed a deficit. It has been proposed to levy fresh taxes, but the council has refused to vote them. San Marino possesses an army of 900 men and 60 officers, but the military spirit is lacking among the people, and it is only on high days and holidays that the troops, with their excellent military band, are called on for service. Attendant on the council is the Guardia Nobile, with picturesque uniform. The carabineers must be foreigners. Trade is carried on by means of large fairs, there being no railway nearer than Rimini. Among the exports are oxen, corn, wine, and building-stone, while the imports include all the manufactured goods used by the inhabitants. Building-stone, which is the almost only source of mineral wealth possessed by San Marino, is extracted around the Città, or town, the central point about which is gathered the historical interest of the republic. Small deposits of chalk, sulphur, and iron are found in various places, and Valle Sant' Anastasio is known for its mineral waters. San Marino has a coinage of its own, but Italian money is used by preference. It has hitherto retained its own intricate system of weights and measures, and issues a complete set of stamps. Public charity is widely distributed, and there is an excellent hospital and refuge, the operating-room in which has been lately furnished with modern appliances. Three doctors and a qualified surgeon, all foreigners, are maintained at the expense of the State.

The Italo-Sanmarinese Treaty, renewed in 1896, is on the same basis as before the renewal. Thereby either State recognizes the validity of contracts by deed signed in the other, and promises to grant extradition for criminal (not political) offences, provided that the criminal be not a citizen of the State in which he shall have taken refuge, nor have been domiciled there for a space of ten years. In 1899 San Marino concluded a similar extradition treaty with England. The republic exercises its right of representation by consuls and chargés d'affaires, having representatives in London, Paris, Vienna, Budapest, and several Italian cities (Rome, Naples, &c.).

San Miguel, a city of Central America, in the republic of Salvador, about three-quarters of a mile from the right bank of the Rio Grande and 107 miles east of the capital, at an altitude of 360 feet above sea-level. It is the 3rd city in importance as to population, having about 25,000 inhabitants, and is a handsome town, with fine buildings and streets, and transacts considerable foreign trade. It is not deemed healthy, being exposed to malarial exhalations arising from the swamps to the south-east.

San Miguel de Mayumo, a town in the northern part of the province of Bulacan, Luzon, Philippine Islands. It has a cool and very healthy climate, commands a beautiful view of the surrounding country, and was one of the finest provincial towns in the Philippines until its principal buildings were destroyed in a fire started by a band of thieves in 1901. Near the town are quarries of limestone, and the agricultural lands in its vicinity produce rice, sugar-cane, Indian corn, and cotton in abundance. Cotton fabrics are woven in considerable quantity by the women; and there are a few good cabinet workers, who utilize the beautiful hard woods of the neighbouring forests in their work. The principal language is Tagalog. Population, 20,000.

San Miniato, a town and episcopal see of the province of Florence, Tuscany, Italy, 21 miles west by south of Florence by the railway to Pisa. Its cathedral dates from the 10th century. It manufactures glass, olive oil, leather, and hats. It is notable as the cradle of the Bonaparte family. Population (1881), 7271; (1899), about 8000.

San Pablo, a town in the southern part of the province of Laguna, Luzon, Philippine Islands. Its people engage in agriculture—rice, abacá, and copra being the principal crops raised. The language is Tagalog. Population, 19,000.

San Remo, a famous seaside resort of the province of Porto Maurizio, Liguria, Italy, on the coast of the west Riviera, 84 miles by rail south-west of Genoa and 32 east-north-east of Nice. It has come into increased repute since the stay there in 1887–88 of the German Emperor Frederick III. In 1898–99 the visitors numbered 21,850. A new casino was opened in 1888. There is a meteoro-

logical observatory. Flowers, especially roses and carnations, are extensively grown for export. Olives, lemons, and palms are also reared. The port is shallow, despite dredging in 1896–97, and exposed to east winds. Population (1881), 14,002; (official estimate, 1897), 19,636.

San Roque, a town of the province of Cadiz, Spain, near the northern shore of the bay of Algeciras, with a station on the railway to that place. The country around San Roque is hilly and watered by the river Guadarrunque and the Guadiaro to the north. The neighbourhood produces wheat, wine, fruit, olives, oranges, cork, and the local industries are alcohol, liqueurs, starch, flour, tanneries. The town looks clean and modern. Its streets are steep, and from the heights there is a splendid view of the bay and straits. The fortifications were razed after the War of Independence against Napoleon I. Population (1887), 8792; (1897), 7809.

San Salvador, a city in Central America and the capital of the republic of Salvador, in the valley of Las Hamacas, on the river Acelhuate, in 13° 45′ N. and 80° 8′ W., at an altitude of 2115 feet above sea-level. Population (1892), 30,000. It was founded by Jorge de Alvarado in 1528 at a spot a short distance from the present site, to which it was transferred in 1539. From 1834 to 1839 it was the capital of the republic. Then for a year the chief town was San Vicente. Since 1840 it has remained the capital. Besides all the offices of government, the city has a university, an academy of science and belles-lettres, a national library, an astronomical observatory, a museum, botanical garden, a national institute, polytechnic school, the Rosales hospital, an asylum and poorhouse, orphanage, &c. Considerable commerce and manufactures are carried on. The city has in the past often suffered from earthquakes; but a style of building has been adopted with a view to preventing serious damage to the structures. The railway connecting the capital with the port of Acajutala on the Pacific was opened to traffic on 19th March 1900.

San Salvador Island. See BAHAMAS.

San Sebastian, capital of the province of Guipuzcoa, Spain, the summer residence of the court since 1886. The influx of visitors, attracted by the presence of the court, and by the prolonged local festivities, the bull-fights, the handsome casino and gambling-rooms, increases the permanent population by about twelve thousand to fifteen thousand. Fixed population, 21,355 in 1877; 35,975 in 1897. Until very modern times, San Sebastian was a walled and fortified town. On the hill still stand the castle of La Mota and the batteries and redoubts of both slopes of Monte Urgull. The bull-ring, in Moorish style, will hold 10,000. The new town of San Sebastian begins at the Alameda boulevard on the site of the old fortifications, and occupies the greater part of the peninsula that lies between the river Urumea and the Bay of La Concha. In the new town a fine church and markets have been built since 1895, and a Jesuit college and chapel. On the opposite side of Concha Bay, on the brow of a hill, stands the Queen's summer palace of Miramar in well laid-out grounds. The palace is not remarkable for its architecture, being a châlet-like irregular building, which, however, cost more than £85,000. In few Spanish towns has more been done to improve public education and with better results than in San Sebastian. The industries of the town have developed, and there are many breweries, saw and flour mills, manufactures of preserves, soap, candles, glass, paper, especially in the busy suburb that has sprung up on the right bank of the Urumea, connected with San Sebastian by a fine stone bridge and a wooden bridge. The fisheries are important.

Santa Ana, a city of Salvador and capital of the department of the same name, about 50 miles north-east of the city of San Salvador, and at an elevation of 2093 feet above sea-level. It is a finely built city, the largest in Salvador, its population being about 33,000. Santa Ana has a number of fine public buildings, the municipal palace, barracks, hospital, public market, being the most noteworthy. The city is well supplied with water, and has wide and well-paved streets. It was connected in 1899 by a telegraph line with the capital, and the railway between the two cities was opened to traffic on 19th March 1900. An institute has also been founded.

Santa Ana, a city of California, U.S.A., capital of Orange county. It is in the southern part of the state, 33 miles south-east of Los Angeles, on the Southern California and the Southern Pacific railways, at an altitude of 135 feet. It is in the orange, lemon, and wine region of southern California, and its industries are connected with the handling and transportation of these products. Population (1890), 3628; (1900), 4933, of whom 506 were foreign-born.

Santa Barbara, a city of California, U.S.A., capital of Santa Barbara county. It is on the coast, in the southern part of the state, at the southern foot of the Santa Inez Mountains, and is reached by a branch of the Southern Pacific Railroad. On account of its mild and equable climate, it has become a well-known winter resort. The Spanish mission, founded in 1786, is near the city, and is still well preserved. Population (1890), 5864; (1900), 6587, of whom 1143 were foreign-born and 269 coloured.

Santa Catharina, an Atlantic state of Brazil, between 26° 30′ and 29° 18′ S. and 48° 18′ and 54° 12′ W. Area, 27,434 square miles. Population in 1890, 283,770; in 1900, estimated at 320,000. It is bounded on the N. by Paraná, on the W. by the Argentine republic, on the S. by Rio Grande do Sul, and on the E. by the Atlantic. Coal, iron, silver, gold, and petroleum are found in the state, but very little is extracted. The capital, Desterro, officially called Florianopolis, has a population of about 25,000. Its trade is effected through the port of São Francisco. Amongst other towns are Lages, Laguna, São Francisco, San José, and Tubarao.

Santa Clara, the capital of Santa Clara province, Cuba, an old town in the interior, founded in 1689. It is surrounded by fertile plains cultivated in cane, which are interspersed with many picturesque hills, and is the eastern terminus of the railway system from Havana. Population (1899), 13,763.

Santa Cruz, a city of California, U.S.A., capital of Santa Cruz county. It is on the north side of Monterey Bay, and on a branch of the Southern Pacific Railroad, 75 miles south of San Francisco. It is a popular seaside resort. The city has asphalt pavements, water-works, a sewerage system, and several large hotels. It is built on the site of the old Santa Cruz mission, founded in 1791. Population (1890), 5596; (1900), 5659, of whom 1123 were foreign-born, and 189 were coloured.

Santa Fé, a province in the centre of the Argentine republic, bounded on the N. by the territory of Chaco, on the S. by Buenos Aires, on the E. by Entre Rios and Corrientes, and on the W. by Cordoba and Santiago del Estero. Official area at the census of 1895, 50,916 square miles. Population (1869), 89,117; (1895), 397,188, or an increase of 3457 per thousand. The

province is divided into 18 departments. In 1895 there were 19,809 farms, 3,688,118 acres planted in cereals, 2,315,007 head of cattle, 422,101 horses, 1,988,777 sheep. Santa Fé, the capital, stands near the junction of the Salada with the Paraná, 299 miles north-west of Buenos Aires by rail. The town has quite a modern appearance, and the population (24,755) has more than doubled. There is a normal school for teachers. Three tramways run through the city. The building of small trading vessels is one of the chief industries.

Santa Fé, a city of New Mexico, U.S.A., capital of Santa Fé county and of the Territory. It is situated in 35° 42′ N. and 105° 57′ W., on a plain at the west base of the Sangre de Cristo range, north of the centre of the Territory, at an altitude of 6954 feet. The site is nearly level, with a gentle slope to the west, but the town is very irregular in plan, having been laid out centuries ago by the Spaniards, and having undergone little change since it came within the United States. It is the meeting-point of a branch of the Atchison, Topeka, and Santa Fé and of the Denver and Rio Grande railways, but being off the direct line of travel and traffic, it has made no progress. Population (1890), 6185; (1900), 5603, of whom 256 were foreign-born.

Santa Maria, a town of the province of Caserta, Campania, Italy, 4 miles west of Caserta, occupying the site of the ancient Capua. It has a cathedral (restored) and a technical school. Glass, bricks, ropes, and leather are manufactured. Population (1881), 17,896; (1900), about 20,000.

Santa Maura. See Greece (Ionian Islands).

Santander, a province on the north coast of Spain. Area, 2113 square miles. Population in 1887, 244,274, and 263,673 in 1897. The average of births is 3·63 per cent., that of deaths 3·02, and the proportion of illegitimate births 4·60 per cent. The province is traversed by several railways, and possesses besides many good state, provincial, and municipal roads, and several narrow-gauge mining railways. The industries, up to the eve of the loss of the islands of Cuba and Puerto Rico in the Spanish-American war in 1898, had steadily increased, except the glass and crystal factories, which decayed rapidly from 1886. Beer is brewed in large quantity. Salt and tinned fish are extensively prepared for export. The export and coasting trade is chiefly carried on through the ports of Santander, Suances, Santoña, and Castro Urdiales. A hardy race of seamen mans the fishing fleet at these four ports and many small places along the coast, and there are numerous industries connected with the fisheries. The people have shown considerable energy in agriculture, sylviculture, and mining, but have been greatly assisted by foreign capital and enterprise.

In 1897 wheat was grown on 11,272 acres, rye, barley, oats, maize, on 42,957, pod fruit on 4500, vine on 3000. Live stock is both abundant and valuable, especially in the highlands of Santander. In 1897 there were 516,089 head registered, including 5377 horses, 1092 mules, 2228 asses, 193,392 cattle, 178,549 sheep, 65,937 goats, 69,514 pigs. The mining interests are important, and were much developed in the last decade of the 19th century. Thirty-five zinc, 1 graphite, 31 iron, 1 lignite, and 1 salt mines are worked. These mines give employment to 4773 hands, and the output in 1898 was 34,416 tons of zinc, 756,165 tons of iron-ore, 352 tons of lignite, 356 tons of lead (from the zinc mines), and 130 tons of salt. The production of calamine was 33,484 tons, valued at £46,034, chiefly at Reocin; and the Castro Urdiales mines alone produced 188,840 tons of iron-ore.

Santander, capital of the above province and one of the most important ports of the peninsula. It is the terminus of the railway from Madrid and Palencia, and of the Bilbao–Santander coast line and several provincial and mining lines. Population, 42,725 in 1887; 50,640 in 1897. The industries, the trade and fisheries of Santander are prosperous and important. The primary schools, schools for training teachers, the institute, the nautical school, are numerously attended. There is a tobacco factory, where 1800 women are employed. Among the modern improvements of the town are its town-hall, theatre, markets, barracks, bull-ring, clubs, civil and military governors' residences, custom house, hospitals. Many of the houses on the bay front and public buildings have been restored since the catastrophe of 3rd November 1893, when the steamer *Cabo Machichaco*, laden with 1700 cases of dynamite, blew up near the quay. The port of Santander is very important. The dredging of the harbour is satisfactory, and the water in the channel right up to the quays is deep enough to allow heavy-draught vessels to come alongside at almost any state of the tide. In 1898, 222 British vessels entered with cargoes valued at £264,425, and 222 cleared with cargoes valued at £173,682. The vessels of other countries that entered were: 80 French, 39 Swedish and Norwegian, 3 Dutch, and 1176 Spanish, the majority of the last being coasters. The iron-ore trade is steadily increasing, the exports having been 332,974 tons in 1897 and 406,996 tons in 1898, of which 265,549 tons went to the United Kingdom.

Santarem, a city of Portugal, capital of the district Santarem, crowning a height above the right bank of the Tagus, 44 miles north-east of Lisbon. Between the foot of the hill and the river is the suburban port of Ribeira de Santarem, where the Tagus is crossed by a fine bridge. The town is still surrounded by walls, pierced by eight gates. Population (1900), 8704.

The district of Santarem has an area of 2649 square miles. Population (1890), 254,844; (1900), 283,676, or 107 to the square mile. It consists in great part of the fertile valley of the Tagus.

Santa Rosa, a city of California, U.S.A., capital of Sonoma county. It is 51 miles north of San Francisco, on the California North-Western and the Southern Pacific railways, among the Coast ranges, at an altitude of 181 feet. The city is regularly laid out on a level site, and has broad well-shaded streets, and an excellent water-supply. Situated in a region admirably adapted for fruit and grain, its industries in great measure consist in the handling of these products. It has flour-mills and fruit canning and drying works. It is the site of Pacific Methodist College, opened in 1861. This had in 1899 a faculty of 7 teachers and was attended by 42 students. Population (1890), 5220; (1900), 6673, of whom 1029 were foreign-born and 140 were coloured.

Santiago, capital of Chile, and also of the province and department of the same name, in 33° 26′ 26″ S. and 70° 38′ 15″ W.; mean altitude above sea-level, 1600 feet. Population (1895), 256,413; (1900), 269,886. The mean summer temperature is 67° F., the mean winter temperature 47°, that for the whole year 57°. The maximum recorded yearly rainfall is given as 25½ inches, the minimum 4 inches. The city is divided into 10 circumscriptions, and 3 municipalities, which form the *municipilidad*. Besides the Government buildings, the city has 17 charitable institutions, in which are included a lying-in hospital, an orphan asylum, lunatic asylum, poorhouse, &c. Among its educational establishments mention should be made of the university, the medical school, the national institute, the military school, the agricultural school, conservatory of music, schools of

painting and sculpture, of mining, normal schools for both sexes, deaf and dumb schools, and professional schools for girls. It has also an astronomical observatory, and a museum of natural history, a zoological garden, and a national library. Eight large daily papers are published, which have a circulation of over 50,000 copies, and about 26 literary, artistic, economic, scientific, and other periodicals. There are some 10 literary, scientific, and other societies in the city, and 9 clubs. Since 1892 Santiago has a superior council of public hygiene, and an institute of hygiene, with bacteriological laboratory, a museum, &c.

Santiago, or SANTIAGO DE COMPOSTELA, a town of Spain, province of Corunna, on the Sar, with a station on the Carril Railway. Population, 16,223 in 1887, and in 1897, 24,335. In the neighbourhood are pastures and fertile valleys that produce much corn, hemp, maize, and fruit. The local industries are distilleries, breweries, soap, chocolate, matches, crystal, linen, and paper. Santiago is still the seat of a university. There are also a veterinary school, an institute founded in 1501, a high normal school, excellent primary schools for both sexes, and a seminary. The library of the university contains 60,000 volumes and several hundred MSS., many valuable and one dating from 788 A.D. The town has several hospitals and refuges, which are open to the pilgrims, still numerous, who flock to the shrine of the patron saint of Spain.

Santiago de Cuba, the capital of the province of Santiago, Cuba, situated at the north-eastern end of a capacious harbour indenting the straight south coast of the eastern end of Cuba. It is second only to Havana in population, and equals it in strategic and political importance. It was founded in 1514 by Lieutenant-Governor Diego Valasquez, and it was made the capital of Cuba in the place of Baracoa a few years later. It continued to be the capital during the first century of Spanish occupation, and from it were fitted out most of the expeditions, including that of Cortez, which explored Spanish North America. The city is very antique and dilapidated in appearance, and is surrounded by a barren, mountainous country. Extensive iron and manganese mines in the vicinity give material support to the population. Much trade from the interior flows into the city through a gap in the mountains to the northward, through which extends a short railway. Extensive commerce is maintained with the remainder of Cuba by coasting vessels, and there are steamer connexions with New York and Europe. The harbour is completely landlocked and easily defensible, entrance being gained through a passage hardly wide enough for vessels to pass, which opens out into a bay sufficient in area to float the navies of the world. It is noted for many historical events connected with the early settlement of Cuba, and the various insurrections. On 3rd July 1898, during the Spanish–American war, the Spanish fleet issued from this harbour and, in the attempt to escape, was destroyed by the blockading American squadron. The surrender of the town to the American army took place a fortnight later. Population (1899), 43,090.

Santiago de Las Vegas, an interior town of Havana province, Cuba. Population (1899), 7151.

Santipur, a town of British India, in the Nadia district of Bengal, situated on the left bank of the Hooghly, with a railway station, 55 miles north of Calcutta. It is a site of an old commercial factory, and still a centre of the weaving trade. There is a municipal high school. Population (1881), 29,687; (1891), 30,437.

Santley, Charles, (1834– ——), English vocalist, son of an organist at Liverpool, was born 28th February 1834. He was given a thorough musical education, and having determined to adopt the career of a singer he went in 1855 to Milan and studied under Gaetano Nava. He had a fine baritone voice, and while in Italy he began singing small parts in opera. In 1857 he returned to London, and on 16th November made his first appearance in the part of Adam in *The Creation* at St Martin's Hall. In 1858, after appearing in January in *The Creation*, he sang the title-part in *Elijah* in March, both at Exeter Hall; and his future was now assured. In 1859 he sang at Covent Garden as Hoel in the opera *Dinorah*, and in 1862 he successfully appeared in Italian opera in *Il Trovatore.* He was then engaged by Mapleson for Her Majesty's, and his regular connexion with the English operatic stage only ceased in 1870, when he sang as Vanderdecken in *The Flying Dutchman.* His last appearance in opera was in the same part, with the Carl Rosa Company at the Lyceum Theatre in 1876. Meanwhile, in 1861 he sang *Elijah* at the Birmingham Festival, and in 1862 was engaged for the Handel Festival at the Crystal Palace. From that time he was recognized as the first of English baritones, the wonderful conviction which he threw into his singing and his dramatic fire and religious fervour being specially noteworthy. At the musical festivals and on the concert stage his success was immense. In such songs as "To Anthea," "Simon the Cellarer," or "Maid of Athens," he was unapproachable, and his oratorio singing carried on the finest traditions of his art. In 1858 Santley married Gertrude Kemble, and their daughter, Edith Santley, had a great success as a concert singer.

Santos, a city and port of southern Brazil, in the state of São Paulo, 34 miles from the capital of São Paulo by rail. Population (1900), 41,000. It is the principal port of shipment of Brazilian coffee, the total export for 1899 being 364,928,493 kilogrammes, valued at about £8,275,000. In 1900, 5,849,114 bags of 60 kilogrammes each (valued at about £9,000,000) were exported; and in 1896, 4,157,971 bags. In 1900, 699 ships, of 869,718 tons, entered and about the same number cleared at the port of Santos.

Santo Domingo. See HAYTI.

Saône, Haute-, a department of eastern France, resting on the southern end of the Vosges.

Area, 2075 square miles. The population, 280,856 in 1891, had decreased to 265,179 in 1901. The births in 1899 were 5773, of which 494 were illegitimate; deaths, 5809; marriages, 2038. There were in 1896 1061 schools, with 44,000 pupils, 1 per cent. of the population being illiterate. The land under cultivation in 1896 was 1,210,300 acres; 577,980 acres being plough-land and 19,760 acres vineyards. The department in 1899 grew wheat to the value of £692,000; rye, £80,000; oats, £440,000; potatoes, £380,000. The vintage of 1899 was valued at £108,000. The live stock (1899) included 22,730 horses, 155,800 cattle, 71,540 sheep, and 65,480 pigs. Mining in 1898 produced 217,000 metric tons of coal, 9000 tons of lignite, 1760 tons of iron, and 6872 tons of rock-salt. The industry in metals yielded 1209 tons of cast-iron, 188 tons of iron, and 1280 tons of steel. There are also extensive industries in textiles, glass, and distillation. Vesoul, the capital, had in 1901, 9704 inhabitants.

Saône-et-Loire, a department in east central France, traversed by the mountains of Morvan and Charolais, and watered by the Saône and the Loire.

Area, 3331 square miles. The population, 619,523 in 1891, numbered 616,389 in 1901. The births in 1899 were 14,099, of which 655 were illegitimate; deaths, 12,072; marriages, 5005. The schools, primary grade, numbered (1896) 1339, with 104,000 pupils, 2 per cent. of the population being illiterate. Out of 1,962,415 acres of land cultivated in 1896, 1,034,930 acres were arable, and 61,750 were in vines, a wide area of the department being in pasture. A

wheat-growing country, Saône-et-Loire produced in 1899 wheat valued at £1,470,000; rye, £96,000; oats, £205,000; maize, £232,000; mangold-wurzel, £108,000; potatoes, in which this department ranks prominently, £846,000. Its vintage in 1899 was valued at £883,000; its crop of colza, £32,000; its rape, £8800; beetroot, £11,200. While its agricultural value is very considerable, the department is not less noted for its live stock, which in 1899 included 25,830 horses, 352,930 cattle, 126,770 sheep, 223,710 pigs, and 33,190 goats. The mineral basin of the Saône and Loire (Autun, Creuzot) is one of the most important in France, and produced in 1898 2,096,000 metric tons of coal, 125,000 tons of iron, 9000 tons of manganese and other metals, and 142,000 tons of various substances. Creuzot is the chief centre in France of the metallurgical industry, and turned out in 1898 105,000 metric tons of cast-iron, 47,000 tons of iron, and 112,300 tons of steel, of the value of £2,500,000, the workmen employed numbering over 11,000. There are important glass manufactures in the arrondissement of Autun. Distillation produced 44,000 gallons of alcohol. Macon, the capital, had in 1901, 18,928 inhabitants; Châlon-sur-Saône, 29,058; and Creuzot, 30,175.

São Paulo, an Atlantic state of Brazil, between 19° 54′ and 25° 15′ S. and 44° 6′ and 53° 28′ W.; coast line 373 miles. It is bounded on the N. by Minas Geraes, Goyaz, and Matto Grosso; on the W. and N. by Goyaz; on the S. by Paraná; and on the E. by Rio de Janeiro and the Atlantic. Area, 112,330 square miles. Population (1890), 1,384,753. There is a large and constant immigration from Europe, and it is estimated that in 1898 there were about 500,000 Italians in the state. The capital, São Paulo, has a population of about 270,000; other towns, Santos (41,000), Sorocabo (14,000), Parahybuna (11,000), Piracicaba (11,000), Itú (11,000), Iguape (10,000), Botucato (7000), Caconde, Braganza and Cacapava, Franca and São Sebastião, each with about 5000. There are over 100 towns in the state. In 1900 there were in operation over 2000 miles of railway. It is the greatest coffee-producing region in the world, and manufactures cottons and flour.

São Thomé, or St Thomas, an island in the Gulf of Guinea, lying immediately north of the equator and belonging to Portugal. Along with the neighbouring island of Principe (Prince's Island), it forms the province of St Thomas (in Portuguese *São Thomé*). During the dry season (June to September) the temperature ranges in the lower parts between 66·2° and 80·6° F., and in the higher parts between 57·2° and 68°; in the rainy season it ranges between 69·8° and 89·6° in the lower parts, and between 64·4° and 80·6° in the higher parts. On Coffee Mount (2265 feet) the mean of ten years was 68·9°, the maximum 90·5°, and the minimum 47·3°. Area, 318 square miles. Population (1895), 22,000. The natural products of the island embrace oranges, lemons, figs, mangoes, and in the lower-lying districts the vine, pineapple, guava, and banana; and the principal cultivated products are cocoa, coffee, and cinchona. Vanilla, india-rubber, balsam, cinnamon, camphor, cocoa, and kola-nut are also produced. The total trade of the province increased in value from £318,000 in 1888 to £933,900 in 1898; £564,250 being for exports, namely, £234,000 for cocoa, £131,350 for coffee. In 1900 the imports from Portugal were valued at £692,000, and the exports to the same country at £186,310. But the export of cocoa alone to all countries amounted to £587,100 in 1900, and 2405 tons of coffee in all were sent out of the island. The imports coming next in value are cocoa-nut, cinchona, arrowroot, palm oil, bamboo, balsam, kola-nuts, manioc flour, fruit, timber, pepper, and oil-seeds. Cocoa is the principal product of Principe. The total trade in 1899 was valued at £1,188,888.

Sapporo.—The official capital of the island of Yezo, Japan, situated in 43° 04′ N. and 141° 21′ E. It has a population of 37,482. It was chosen in 1870, and owed its prosperity at the outset chiefly to the public institutions established there by the Japanese Government in connexion with the colonization bureau, which had for its object the development of Yezo's resources. It is now a garrison town, being the headquarters of the 7th division. It has an agricultural college, a museum, saw-mills, flour-mills, a brewery, and hemp and flax factories.

Saracco, Giuseppe (1821-——), Italian politician and financier, and knight of the Annunziata, was born at Bistagno on 9th October 1821, and, after qualifying as an advocate, entered the subalpine Parliament in 1849. A supporter of Cavour until the latter's death, he afterwards joined the party of Rattazzi, and became secretary-general of public works in the Rattazzi Cabinet of 1862. In 1864 he was appointed, by Sella, secretary-general of finance, and after being created senator in 1865, acquired considerable fame as a financial authority. In 1879 he succeeded in postponing the total abolition of the grist tax, and was throughout a fierce opponent of Magliani's loose financial administration. Selected by Depretis as minister of public works in 1887, and again by Crispi for the same office in 1893, he contrived, by careful management, to mitigate the worst consequences of Depretis's corruptly extravagant policy, and introduced a sounder system of government participation in public works. In November 1898 he was elected president of the senate, and in June 1900 succeeded in forming a "Cabinet of pacification" after the Obstructionist crisis which had caused the downfall of General Pelloux. His term of office was clouded by the assassination of King Humbert (29th July 1900), and his administration was brought to an end in February 1901 by a vote of the Chamber condemnatory of his ambiguous attitude towards a great dock strike at Genoa. After his fall he resumed his functions as president of the senate. He received the supreme honour of the knighthood of the Annunziata from King Humbert in 1898.

Sáran, a district of British India, in the Patna division of Bengal. Area, 2653 square miles. Population (1881), 2,297,666; (1891), 2,467,477. The average density, 930 per square mile, is the highest rate for all India. Classified by religion, in 1891 Hindus numbered 2,174,734; Mahommedans, 290,980; Christians, 278, of whom 178 were Europeans; "others," 1485. In 1901 the population was 2,361,079, showing a decrease of 4 per cent., compared with an increase of 7 per cent. in the previous decade. The land revenue and rates in 1897–98 were Rs.15,89,076; number of police, 565; boys at school (1896–97), 21,800, being 12·8 per cent. of the male population of school-going age, compared with 28 per cent. for the province generally; registered death-rate (1897), 31·55 per thousand. The principal industry is indigo. There are altogether 42 factories and out-works, with an English capital of £150,000, employing 21,000 persons, and producing 4000 maunds, valued at Rs.7,00,000. Opium also is largely cultivated. Sáran is exposed to the two calamities of drought and flood. It suffered from the famine of 1874, and again in 1896–99. An irrigation scheme from the river Gandak, started in 1878, proved a failure, after a capital expenditure of Rs.7,00,000. The Bengal North-Western Railway runs through the south of the district. The administrative headquarters are at Chapra.

Saransk, a district town of Russia, in the government and 88 miles north of the town of Penza, on the railway from Moscow to Kazañ. Its chief factories are steam flour-mills, oil-mills, tobacco and rope-works, and tanneries. A brisk trade is carried on in corn and hemp,

tallow, spirits, leather, and hemp-seed oil. The town was founded early in the 17th century, when it was a small fort erected against the invasions of the Bashkirs. In 1897 it had a population of 13,743.

Sarapul, a district town of Russia, in the government and 388 miles south-east of the town of Vyatka, on the right bank of the river Kama. This town, the population of which numbered 21,395 in 1897, is an important centre for the manufacture of boots, shoes, and gloves; no less than 450,000 pairs of boots are made per annum and mostly exported to Siberia, the Caucasus, and Turkestan. It has also many tanneries, flax mills, distilleries, iron-works, and rope-works, and is at the same time an important port; more than 1000 boats clear every year, and the movement of the port is 57,500 tons imported, and 32,500 tons, chiefly corn and timber, exported. There are gymnasia for boys and girls, a lace-making school, a municipal library, and a hospital maintained by the local government.

Saratoff, a government of south-east Russia, on the right bank of the Lower Volga, with an area of 32,624 square miles, and a domiciled population which numbered 2,113,077 in 1882 and 2,419,884 in 1897. The density in the different districts in 1897 varied from 55 to 107 inhabitants per square mile, and the urban population amounted to 319,918; the female population numbered 1,230,957. There are a few Germans, but nearly all the inhabitants are Russians; 83 per cent. belong to the Orthodox Church, 5 per cent. are Nonconformists, 6 per cent. Lutherans, and 2 per cent. Catholics. The government is divided into ten districts, the chief towns of which are Saratoff (see below), Atkarsk (9750), Balashoff (12,166), Kamyshin (15,934), Khvalynsk (15,455), Kuznetsk (20,555), Petrovsk (13,212), Serdobsk (12,721), Tsaritsyn (55,967), and Volsk (27,039). Education makes some progress; the number of young men taken into the military service in 1897 who could read was 40 per cent. of the total number taken, as against 21 per cent. in 1874. The proportion of women, however, who know how to read and write continues to remain very small. In 1898 primary schools were attended by 56,180 boys and 22,870 girls. Of the total area (19,956,000 acres), 52 per cent. belonged to the peasants in 1896, 38 per cent. to private landowners, 5 per cent. to the Crown, and 5 per cent. to the Imperial family and the municipal authorities. These figures, however, are rapidly altering, as the peasants constantly buy considerable quantities of land. No less than 58 per cent. of the total area, that is, 11,510,000 acres, is under fields, 19 per cent. under meadows and pasture, and 13 per cent. (490,000 acres) under woods, while 10 per cent. is unavailable for culture. Green crops are now being cultivated more widely, both on the private estates and among the peasants. Agriculture suffers, however, very much from droughts, and the attacks of marmots, mice, and insects, and consequently the yield varies from 3,200,000 cwt. to 11,550,000 cwt. in different years. The average yield in 1895–99 was 6,524,000 cwt. of wheat, 14,797,000 cwt. of rye, 5,181,000 cwt. of oats, 357,000 cwt. of barley—for all cereal crops, 30,065,000 cwt.; also 4,198,000 cwt. of potatoes. The field culture of melons and sunflowers is very widely spread, as also is gardening. Cattle-breeding is on the decline; in 1897 there were 535,660 horses, 792,710 horned cattle, 1,199,430 sheep, and 116,750 swine. On the other hand, the export trade in poultry, especially geese, has developed greatly. In 1897 the factories employed 25,165 workers, their aggregate returns being about 34,400,000 roubles. They mainly comprise steam flour-mills, oil-works, distilleries, timber mills, tanneries, and fur-dressing works. Weaving, the fabrication of agricultural machinery and pottery, boot-making, and a great variety of other trades are widely spread in the villages as domestic industries. The fairs of the province have lost much of their importance; that at Bekovo, however, in the district of Serdobsk, has held its own, especially as regards trade in cattle and animal products. The province is well provided with railways (862 miles in 1900).

Saratoff, the capital of the above government, on the right bank of the Volga, 532 miles by rail south-east of Moscow, and on the railway from Ryazan to the Urals. Its population increased from 86,000 in 1870 to 137,109 in 1897. The city is one of the best built in the provinces. Its factories occupy 3800 workers, and show an aggregate yearly return of 8,400,000 roubles. They chiefly comprise flour-mills, iron-works, oil-works, works for the manufacture of railway plant, and tobacco factories. Saratoff is a very important centre for the trade of eastern Russia. Its port shows an annual movement of 3400 vessels entered and cleared; 125,000 tons of (mainly) corn and flour are sent up the Volga every year, and 557,000 tons, chiefly of naphtha, by rail. In 1896 there were 96 primary schools, with 10,570 pupils, several technical schools, and Radischeff's museum, which is one of the richest in pictures, sculptures, and archæological collections in the provinces. The theatre is also one of the best in provincial Russia. Saratoff is the seat of several scientific societies, and publishes five newspapers. (P. A. K.)

Saratoga Springs, a village of Saratoga county, New York, U.S.A. It is situated in 43° 05′ N. and 73° 47′ W., in the southern foothills of the Adirondack mountains, in the eastern part of the state, at an altitude of 323 feet. The village has a fine water-supply from mountain springs. It is reached by three railways, the Delaware and Hudson, the Adirondack, and the Fitchburg. Saratoga is one of the best-known and most fashionable of American summer resorts. There are about forty springs, which differ widely in the constituents of their waters. The city contains many large hotels, boarding-houses, and hundreds of costly and beautiful villas. It has been a popular place for holding political conventions, and contains a Convention Hall, seating 5000 people. Saratoga Lake, 4 miles east of the city, is a favourite place for rowing races. Saratoga is known as the scene of the surrender of Burgoyne's army to the Americans under General Gates, which took place about 12 miles south-east of the village, on 17th October 1777, after a month's fighting in the neighbourhood. Population of the village (1890), 11,975; (1900), 12,409, of whom 1684 were foreign-born and 619 negroes.

Saravia, a town on the north-west coast of the island of Negros, Philippine Islands. It is situated in a rich sugar-producing region, and sugar culture is its only important industry. The language is Panay-Visayan. Population, 15,000.

Sarawak, a state situated in the north-west of Borneo, with an area of 50,000 square miles and a population of about 500,000. The coast line extends from Tanjong Datu, a prominent cape in 2° 3′ N., northwards to the mouth of the river Trusan, in 4° 58′ N. and 115° 13′ W., but a tract—80 miles in length—of Brunei territory still remains between the mouth of the river Baram and the river Limbang, the whole distance being about 440 miles in a straight line (but following the sinuosities, about 560 miles). In the year 1842 the government of the district from Tanjong Datu to the entrance of the river Sumarakan was obtained from the sultan of Brunei by Sir James

Brooke. The frontier of the southern portion of Sarawak is formed by the Serang, Kelingkang, and Batang Lupar ranges of mountains; inland, on the eastern side, the territory, along the watershed, is bounded by the following mountains: Batu Puteh (5000 feet), Tebang (10,000 feet), Ubat Siko (5000 feet), Bela Lawing (7000 feet), and Batu Leihun (8000 feet), from which the Rejang and Baram, on the Sarawak side, and the Koti and Balungun, on the Dutch side, take their rise. To the north of Sarawak is the Pamabo mountain range (8000 feet), situated in 3° 30′ N. and 115° 15′ W.—whence flow the rivers Limbang and Trusan—and the mountains Batu Lawei (8000 feet) and Lawas (6000 feet). The interior of Sarawak is mountainous, the greatest elevations being that of Mount Mulu (9000 feet), of limestone formation; Batu Lawei (8000 feet), Pamabo (8000 feet), Kalulong, Poeh, and Penrisan.

The Rejang is the largest river, the Baram ranking second, the Batang Lupar third, and the Limbang fourth. A formidable bar at the mouth of the Baram proves a great hindrance to shipping. The Rejang is navigable for small steamers for about 160 miles from its mouth. The chief town of Sarawak is Kuching, with a population of about 25,000. In 1885 the state was placed under British protection.

The fauna is exceedingly rich in all branches. The most important mammals are the mias, or orang utan, the gibbon, the proboscis, semnopithecus and macacus monkeys; lemurs, cats, otters, bears, porcupines, rhinoceros, wild pigs, wild cattle, deer, and pangolin. Bats, shrews, rats, and squirrels are included among the smaller mammals, while sharks, porpoises, and dugongs are found on the coast. Of birds, Sarawak has over five hundred species, including many kinds of thrushes, flycatchers, swifts, cuckoos, barbets, hawks, owls, pigeons, pheasants, and herons. Fish and reptiles are abundant; the jungle swarms with insect life, and is rich in many varieties of fern and orchid.

The mineral wealth gives promise of considerable development in the future. The Borneo Company have commenced working gold from the quartz reefs at Bau, on the Sarawak river, by the cyanide process, and have met with great success. Antimony and cinnabar are worked successfully in the same district by this company. Antimony occurs in pockets in various localities, notably at Sariki, in the Rejang district, and at Burok Buang and Telapak, in the Baram district, and in the river Atun. Cinnabar has also been found in small quantities at Long Liman and in the streams about the base of Mount Mulu. Sapphires of good quality, but too small to be of commercial value, are found in large numbers in the mountain streams of the interior.

Coal is worked at Sadong and Brooketon, whence it is shipped to Singapore. The great coal-field of Selantik, along the Kelingkang range in the Batang Lupar district, is about to be developed. Indications of coal seams have also been found in the river Mukah; at Pelagus, in the Rejang; at Similajau and Tutau and on Mount Dulit, in the Baram district.

Timber is one of the most valuable products, but at present, with the exception of billian (iron wood) from the river Rejang, very little is exported. The most important timbers to be found in the Borneo forests are: billian, merebo, rasak, kruin, tapang, kranji, benaga, bintangor, gerunggang, medang, meranti, and kapor. Except near the banks of the rivers, which have been cleared by the natives for farming purposes, the whole country is thickly clothed with timber.

The industrial establishments also comprise sago-mills, brick-works, cyanide-works, and saw-mills.

In 1900 the total trade was valued at $13,025,000, as compared with $4,564,200 in 1890. The following are the principal articles of export, with quantity and value given for the year 1900:—

Gutta	7,964 piculs	$78,829
Rubber	3,464 ,,	35,181
Rattans	41,340 ,,	27,999
Gambier	36,624 ,,	20,060
Pepper	32,967 ,,	125,442
Sago flour	215,910 ,,	75,026
Gold	45,180 oz.	84,370
Value of total imports		$6,159,120 or £615,912
,, ,, exports		$6,865,860 or £686,586

The revenue for 1900 amounted to $915,966 (as compared with $413,000 in 1890), and the expenditure to $901,172, leaving a surplus of $14,794.

The population of the state, in addition to a very small number of European government officials and others, consists of Malays, Dyaks, Melanaus, Kayans and Kenyahs, Kedayans and Muruts, with a large number of Chinese traders, and pepper planters.

The Government consists of the Raja, Sir Charles Johnson Brooke, G.C.M.G., who is absolute, assisted by a supreme council of seven, consisting of three chief European residents and four natives nominated by himself; there is also a general council of fifty, which meets every three years. For purposes of administration the country is arranged in four divisions, these being subdivided into districts. The first division consists of Sarawak proper, which comprises the districts of the river Sarawak and those of Lundu and Sadong. The second division is formed by the Batang Lupar, Saribas, and Kelakah districts. The third division consists of the Rejang, Mukah, Oya, and Bintulu districts; and the fourth division, of the Baram, Limbang, and Trusan districts. Each district is in charge of a Resident.

Since 1880 there has been a considerable increase of both population and territory, the increase of the former being estimated at 170,000 people, and of the latter at 15,000 square miles. On 12th August 1882 the Baram district from Kidurong Point to Baram Mouth, situated in the northern part between 3° and 4° 30′ N. and 113° and 115° 30′ W., with 100 miles of coast line and an area of 10,000 square miles, was ceded to Sarawak by the late sultan Mumin of Brunei. Three years later the Trusan district, in the far north, was also ceded to the Raja by the same sultan. A few years after these cessions had been obtained, many of the people of the Limbang—a large river which has one of its outlets passing through the town of Brunei—rose in rebellion against the sultan of Brunei, and as a solution of the difficulty their territory was annexed by Sarawak, with the subsequent approval of the British Government. The total area is therefore now 50,000 square miles.

The coast is well lighted, lighthouses having been built and maintained in good order at Tanjong Po, Sirik, Mukah, Oya, Tanjong Kidurong, Baram Mouth, and Brooketon.

The climate is equable, the daily temperature ranging on the average between 70° and 90°. The nights are generally cool. The rainfall averages about 200 inches annually; but falls during both the fine (S.W.) and the wet (N.E.) monsoon. (C. H.)

Sarcey, Francisque (1828–1899), French journalist and dramatic critic, was born at Dourdan, 8th October 1828. After his education was finished, he spent some years as schoolmaster in various lycées, but his independent and impetuous temperament was little fitted to the work. He abandoned it in 1858, and henceforward devoted himself to journalism. He contributed miscellaneous papers to the *Figaro*, *L'Illustration*, *Le Gaulois*, *Le XIX[e] Siècle*, and other periodicals; but his chief bent was towards dramatic criticism, of which he had his first experience in *L'Opinion Nationale* in 1859. In 1867 he began to contribute to *Le Temps* the "feuilleton" with which his name was associated till his death. His position as dictator of dramatic criticism was unique, and his influence enormous. He had the secret of taking the public into his confidence, and his pronouncements upon new plays were accepted as final. This was to a great extent justifiable, for he was a masterly judge of acting and of stage effect; his views as to the drama itself were somewhat narrow and indifferent to the march of events. He published several miscellaneous works, of which the most interesting are *Le Siège de Paris*, an account compiled from his diary (1871), *Comédiens et Comédiennes* (1878–84), *Souvenirs de Jeunesse* (1884), *Souvenirs d'âge mûr* (1892), *Quarante Ans de Théâtre* (1900, &c.). He died in Paris, 16th May 1899. (R. F. S.)

Sardhana, a town of British India, in the Meerut district of the North-Western Provinces; station on the North-Western Railway, 12 miles north-west of Meerut. Population (1891), 12,059; municipal income (1897–98), 11,046. Though now a decayed place, it is historically famous as the capital of the state founded at the end of the 18th century by the Begum Sumru. This extraordinary woman, who survived till 1836, was a Mussulman who married Reinhardt or Sombre (Sumru), the perpetrator of the massacre of British prisoners at Patna in 1763. On her husband's death in 1778 she succeeded

to the command of his mercenary troops. Ultimately she was baptized into the Roman Catholic Church, and bequeathed an immense fortune to charitable and religious uses. Her estate of Sardhana was the subject of litigation, and is now under the Court of Wards. She built here a Roman Catholic cathedral, a college for training priests, and a handsome palace.

Sardinia (Italian, *Sardegna;* French, *Sardaigne;* Spanish, *Cerdeña*), an island in the Mediterranean, about 140 miles from the west coast of Italy, of which kingdom it forms a part. Although the Italian Government neglected considerably the needs of the island during the last quarter of the 19th century, progress has undeniably been made. In 1881 the population was 682,002, and in 1901 it was estimated to be 789,314, or an average density of 85 per square mile. The populations of the chief cities are—Cagliari, 53,700; Sassari, 38,200; Iglesias, 12,000; Alghero, 12,000; Tempio, 12,000; Oristano, 8000; Ozieri, 8800; Bosa, 7000; Nuoro, 7000. The Sardinians are passionately attached to their island, and as a consequence emigration is comparatively small. The year 1896 furnished an exception to this general rule; in that year 2510 emigrants left the island, as compared with 150 in 1895 and 66 in 1892; the statistics for the years 1897–99 showed that emigration soon fell once more to insignificant proportions. The Sardinian is, as a rule, mild in character, hardworking, simple, and temperate in his habits. His domestic affections are extremely strong, as is also his attachment to the soil. This last sentiment is the chief cause of the excessive splitting-up of landed property. Politically the Sardinians are tenaciously attached to the existing institutions. At Sassari there exists a republican party which puts up its own candidates in general elections, but it is by no means *intransigéant* and still less subversive. The Sardinian clergy is favourably distinguished from the rest of the Italian clergy by its patriotic spirit. The Catholic party is most tolerant. Socialism counts few adherents. For administrative purposes the island retains the old division into 9 districts (*circondarii*) with a total of 364 communes. There are 12 parliamentary constituencies, but the island is represented in the senate by only 2 senators. Sardinia has a single court of appeal at Cagliari, 5 assize courts, and 6 common courts. There are 3 archbishoprics and 9 suffragan bishoprics; 2 intendants of finance, 2 chambers of commerce, and 9 agricultural unions.

Agriculture.—At least three-fifths of the Sardinian population are engaged in agriculture. Most of the remaining two-fifths are occupied in subsidiary industries, based upon the manufacture of agricultural products. Considerable progress was made in agriculture during the last twenty-five years of the 19th century, mainly as a result of the special agricultural schools established throughout the island. The old Sardinian plough is being replaced by modern ploughs, and attempts are being made to spread the use of artificial manure. Improved methods are being adopted for protecting vines against disease, and the importation of American vines has now ensured immunity against a repetition of former disasters. The cultivation of the vine prevails especially in the province of Cagliari, considerable progress having been made of late both in the extent of land under cultivation and in the ratio of produce to area. Between 1889 and 1896, the area under vines had increased from about 110,000 acres to 180,000 acres in four of the districts alone. The total extent of land covered by vineyards is calculated at 222,000 acres, giving a total average annual product of 5 million gallons. The entire island produced 19,809,000 gallons of wine in 1900, but 28,613,000 in the year 1899. The most flourishing districts are those of the Campidano of Cagliari, where intelligent and enterprising proprietors have pushed specialization in vine culture to a high degree, the district of Ogliastra, and the Campidano of Oristano, where the celebrated *vernaccia* is produced. Everywhere notable progress has been made.

Though much land previously devoted to grain culture has been planted with vines, the area under wheat, barley, beans, and maize is still considerable. Most of the Sardinian soil, except the rugged mountain regions, is adapted to corn growing. In 1896 the grain area was 380,000 acres, a slight diminution having taken place since 1882. The yield of corn varies from six to ten times the amount sown. In 1900 the total production of wheat in the island was 3,025,000 bushels. The low price of corn renders corn cultivation hardly profitable. The cultivation of olives is widespread in the districts of Sassari, Bosa, Iglesias, Alghero, and Callura. The Government is taking steps to check the decrease of olive culture in Sassari by offering prizes for the grafting of wild olive trees, of which vast numbers grow throughout the island.

Next to the wine-making industry, cattle-raising is becoming the principal source of wealth in Sardinia. Whereas in 1881 Sardinia was estimated to possess only 157,000 head of cattle, 478,000 sheep, and 165,000 goats, the numbers in 1896 had increased to 1,159,000 head of cattle, 4,960,000 sheep, and 1,780,000 goats. The nomadic system prevails in the island. Breeding is unregulated and natural selection prevails. The weaker animals either die off or do not breed, while those that do survive are poor in quality and in yield of products. A more progressive form of pastoral industry is that of the *tanche*, or enclosed holdings, in which the owner is both agriculturist and cattle raiser. On these farms the cultivation of the soil and the rearing of stock go hand in hand, to the great advantage of both. Nevertheless the idea of the value of improving breeds is gaining ground. Good cattle for breeding purposes are being imported from Switzerland and Sicily, and efforts are likewise being made to improve the breed of horses.

Trade and Industry.—Next to agriculture, mining is the principal Sardinian industry. It is carried on on a large scale, with capital and costly machinery. Although 583 mines of various metals have been assayed, only 100 are actively worked. The principal are those of Monteponi, near Iglesias, and those of Montevecchio, near Guspini. Lead, mixed with silver, zinc, copper, magnesium, and antimony are the chief minerals; lignite has been discovered, and is extracted in considerable quantities. In 1899 the province of Cagliari exported minerals to the value of 15,883,428 lire (nearly £600,000), an increase of 3,404,427 lire over 1898. The mines give employment to 12,060 workmen. The extraction of salt, monopolized by the Government, is another important industry. Formerly the Government leased the industry to a private company, but in 1900 resumed direct control of the works. The annual average production is 1,500,000 quintals (cwt). In 1899, 1,247,525 quintals were exported, a diminution of 412,148 quintals as compared with the total for 1898. The value of the salt produced in 1899 was 1,175,342 lire (£47,000). The tunny fisheries yielded in 1899 a value of nearly £62,000; but the industry is rapidly declining; and the coral fishery is almost extinct. Distilleries have grown up in large numbers since the Government abolished, by special laws for Sardinia, the heavy tax upon alcohol. It has, however, abolished also the premium previously accorded to distillers for exportation. Thus exportation has become practically impossible. Progress worthy of note has also been made in the tanning industry, the manufacture of artistic furniture, and in all kinds of printing.

Communications and Transport.—There exists a network of railways and ordinary roads, while numerous lines of steamers place the principal ports of the island in direct communication with Italy, Sicily, France, and the North African coasts. The high level of tariffs, both railway and maritime, has, however, prevented the realization of the advantages previously hoped for. Nevertheless the international trade of the province of Cagliari, where the chief ports are situated, attained in 1900 a value of £981,075, of which imports represented £238,340, and exports £742,735, 88 per cent. of this being for minerals. In 1899 this trade reached the value of £771,590; and the coasting trade a total of £1,449,550, making a total traffic of £2,221,140. While the ports of the island are entered annually by vessels aggregating 150,000 to 200,000 tons, engaged in foreign trade, the total entries of the foreign and coasting traffic by sea amounts to about 800,000 tons annually. The tariff war with France between 1887 and 1898 struck a heavy blow at Sardinian trade. Before that period Sardinian wine found its chief market in France. The loss of the chief market rendered inevitable a crisis, the consequences of which were scarcely counterbalanced by the efforts to find new outlets. Other industries were equally affected. Since the conclusion of the Franco-Italian commercial treaty of September 1898, and especially since the abrogation of the French decree, prohibiting the importation of Sardinian

cattle, in April 1899, trade with France has revived to some extent. Considerable trade is done in charcoal, but it leads to increasing deforestation without any rational provision for replanting.

Taxation.—It is estimated that Sardinia pays, in local and general, direct and indirect taxation of all kinds, 23,000,000 lire (£920,000), a sum corresponding to 35·44 lire per head.

Banks and Institutions of Credit.—In 1887 a severe banking crisis occurred in Sardinia. Though harmful to the general economic condition of the island, the crisis left agriculture comparatively unaffected, because the insolvent institutions had never fulfilled the objects of their foundation. Agricultural credit operations in Sardinia are carried on by the Bank of Italy, which, however, displays such caution that its action is almost imperceptible. An agricultural loan and credit company has been formed on the ruins of the former institutions, but hitherto no charter has been granted it. Institutions possessing a special character are the *monti frumentarii*, or public grain deposits, founded for the purpose of supplying peasant proprietors with seed corn, debts being paid in kind with interest after harvest. After passing through a period of decadence, the *monti frumentarii* are working well under regulations drafted and applied by the Rudini ministry in 1897.

Education.—Sardinia holds a low place in regard to education. In the province of Cagliari 73 per cent., and in that of Sassari 69 per cent., of the inhabitants neither read nor write. These figures, however, are steadily diminishing now that every commune in the island has at least a mixed school, and other schools are being opened year by year even in the mining districts. The university of Cagliari, which in 1874–75 had only 60 students, had 226 in 1899–1900. At Sassari in the same year there were 151. There are besides in the island 10 gymnasia, 3 lycées, 6 technical and nautical schools and institutes, and 9 other institutes for various branches of special education. A tendency is growing up towards the extension of technical and commercial education in place of the exclusively classical instruction hitherto imparted. To the growth of this tendency the excellent results of the agricultural schools have especially contributed.

Police.—A noteworthy improvement in the conditions of public safety has taken place. Robberies by armed bands, formerly frequent, have become rare, and the classical type of bandit is practically extinct.

The great needs of the island are (1) a legal remedy for the excessive subdivision of landed property; (2) regulation of the water-courses and mountain torrents; (3) replanting of forests; (4) a system of irrigation; (5) a vigorous administration; and (6) reduction of land and sea transport tariffs.

Sardou, Victorien (1831– ——), French dramatist, was born at Paris on 5th September 1831. The Sardous were settled at Le Cannet, a small village in the vicinity of Cannes, where they owned a fairly large estate, planted with olive trees. A night's frost killed all the trees and the family was ruined. The father of Victorien came to Paris in search of employment. He was in succession a book-keeper at a commercial establishment, a professor of book-keeping, the head of a provincial school, then again a private tutor and a schoolmaster in Paris, besides editing grammars, dictionaries, and treatises on various subjects. With all these trades and manifold occupations, he hardly succeeded in making a bare livelihood, and when at last he gave up the unequal struggle and retired to his native country, the boy Victorien was left to fight out the battle with his own resources. He had begun studying medicine, but had to desist for want of funds. He taught French to foreign pupils; he also gave lessons in Latin, history, and mathematics to students, and wrote articles for cheap encyclopædias. At the same time he was trying to make headway in the literary world. His precocious talents had been noticed and encouraged by an old *bas-bleu*, Mme de Bawl, who had published novels and enjoyed some reputation in the days of the Restoration. But she could do very little for her young *protégé*. Victorien Sardou made desperate efforts to attract the attention of Mlle Rachel, and to win her support by submitting to her a drama, *La reine Ulfra*, founded on an old Swedish chronicle. A play of his, *La Taverne des Étudiants*, was received and actually produced at the Odéon on the 1st April 1854, but met with a very stormy reception, owing to a rumour which had been circulated to the effect that the young *débutant* had been instructed and commissioned by the Government to insult and provoke the students. The unlucky *Taverne* was withdrawn after five nights. Another drama by M. Sardou, *Bernard Palissy*, was, however, accepted at the same theatre, but the arrangement was cancelled in consequence of a change in the management. A Canadian play, *Fleur de Liane*, would have been produced at the Ambigu but for the untimely death of the manager. *Le Bossu*, which he wrote expressly for Fechter, did not satisfy the actor; and when the play was at last successfully produced, the nominal authorship, by some unfortunate arrangement, had been transferred to other men. M. Sardou submitted to Montigny, manager of the Gymnase, a play entitled *Paris à l'Envers*, which contained the love scene, afterwards so famous, in *Nos Intimes.* Montigny thought fit to consult Scribe, who was revolted by the scene in question, and pronounced: "It is filthy! Where are we going to?" Such was the old man's verdict on the young playwright who was destined to follow closely in his footsteps and to uphold his dramatic system to the last.

Sardou felt the pangs of actual want, and the long series of misfortunes culminated in a severe attack of typhoid fever. He was dying in his garret, surrounded with his rejected manuscripts. A lady who was living in the same house unexpectedly came to his assistance. Her name was Mlle de Brécourt. She had theatrical connexions, and was a special favourite of Mlle Déjazet. She nursed him, cured him, and, when he was well again, introduced him to her old friend. Then fortune began to smile on the young author, and her favours rained on him as fast as her cruelties had done formerly. It is true that *Candide*, the first play he wrote for Mlle Dejazet, was stopped by the censor, but *Les Premières Armes de Figaro*, *Monsieur Garat*, and *Les Prés Saint Gervais*, produced almost in succession, had a splendid run, and *Les Pattes de Mouche* obtained a similar success at the Gymnase. Then Victorien Sardou carried everything before him, and all theatres were open to him.

He soon ranked with the two undisputed leaders of dramatic art, Augier and Dumas. He lacked the powerful humour, the eloquence and moral vigour of the former, the passionate conviction and pungent wit of the latter, but he was a master of clever and easy flowing dialogue. He adhered to Scribe's constructive methods, which combined the three old kinds of comedy—the comedy of character, of manners, and of intrigue—with the *drame bourgeois*, and blended the heterogeneous elements into a compact body and living unity. He was no less dexterous in handling his materials than his master had been before him, and at the same time opened a wider field to social satire. He ridiculed the vulgar and selfish middle class person in *Nos Intimes*, the gay old bachelors in *Les Vieux Garçons*, the modern Tartufes in *Séraphine*, the rural element in *Nos Bons Villageois*, the old-fashioned customs and antiquated political beliefs in *Les Ganaches*, the revolutionary spirit and those who thrive on it in *Rabagas* and *Le Roi Carotte*, the then threatened divorce laws in *Divorçons.*

He struck a new vein by introducing a strong historic element in some of his dramatic romances. Thus he borrowed *Théodora* from Byzantine annals, *La Haine* from

Italian chronicles, *La Duchesse d'Athènes* from the forgotten records of mediæval Greece. *Patrie* is founded on the rising of the Dutch *gueux* at the end of the 16th century. The French Revolution furnished him with three plays, *Les Merveilleuses, Thermidor*, and *Robespierre*. (The last named was produced by Sir Henry Irving at the Lyceum, and has never yet been seen on any French stage.) The Imperial epoch was revived in *La Tosca* and *Madame Sans Gêne*. In many of these plays, however, it was too obvious that a thin varnish of historic learning, acquired for the purpose, had been artificially laid on to cover modern thoughts and feelings. But a few—*Patrie* and *La Haine*, for instance—exhibit a true insight into the strong passions of past ages.

M. Sardou married his benefactress, Mlle de Brécourt, but eight years later he became a widower, and soon after the revolution of 1870 was married a second time, to Mlle Soulié, the daughter of the erudite Eudore Soulié, who for many years superintended the Musée de Versailles. He was elected to the French Academy in the room of Autran, and took formal possession of his seat on the 22nd May 1878.

Sark. See CHANNEL ISLANDS.

Sarnen, the capital of the west half (or Obwalden) of the Swiss canton of Unterwalden. It stands at a height of 1558 feet above the sea, at the north end of the Lake of Sarnen (3 square miles in extent), and on the river Aa. In 1900 the little town contained 3949 inhabitants. It has a large parish church on a knoll above, as well as two convents. In the archives is preserved the famous MS. known from the colour of its binding as the "White Book of Sarnen," which contains the earliest known version of the Tell legend. Sarnen is a station on the Brünig Railway, being 4½ miles from Alpnachstad, its port on the Lake of Lucerne, and 12½ miles below the summit of the Brünig Pass.

Sarnia, town and port of entry, Ontario, Canada, capital of Lambton county, 55 miles north-east of Detroit, on the left bank of the river St Clair. It is on the Grand Trunk and Lake Erie and Detroit River railways, and is a port of call for steamers plying on the Great Lakes. It contains a large oil-refinery which handles the whole product of the Ontario oil region; also salt, stove, carriage, and agricultural implement works, and flour-mills. The Grand Trunk Railway crosses the river at this point by the famous St Clair tunnel, 6025 feet long, or, including the approaches, 2¼ miles. Population (1891), 6692; (1901), 8176.

Sárospatak, a market-town of Hungary, in the county of Zemplén, on the Bodrog, with 6350 inhabitants in 1891 and 7911 in 1901, partly engaged in stone-industry. Its famous Calvinist high school (gymnasium, seminary, law academy) was founded in 1530, and conducted in the years 1650–54 by the celebrated pedagogue Amos Comenius. It possesses rich foundations and an excellent library (54,700 vols.), and affords free support and instruction yearly to some 300 students. There is an old fort, built in the 11th century, and near it a castle with an extensive park.

Sarpsborg, a seaport and manufacturing town of Norway, county Smaalenene, 68 miles by rail south-south-east of Christiania. It sprang into importance through the utilization of the falls in the river Glommen (Sarpsfos, 140 feet wide, 74 feet descent) for driving saw-mills, and especially for generating electric power. Since 1895 there have been built wood-pulp factories (one by an English company employing over 1000 hands), factories for calcium carbide (used for manufacturing acetylene gas), paper and aluminium factories, and spinning and weaving mills. There are two large electric supply stations, one of which furnishes Fredrikstad (7 miles to the south-west) with electric light. The port is at Sannesund, one mile south; its quays can be reached by vessels drawing 20 feet of water. The town was originally founded in the 11th century, and destroyed by the Swedes in 1567. The existing town dates from 1839. Population (1875), 3272; (1900), 6888.

Sarthe, a department in the north-west of France, watered by the river Sarthe.

Area, 2412 square miles. The population, 438,917 in 1881, had decreased to 422,944 in 1901. The births in 1899 were 8593, of which 705 were illegitimate; deaths, 9596; marriages, 3223. There were in 1896 821 schools, with 54,000 pupils, 8 per cent. of the population being illiterate. The land cultivated in 1896 measured 1,424,990 acres, of which 948,480 acres were arable and 22,230 acres vineyards. The department in 1899 raised wheat valued at £880,000; meslin, £160,000; rye, £120,000; barley, £280,000; oats, £223,000; potatoes, £492,000; mangold-wurzel, £44,000; vines, £143,000. Sarthe takes the first rank among the departments of France for the production of hemp, which in 1899 was valued at £108,000, while its crop of apples (1899) was estimated at £480,000. It owned in 1898 59,250 horses, 7440 asses, 209,680 cattle, 47,990 sheep, 100,530 pigs, and 20,690 goats. Mining in 1898 produced 10,000 metric tons of coal and 2277 tons of peat, but only 30 tons of iron. The spinning of hemp is extensively carried on. The distillation of 1898 counted only 81,000 gallons of alcohol. Le Mans, the capital, numbered in 1901, 62,948 inhabitants.

Sarzana, a town and episcopal see of the province of Genoa, Liguria, Italy, 10 miles east of Spezia, on a branch of the railway to Pisa. Its principal buildings are the cathedral (1355–1470), the former citadel (now gaol), and the castle of Sarzanello. It was the birthplace of Pope Nicholas V. It has one of the most important glass-bottle factories in Italy, also brick-works, and a patent fuel factory. Fruit, wine, and olive oil are cultivated in the vicinity. Population of commune (1881), 9845; about 14,500 (1899).

Saskatchewan River. See NELSON RIVER.

Saskatchewan Territory. See NORTH-WEST TERRITORIES.

Sassari, a town, archiepiscopal see, and capital of the province of Sassari, Sardinia, Italy, situated near the north-west corner of the island, 12 miles south-east of its port, Porto Torres, on the Gulf of Asinara. Fine modern quarters have been built on and beyond the site of the old Genoese walls and the citadel. It possesses provincial offices, the modern Gothic Giordano Palace, and the Duke's Palace (now municipal offices). The university, which in 1898 was attended by 148 students (24 professors), owns scientific collections, a library of nearly 40,000 volumes, and a collection of Carthaginian and Roman antiquities. There is a bronze bust of Mazzini (1889). The chief industries are the manufacture of matches, tobacco, and macaroni, tanning, and printing. Population (1881), 31,596; (1901), 38,178.

Satara, a town and district of British India, in the Deccan division of Bombay. The town is 2320 feet above the sea, near the confluence of the rivers Kistna and Yena, 56 miles south of Poona. Population (1881), 29,028; (1891), 29,601. The high school had 363 pupils in 1897–98. There are sixteen printing-presses, most of which issue a vernacular newspaper.

The district of SATARA has an area of 4987 square miles. Population (1891), 1,225,989, showing an increase of 15 per cent. after the disastrous famine of 1876–77; (1901), 1,146,521; average density, 229 persons per square mile, considerably the highest in the Deccan. The land revenue and rates are Rs.27,50,808, the incidence of assessment being R.1.1.3 per acre, again the highest in Deccan; cultivated area (1897–98), 1,529,541 acres, of which 124,738 were irrigated from wells, &c., including

9395 acres from Government canals; number of police, 1022; children at school (1897–98), 17,290, being 1·5 per cent. of the total population; registered death-rate (1897), 54 per 1000. The principal crops are millet, pulse, oil-seeds, and sugar-cane. The only manufactures are cotton cloth, blankets, and brass-ware. The district is now traversed from north to south by the Southern Mahratta Railway, which, however, passes 9 miles from Satara town. The Satara Agency comprises the two feudatory states of Phaltan and Aundh. Total area, 844 square miles. Population (1891), 131,529; (1901), 109,614. The estimated revenue of Phaltan is Rs.2,29,000; tribute, Rs.9600; estimated revenue of Aundh, Rs.18,900; no tribute. The chief of Aundh is the descendant of a Brahman official of Sivaji, called the Pratinidhi.

Sátoraljaujhely, a corporate town of Hungary, capital of the county of Zemplén, at the foot of Hegyalja, with 13,017 inhabitants in 1891 and 16,886 in 1901. The most remarkable buildings are the gymnasium, the hospital, and the tobacco factory. Its population is partly engaged in viticulture. In the vicinity is the village of Széphalom, where dwelt Francis Kazinczy, the initiator of modern Hungarian literature.

Sâtun. See MALAY PENINSULA.

Satsuma Islands, a group of islands belonging to Japan, lying westwards of the province of Satsuma (31° 40′ N. and 129° 40′ E.). The two principal are Kami-Koshiki-jima, which measures 24½ miles by 5½, and Shimo-Koshiki-jima, which measures 8½ miles by 5¼.

Saugor, or SAGAR, a town and district of British India, in the Jubbulpore division of the Central Provinces. The town is 1758 feet above the sea; railway station. Population (1881), 44,416; (1891), 44,674. The cantonments contain a battery of artillery, a detachment of a European regiment, a native cavalry and a native infantry regiment. The town is handsomely built, and an emporium of trade. The Government high school had 849 pupils in 1896–97.

The district of SAUGOR has an area of 4007 square miles. Population (1891), 591,743, showing an increase of 5 per cent.; (1901), 470,666; average density, 117 persons per square mile. The land revenue is Rs.5,70,000, the incidence of assessment being R.0.4.7 per acre; cultivated area, 754,777 acres, of which 5943 were irrigated from wells; number of police, 735; boys at school (1896–97), 6343, being 13·8 per cent. of the male population of school-going age; girls at school, 1391, being 3·2 per cent., the highest proportion in the province; death-rate (1897), 85·39 per 1000. The principal crops are millet, wheat, pulse, oil-seeds, and a little cotton. The branch of the Indian Midland Railway from Etawah to Saugor was extended to Damoh in 1898, and opened throughout to Katni, on the East Indian line, in 1899.

Saújbulágh, the principal town of the Mukri district, in the province of Azerbaiján in Persia, in a fertile valley, about 30 or 40 miles south of Lake Urmia, at an elevation of 4270 feet, in 36° 46′ N. and 45° 47′ E. It has post and telegraph offices, and a population of about 7000, mostly Kurds of the Mukri tribe, and exports dried fruit, grain, and tobacco. There are many more localities with this name (Turkish, meaning cold stream, or cold spring) in Persia, the most notable, after the above-mentioned Kurdish city, being a district of the province of Tehran, with many villages.

Sault Ste Marie, a city of Michigan, U.S.A., capital of Chippewa county. It is at the rapids of the river St Mary, the outlet of Lake Superior, at the eastern end of the Upper Peninsula. There are three railways, the Canadian Pacific, the Duluth, South Shore, and Atlantic, and the Milwaukee, St Paul, and Sault Ste Marie. The industries of the city are in great part connected with lumber, there being many saw and shingle mills, besides flour-mills, foundries, and machine shops. The river is here crossed at the head of the rapids by a fine railway bridge. The rapids make a descent of 18 feet in half a mile. For the use of commerce these have been avoided by locks; the first, on the American side, having been superseded by a second and larger one, the largest in the world, and capable of holding the largest vessel on the lakes. The Canadians, also, have built a lock on their side of the river. Population (1880), 1947; (1890), 5760; (1900), 10,538, of whom 5329 were foreign-born.

Savage Island. See POLYNESIA.

Sávah, a small province of central Persia, situated north of Irák and south-west of Tehran, comprising the districts of Sávah, Khalejistán (inhabited by the Turkish Khalej tribe), Zerend, and Karaghán. It pays a yearly revenue of about £5000. The capital is the ancient city of Sávah, which has a population of about 7000, and is situated 72 miles south-west of Tehran, at an elevation of 3380 feet, in 35° 4′ N. and 50° 30′ E. The soil is very fertile, is well watered, and produces much wheat, barley, and rice. It is occasionally joined to the province of Tehran in order to facilitate the governor's arrangements for supplying the capital of Persia.

Savannah, a city and seaport of Georgia, U.S.A., capital of Chatham county. It is situated in 32° 05′ N. and 81° 06′ W., on the river Savannah, near its mouth. Its site is in part on low ground, in part on a cliff. It has an excellent water-supply from artesian wells, and is well sewered. The harbour has been deepened by dredging by the United States Government. Formerly one of the chief export ports, especially for cotton, it has lost its relative position, not because of a decrease in business, but because of an increase in that of its rivals, especially New Orleans and Galveston. Its exports, chiefly cotton, fertilizers, and naval stores, had a value in 1898 of $28,937,614. Its imports were trifling. It is at the junction of five railways, the Central of Georgia, the Florida Central and Peninsula, the Georgia and Alabama, the Plant System, and the Southern. In 1900 it contained 155 manufacturing establishments, with a total capital of $5,716,491. They employed 2870 hands, and the product was valued at $6,461,816. The principal item of manufacture was fertilizers. The manufacture of lumber also was of importance, as was the cleaning and polishing of rice. The assessed valuation of real and personal property was, in 1900, $37,108,077, the net debt was $3,196,350, and the rate of taxation was $25·95 per $1000. Population (1890), 43,189, of which 22,978, or 53 per cent., were negro; (1900), 54,244, of whom 3434 were foreign-born, and 28,090, or 52 per cent., were negroes. Of 15,994 males 21 years of age and over, 2628 were illiterate (unable to write), of whom 2435 were negroes.

Savigliano, a town of the province of Cuneo, Piedmont, Italy, 32 miles south of Turin by rail. It has important iron-works and foundries and silk manufactures, as well as sugar factories, printing, and cocoon raising; also a technical school. Population (1881), 10,990; (1899), about 11,250.

Savings Banks.—*The United Kingdom.*—The early history and working of savings banks down to 1884 is given in considerable detail in the ninth edition of this work. It is therefore only necessary to repeat that the idea of receiving small sums on deposit from the comparatively poorer classes, which seems to have been first suggested by Daniel Defoe, gradually developed from the middle of the 19th century in various parts of Europe, and especially in the United Kingdom. Like all sound movements for the welfare of the community, that of the extension of savings banks grew on a solid

basis, and in a great variety of forms. Many Acts of Parliament have been passed for the management of these institutions in Great Britain, culminating in the establishment on a very broad basis of the Post Office savings banks, which are treated in a separate article in this work. It may be said that the promotion of thrift, which was at the end of the 18th century an experiment, commenced and carried on by a few far-seeing individuals, had by the end of the 19th century become to be almost universally adopted, and to be regarded practically as an adjunct to the institutions of every civilized community. Friendly societies, co-operative societies, trade societies, and other agencies, all being based on this same principle of thrift, or the husbanding of small resources for future use, have been brought into existence, and now count their members by hundreds of thousands. The idea has also developed, that in order to render schemes of savings as far-reaching as possible, and to embrace the less thrifty and thoughtful in the community, these institutions should be brought even to the doors of those for whom they are intended, and who might otherwise neglect or overlook the benefits they are intended to afford.

Trustee savings banks.

Many of the old trustee savings banks which were put on a systematic basis in 1817, have been absorbed by the Post Office, but while the total amount of their deposits increases, the number of their depositors remains about the same. In 1863 there were 622 of these banks carrying on operations with 1,558,000 depositors, and deposits amounting to £40,563,000. In 1889 the number of banks had decreased to 380, with 1,500,000 depositors, and £45,000,000 of deposits; while in 1898 they had still further decreased in number to 231, but still had 1,527,000 depositors, and their deposits had increased to £49,500,000. The reason for this is that the smaller trustee savings banks, open often only once a week for a short time, do not and cannot give such facilities as the Post Office, which is open every day and all day. Further than this, owing to the break up of the Cardiff bank in 1886, and other smaller irregularities, a select committee of the House of Commons was appointed to inquire into these banks. By the recommendations of this committee, an independent and permanent inspection committee was appointed, which has carried on its work of inspection ever since, and reports annually to Parliament. This action has rather tended to merge the smaller trustee savings banks in the Post Office. At the same time the large banks continue to do a very great business, and have become in many ways similar to ordinary joint stock banks, affording to persons of smaller means daily facilities for saving.

Those who have studied the habits of thrift among the people have usually come to the conclusion that its development depends largely on the ready facilities which exist for its exercise. To this fact may perhaps be attributed the efforts, already referred to, that have been made in various directions for establishing some means of saving close to the places where wages are paid. To carry out this idea, some of the large railway corporations have obtained powers in special Acts of Parliament to establish savings banks for those in their employment. The success of these banks has been great, though it has varied much, and it is difficult to trace any general rule of progress. Thirteen of such institutions return their operations to the Registrar of Friendly Societies. The total amount held was, by the same return for 1898, £3,016,146 in 38,503 accounts. In these banks the interest paid, as well as the deposits, are really guaranteed by the whole assets of the companies. Further, in order to encourage thrift among their employés, the companies have formally agreed and bound themselves, by the provisions of their special Acts, that the rate of interest paid shall be higher than can be obtained in the open market on the same security. Thus the South-Eastern and Chatham Railway gives 4 per cent., and their 4 per cent. debenture stock, which is not a better security than the savings bank, is considerably above par.

Other efforts have been made to establish savings banks at factories, to be open at the time wages are paid. One great difficulty, however, has been met with, and that is the objection many of those employed have to their employers knowing of their savings, and their fear lest it may affect their rate of pay. To get over this objection the plan has been tried of employing an outside agency to hold the savings bank. This has not been much more successful, as the suspicion that accounts may be looked at by employers is difficult to overcome. It is found that the most successful savings banks are those which are carried on as a business, where the transactions are so numerous that the individual feels that his own private account is not likely to become known.

Penny banks.

Another class of savings bank which of late years has developed considerably, is the penny bank. These banks have a twofold object: one to provide facilities for putting by extremely small sums for those whose means are very limited, and the other to attract children in their earliest years so as to train them to habits of thrift and the realization of the importance and use of even quite small savings. Some form of penny bank now exists in nearly every district, and indeed in nearly every parish. No returns have been collected, but it may be safely said that there are tens of thousands in operation. Many of these penny banks are feeders to the Post Office, which gives them special advantages to invest in that institution. Not only is the gross amount of money thus taken large, but (what is more important) the habit of thrift and of husbanding resources is being taught to the young in all parts of the United Kingdom. This has been one cause of the large extension of the Post Office savings bank itself, and has no doubt led to considerable change in the habits of the people. In a few cases successful efforts have been made to establish permanently these penny banks on a commercial basis, as in the case of the Yorkshire Penny Bank, which has 928 branches, 432,786 depositors, and deposits, £12,500,861; and the National Penny Bank, which has 13 branches in London, most of them open from 9 in the morning till 9 at night, with 129,228 depositors, and £1,811,334 in deposits on the 31st December 1899. The establishment of penny banks in schools has been carried on for many years, and it is difficult to exaggerate the useful work they have done in inculcating habits of thrift in the children, and in adding depositors to the Post Office savings banks when the children start in life. In England and Wales as many as 7393 of these savings banks were held in the 19,937 elementary schools inspected by the Education Department. The number seems to be somewhat diminishing—in 1894, 8668; in 1895, 8410; in 1896, 8065; in 1897, 7489. The reason for this diminution may be the very great amount of clerical labour which the conduct of these institutions imposes on the teachers in addition to their many other duties. The Board schools in London have done much to promote this movement. From the last return of these institutions under the London School Board, it appears that school penny savings banks are held in 231 departments of these Board schools. In these during 1898 there were 41,879 depositors on the books, who deposited £17,428 in the year; of this sum, £16,692 was withdrawn, leaving with previous balance £6161 in hand. This may not be considered a large financial result with over half a million children on the

registers, but its educational effect is considerable. It is also found that many children open accounts at outside penny banks in preference to going to those carried on at their own schools, though it is probable that the idea of so doing is often suggested by the school savings bank.

With a view of bringing the savings bank still nearer the doors of the people, efforts have been made to establish collecting savings banks. In these the collector calls at fixed periods for the deposits. This scheme has grown out of the investigations of a committee of the Charity Organization Society, and is based on the idea, which undoubtedly is the fact, that many people will make contributions when the money is called for, who will not take the trouble to walk a few yards themselves to make the same deposit. That this is so is proved most conclusively by the Post Office life insurance experience, a branch of the Post Office which is scarcely used by the people, while at the same time collecting life insurance companies (which of course must charge a considerable extra premium for collecting) do business to the extent of millions. From the report of these collecting savings banks in 1898, it appears that 49 such institutions were in operation in England, the number of depositors being about 23,000, and the amount deposited in the year about £20,000. In most of these banks no interest is given, but facilities and encouragements are afforded for the transfer of each individual account to the Post Office as soon as it is large enough to earn interest.

Closely allied, though essentially different, are the very numerous sharing-out clubs which may be called temporary savings banks. These nearly all take a weekly subscription from their members, and, should any member die, his representative receives a certain sum, the balance left being divided at Christmas equally among the survivors, in proportion to the weekly subscriptions. Some of these clubs are registered, and a rough estimate in 1899 gave the number as 847, with 115,000 members. The unregistered are, however, much more numerous, though no official information is to be had of them, and it is certain that hundreds of thousands of pounds are divided in this way each Christmas.

The attempt to induce sailors and soldiers to exercise habits of thrift by the establishment of naval savings banks under the Act of 1866, and military savings banks under the Act of 1859, should be mentioned. The amount in the naval savings bank in March 1898 was £262,772. As might be expected the amount does not grow. This is accounted for by the fact that the depositors leave the service and draw out their savings. About £200,000 a year, however, goes in and out of the naval banks, and £80,000 in the army banks. This sum represents a good deal of self denial, when the margin within which it is possible to save among sailors and soldiers is considered.

Closely allied to savings banks are a number of societies which need only be briefly referred to here. The largest of them are building societies under the Act of 1874, which are a very popular form of saving, especially in certain localities. The contributions to the shares of these societies, which are paid by instalments, differ but little from the periodical payments into savings banks; and although the money is not so readily repaid, notice and other forms having to be gone through, large numbers of persons pay in and draw out money, and receive the interest on the shares in much the same way as they do on deposits in savings banks without any idea of building or buying houses. In 1898 the receipts were £38,394,220 in the United Kingdom, and the accumulated capital was more than £57,000,000, with a membership of 619,741. The action of industrial and provident societies regulated under the Act of Parliament of 1893, must also be mentioned with reference to that part of their business which is closely allied to savings banks. These societies are divided into three classes:—(*a*) ordinary co-operative societies with 1,256,666 members; (*b*) societies for carrying on various businesses, including loan and banking, with 42,312 members; (*c*) land and building societies, with 11,144 members. The total, therefore, is 1,310,122 members. Most of these societies, indirectly or directly, act as savings banks, and have had considerable influence in the growth of thrift in the United Kingdom. In the co-operative societies the sales amounted to more than £48,000,000, and the profits to nearly £5,000,000. These profits are divided in different ways among the members, and they form a saving fund of large dimensions. The societies for carrying on various businesses, such as working men's clubs, loan and banking organizations, registered under the 1893 Act, numbered 127 in 1898, with total receipts £1,773,849. These are not rapidly increasing, but they must be included as one exhibition of the savings of the people, and they are practically used as savings banks. The land and building societies under the Act of 1893 are not the same as those above referred to, though their action as regards savings is similar. They are not under the Act of 1874, but carry on a trade or business, including dealings of any kind in land. Their operations are slightly increasing. They received £131,739 from subscriptions and other sources, according to the last return in 1898, and the value of the land and mortgages was £632,790. Two other classes of institutions should be referred to, the friendly and trade societies, which exist for special purposes, namely, to make provision in sickness, for death, for a want of employment, and to a limited extent for old age. They differ essentially from savings banks, as the subscriptions are parted with and cannot be withdrawn. But as the subscriptions are for certain definite needs, almost certain to be required by each member, which but for those societies would have to be provided for by direct savings in banks, they must be mentioned in treating of the subject as a whole. The amount held by the friendly societies is estimated at £37,917,702, subscribed by 11,424,810 members. The income from 630 trade societies in 1898 was £2,856,354, received from 1,219,474 members.

The general conclusions to be drawn from the progress of savings banks of all kinds during the last quarter of the 19th century must certainly be that facilities exist, and are in active operation for the exercise of thrift in many new channels. The gross number of members must form a large proportion of the entire population, even allowing for the fact that many are making use of several of the forms of savings banks that have been referred to. It was once stated, and with truth, that the national debt was held by a very small proportion of the population; but this is not so now. The various agencies which may be described as savings banks in different forms, hold at least £200,000,000, or a third of the National Debt of Great Britain. (x.)

United States.

There are two kinds of savings banks in the United States, *Mutual Savings Banks*, or savings banks proper, and *Stock Banks*, having capital and doing a combined commercial and savings business. To these might be added *School Savings Banks*. There are no postal banks of this kind. All these institutions are organized under the laws of the states where they are located, and are generally under the supervision of an officer appointed by the governor. The distinctive feature of *Mutual Savings*

Banks is that they have no capital, and do a strictly investment business, all their earnings going to the depositors. Their management is vested in a board of trustees, a self-perpetuating body who serve without pay, except for specific service such as appraising property. Executive officers and clerks are paid moderate salaries. The proportion of annual expense to each dollar of assets is sometimes less than ·0025. The rate of interest on deposits usually ranges from 3 to 4 per cent. Depositors have no voice in the management, except as citizens of the state, through their representative in the state legislature. Nearly all the states limit investments carefully, though a few permit considerable latitude: in New York the deposits in savings banks are considered next to Government bonds as safe investments. In eight out of the fifteen states having mutual savings banks, deposits are exempt from taxation; in the others the rate varies from $\frac{1}{4}$ to $\frac{3}{4}$ of 1 per cent. The amount which each person may deposit each year or half-year and the total amount to his credit are usually limited by the by-laws. Deposits are in practice generally payable on demand, though the banks reserve the right to require notice, generally from sixty to ninety days, and sometimes enforce this right in times of panic. The first savings bank incorporated in the United States was the Provident Institution for Savings, incorporated in Boston in 1816. The oldest in New York is the Bank for Savings, of New York City, incorporated in 1819. The largest deposit of any bank of this kind in the United States, $67,735,560, is that of the Bowery Savings Bank of New York. Mutual savings banks are confined chiefly to the New England and Middle states. There is no other kind of savings bank in Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, and New Jersey. The growth of banks in these states from 1887 to 1897 was as follows:—

	1887.	1897.
Number of banks	593	646
Number of depositors	3,030,094	4,311,972
Amount of deposits	$1,099,313,155	$1,667,486,734
Average to each depositor	362	386

The only mutual banks outside the North-Eastern states are four in Ohio, five in Indiana, four in Minnesota, and one each in West Virginia and Wisconsin.

Though the laws governing mutual banks vary in the different states, the following abstract of the New York Savings Bank Law of 1875, re-enacted in 1892, and subsequently amended, gives the main principles on which they are organized. It is of especial interest in view of the fact that the savings banks of New York are the most important banking institutions chartered by any of the states:—

Thirteen or more persons may incorporate a savings bank, two-thirds of whom shall be residents of the county where the proposed bank is to be situated. When the certificate of organization is filed with the superintendent of banks, who exercises supervision over all banks chartered by the state, he is required to ascertain whether the bank is in fact needed in the community where it is to be organized, and to investigate the character and general fitness of the trustees. The present superintendent of banks requires that the incorporators of a savings bank shall defray personally the expenses of the institution until its earnings are sufficient to meet such expenses, and also return dividends at the rate of 3 per cent. The board of trustees have entire control of the management of the bank. They elect the president and other officers. A trustee who borrows any of the bank's funds, or who becomes a surety for any other borrower, forfeits his office. Trustees are not allowed to have any interest in the profits, or to borrow the deposits or funds of the bank.

The trustees of any savings bank may invest the moneys deposited therein and the income derived therefrom as follows:—1. In the stocks or bonds or interest-bearing notes or obligations of the United States, or those for which the faith of the United States is pledged, including the bonds of the District of Columbia. 2. In the stock or bonds or interest-bearing obligations of this state. 3. In the stocks or bonds or interest-bearing obligations of any of the United States which has not within ten years defaulted in the payment of any part of any debt authorized by its legislature. 4. In the stocks or bonds of any city, county, town, or village, school district bonds, and union free school district bonds, issued for school purposes, or in the interest-bearing obligations of any city or county of this state. 5. In the stocks or bonds of a number of specified cities without the state, subject to the condition that if at any time the indebtedness of any of said cities, less its water debt and sinking fund, shall exceed 7 per cent. of its valuation for purposes of taxation, its bonds and stocks shall cease to be an authorized investment. 6. In bonds and mortgages on unencumbered real property situated in this state, worth at least twice the amount lent thereon. Not more than 65 per cent. of the whole amount of deposits shall be so lent or invested. If the loan is on unimproved and unproductive real property, the amount lent thereon shall not be more than 40 per cent. of its actual value. No investment in any bond and mortgage shall be made by any savings bank, except upon the report of a committee of its trustees. 7. Also, by virtue of a law passed by the legislature of 1898: In the first mortgage bonds of any railway corporation of this state, or in the mortgage bonds of any such railway corporation of an issue to retire all prior mortgage debt of such railway corporation, provided the bonds satisfy certain precautionary conditions. Not more than 20 per cent. of the whole amount of deposits shall be thus lent or invested. Street railway corporations shall not be considered railway corporations within the meaning of this section. An Act passed in 1900 permits the investment of deposits in the bonds of certain railways situated in other states. These investments must conform to conditions assuring safety.

Savings banks in New York are preferred creditors of insolvent state banks and trust companies. In 1901 a law was passed providing for a tax of 1 per cent. on the surplus of savings banks, computed on the par value of their securities. In the year 1900 the resources of the savings banks exceeded those of both the discount and deposit banks and of the trust companies chartered by the state; in 1900 the savings banks held $1,000,209,099; the discount and deposit banks $323,864,743; and the trust companies $672,190,671. The deposits in the savings banks amounted to $887,480,650, distributed amongst 1,981,371 depositors; interest credited for the preceding year amounted to $29,539,688; expenses for the year were $2,629,835, or $2·62 for each $1000 of resources. Loans on real estate, secured by bond and mortgage, amount to $406,210,574, and investments in stocks and bonds, market value, $502,265,621. The gain in resources in 1899 was over $76,000,000, and was the highest ever known. The savings depositors through their banks have purchased $3,733,000 of the state debt, $146,399,233 of the bonds of cities in the state, and $43,420,043 of town, county, village, and school district bonds.

Stock Savings Banks do not as a rule differ from ordinary banks of deposit and discount, except in receiving smaller sums on deposit. They are found in the more purely agricultural parts of the country, the Southern, Mississippi Valley, and Western states, where only a small proportion of people earn wages in manufactures and commerce, suitable investments are not numerous, the benefits of mutual savings banks are not familiar, and the people are unwilling to accept a low rate of interest. In some states having stock banks there are no laws relating to banking, and in others the savings banks carry on their business under the same laws as commercial banks. Several of the states restrict the investments of the stock savings banks. Prior to 1865, when the issue of circulating notes by state banks was suppressed by a prohibitory tax, there was a distinction between state banks and stock savings banks; the former could issue notes, while the latter, as a rule, could not. Stock savings banks are conducted frequently as adjuncts of state and national banks, occupying the same rooms and being under the same management.

The law of the state of Iowa, enacted in 1874, is typical of those states where stock banks are under public supervision. A savings bank may be organized by not less than five persons. In towns of ten thousand inhabitants or less it must have a capital of $10,000, and in towns or cities with more than ten thousand inhabitants $50,000. The usual corporate powers are granted. The amount of deposits is limited to ten times the paid-up capital, and in case

this amount should be exceeded, the capital must be increased in proportion. The usual provisions for repayments of deposits are made, and in addition the savings banks are given the privilege of requiring sixty days' notice for the withdrawal of deposits.

The banks are allowed to invest their funds in the following securities:—(1) Stocks, bonds, or interest-bearing notes of the United States. (2) Stocks, bonds, or evidences of debt bearing interest of the state of Iowa. (3) Stocks, bonds, and warrants of any city, town, village, or school district in the state regularly issued, but the investments of any savings bank should not consist of such bonds or warrants to a greater amount than 25 per cent. of the assets. (4) Mortgages or debts on unencumbered real estate within the state worth at least twice the amount lent. (5) It is lawful for such banks to discount, purchase, sell, and make loans upon personal or public security, except shares of their own capital stock.

Property acquired by foreclosure of mortgages, &c., may not be held more than ten years. The rate of interest to be paid is left to the discretion of the trustees, and the profits, after the payment of such interest and expenses, go to capital stock. Stockholders are liable to the creditors for double their stock, and for such liabilities continued for six months after the transfer of any stock. Directors receive no compensation. Officers and directors of the bank are required to give the same security for loans that is required of others, and such loans can only be made by the board in the absence of the party applying. The savings banks are prohibited from lending to any individual or firm more than 20 per cent. of the capital stock. All savings banks are required to make a quarterly statement to the auditor of the state, giving in detail the statement of condition upon a given day. This statement is made under oath of the officers, and is required to be published. The state auditor is given the power to examine any savings bank at any time, and should the conditions warrant, he is required to report to the attorney-general, who institutes proceedings under the law relating to insolvent corporations. Provision is made for increasing the capital stock by a two-thirds vote of the existing shares. The corporate existence of the banks is placed at fifty years.

Under the above law the number of banks increased from 19 in 1875 to 195 in 1899; their capital from $755,500 to $7,800,000; and the deposits from $2,338,685 to $48,147,860. In 1899 the 287 stock savings banks of the United States held savings deposits amounting to $218,759,168 and deposits subject to check, $2,538,125.

Loans and Investments.—In his annual report dated 31st October 1899, the comptroller of the currency gave data of the loans and investments of 942 out of the 987 savings banks in the United States, of which 655 were mutual and 287 stock banks. As the banks are not under his supervision, being under the control of the respective states, reports are available from only such banks as choose to send them. The loans of the 942 banks aggregate $1,098,598,589, of which $878,126,859 were secured by real estate, $156,359,308 by collateral other than real estate, and $64,112,422 by personal and other security. The investments in United States bonds amount to $136,930,208; state, county, and municipal bonds, $512,777,336; railway bonds and stocks, $167,998,336; bank stocks, $36,637,920; other stocks, bonds, and securities, $230,796,388.

The following are the statistics as to the deposits of the total number of mutual and stock savings banks in the United States:—

Years.	No. of Banks.	No. of Depositors.	Deposits.	Average due each Depositor.	Average per Caput in the U.S.
1896	988	5,065,494	$1,907,156,277	$376.50	$26.68
1897	980	5,201,132	1,939,376,035	372.88	26.56
1898	979	5,385,746	2,065,631,298	383.54	27.67
1899	987	5,687,818	2,230,366,954	392.13	29.24

School Savings Banks were first established in the United States in 1885 by J. H. Thiry, at Long Island City, New York. On 1st January 1900 the system was in use in 526 schools, distributed throughout 97 cities or villages and 15 states. Out of 179,630 pupils registered in these schools, 52,694 have saved $806,0159, of which $525,209 has been withdrawn, leaving a balance of $280,806 due depositors. In those parts of the country where there are no savings banks their place is largely supplied by building and loan associations. For further details see the articles on the several states. (B. R*.)

Savoie, a department of the south-east of France, bordering on Italy, traversed by the chain of the Alps and its ramifications, and watered by the Isère and Arc.

Area, 2389 square miles. The population, 266,438 in 1881, had decreased to 249,460 in 1901. The births in 1899 were 5853, of which 315 were illegitimate; deaths, 5577; marriages, 1670. The schools in 1896 numbered 989, with 47,000 pupils, 2 per cent. of the population being illiterate. The acreage under cultivation in 1896 amounted to 854,620, of which only 219,830 acres were in plough-land and 24,700 acres in vines. The wheat grown in 1899 was valued at £155,000; rye, £98,000; oats, £56,000; maize, £40,000; potatoes, £148,000; natural pastures, £402,000; tobacco, £40,000; walnuts, £78,000. The vintage of 1899 was valued at £248,000. The horses in Savoie (1899) numbered only 3080, the asses, 5200; cattle, 124,840; sheep, 71,630; pigs, 11,980; goats, 15,900. Savoie in 1896 produced 10,582 metric tons of coal, 6217 tons of lignite, 140 tons of peat; 636 tons of iron; and 69 tons of other minerals, of a total value of £5500. The industry in metals registered (1898) 29 metric tons of iron and 162 tons of steel, amounting, with inclusion of the other metals, to the value of £6100. The other industries are in a backward state. Chambéry, the capital, had 22,108 inhabitants in 1901.

Savoie, Haute-, a department of south-east France, bordering on the Lake of Geneva and on Switzerland, and dominated by Mont Blanc.

Area, 1775 square miles. The population, 274,087 in 1881, had decreased to 259,595 in 1901. The births in 1899 were 6010, of which 310 were illegitimate; deaths, 5534; marriages, 1771. There were in 1896 917 schools, with 43,000 pupils, 1 per cent. of the population being illiterate. The land under cultivation in 1896 comprised 827,450 acres, of which 291,460 acres were plough-land and 18,525 acres in vines. The wheat produce of 1899 was valued at £358,000; oats, £113,000. The vintage of the same year was estimated at £234,000; the potato crop, £241,050. In green crops (trefoil and sainfoin) the department reaped in 1898 the value of £256,000, and its natural pastures and grass lands yielded £412,000. Its live stock included 10,040 horses, 1950 mules, 13,090 cattle, 35,580 sheep, 28,210 pigs, and 23,940 goats. Mining in 1898 produced 215 metric tons of coal, 40 tons of peat, and 2660 tons of bitumen, valued altogether at £1510. Metallurgical industry turned out (1898) 2310 metric tons of iron and 440 tons of steel, valued at £21,000. Other industries are silk, tanning, and weaving. Annecy, the capital, had in 1901, 13,611 inhabitants.

Savona, a town and episcopal see of the province of Genoa, Liguria, Italy, on the coast of the west Riviera, 26 miles west by south of Genoa by railway. It is one of the chief seats of the iron industry, having iron-works and foundries, iron shipbuilding, railway workshops, engineering shops, brass foundry, tinplate works, sulphur mills, and glass-works. It is also a considerable seaport, importing commodities to the value of nearly two millions sterling (£1,754,300 in 1899), chiefly coal, with petroleum, iron, cereals, &c. There is a small export trade (£30,000 to £40,000 annually), of which preserved tomatoes, wood, and candied fruits are the chief elements. In 1899 the port (22 to 26 feet deep) was entered by 1139 vessels of 559,200 tons, as compared with 855 vessels of 356,300 tons in 1892. There are a technical institute and a commercial institute. Population (1881), 24,481; (1899), about 28,500.

Savory, Sir William Scovell, Bart. (1826–1895), British surgeon, was born 30th November 1826, in London. He entered St Bartholomew's Hospital in 1844 (M.R.C.S. 1847, F.R.C.S. 1852). From 1849 to 1859 he was demonstrator of anatomy and operative surgery at St Bartholomew's, and for many years curator of the museum, where he devoted himself to pathological and physiological work. In 1859 he succeeded Sir James Paget as lecturer on general anatomy and physiology. In 1861 he became assistant surgeon, and in 1867 surgeon, holding the latter post till 1891; and from 1869

to 1889 he was lecturer on surgery. In the College of Surgeons he was a man of the greatest influence, rising to be president for four successive years, 1885–88. As Hunterian professor of comparative anatomy and physiology (1859–61), he lectured on "General Physiology" and the "Physiology of Food." In 1884 he delivered the Bradshaw Lecture on the "Pathology of Cancer." In 1887 he delivered the Hunterian Oration. In 1879, at Cork, he had declared against "Listerism" at the meeting of the British Medical Association; "the last public expression," it has been said, "by a prominent surgeon against the now accepted methods of modern surgery." In 1887 he became surgeon-extraordinary to Queen Victoria, and in 1890 he was made a baronet. Savory was an able operator, but averse from exhibitions of brilliancy, and was altogether a powerful and authoritative man in his profession; his lucidity of expression being almost as valuable in that respect as his great knowledge of physiology and anatomy. He died in March 1895.

Sawantwari, or SAVANTVADI, a native state of India, in the Konkan division of Bombay. Area, 926 square miles. Population (1891), 192,948; (1901), 217,800; average density, 235 persons per square mile.

The estimated gross revenue is Rs.4,31,867, of which Rs.46,814 was expended on public works in 1897–98; no tribute; military force, 400 men; number of schools, 170, with 6386 pupils in 1897–98, being 3·2 per cent. of the population, compared with 2·4 per cent. for Bombay generally. The chief, whose title is Sir Desai, is a Maratha of the Bhonsle family. The late chief, who had been educated at the Rajkot College, died in December 1899, with no direct heir. It has special manufactures of ornaments carved out of bison-horn, painted and inlaid lacquer-work, and gold and silver embroidery. The town of SAWANTWARI, or Wari, is 17 miles from the seaport of Vengurla. Population (1881), 8584; (1891), 9269; municipal revenue (1897–98), Rs.6348, the incidence of taxation being 9 annas per head. It was founded in 1670, on the edge of an artificial lake amid hills. There is a high school, and Westropp hospital, with an endowment of Rs.10,000, raised to commemorate the Diamond Jubilee.

Saxe, John Godfrey (1816–1887), American poet, was born at Highgate, Vermont, 2nd June 1816. He graduated at Middlebury College in 1839, and became a lawyer, being at one time attorney-general of Vermont. He also engaged in politics as a Democrat, and edited a newspaper in Burlington; but he was best known as a humorous poet and a lecturer. His swiftly-moving lines abounded in puns and witty turns, his travesties and satires found many readers or listeners, and some of his love lyrics or other pieces combined sparkle with real feeling. During a part of his later life he was editor of the *Evening Journal* at Albany, New York, where he died 31st March 1887.

Saxe-Altenburg, a duchy of Germany, one of the Thuringian states, has an area of 511 square miles, and a population (1895), 180,313; (1900), 194,273, of whom 95,442 were males and 98,831 females; the density being 380 inhabitants to the square mile. In 1895 the Protestants numbered 168,549, or 93·5 per cent., and the Roman Catholics 2091. In the same year the duchy contained 16,180 farms, of which 13,589, or 84 per cent., were each less than 25 acres. The live stock in 1900 totalled 69,172 cattle, 66,895 pigs, 12,282 horses, and 9860 sheep. The lignite mines yielded (1900) 1,865,517 tons, valued at £229,300. For the period 1899–1901 the state revenue was fixed at £228,600 annually, and the expenditure at approximately the same. The public debt in 1900 amounted to £44,370, and the contribution to the imperial exchequer in 1901 to £98,550.

Saxe-Coburg-Gotha, a duchy of Germany, one of the Thuringian states, with an area of 755 square miles, and population (1895), 216,603; (1900), 229,567, of whom 110,949 were males and 118,618 females; the density being 304 inhabitants to the square mile. About 98 per cent., or 212,514, of the inhabitants were Protestants, and 2956 Roman Catholics. In 1895 the duchy comprised 29,458 farms, of which 15,230 were each less than 2½ acres in extent and 11,100 between 2½ and 25 acres. The number of persons supported by agriculture was 60,633, or 28 per cent. of the population. In 1900 the live stock numbered 95,988 pigs, 68,780 cattle, 47,718 sheep, and 10,301 horses. The public revenue during the period 1899–1901 was fixed at £135,600 annually, and the expenditure at £165,800; in addition, there was a special revenue for the duchy of Coburg of £70,960 annually, and expenditure of £63,740, and a special revenue of £126,150 annually for the duchy of Gotha and an expenditure of £177,210. The public debt of Coburg amounted in 1900 to £141,560, and of Gotha to £107,330; and in 1901 their joint contribution to the imperial exchequer to £116,350. The duke of Albany, grandson of Queen Victoria, succeeded to the duchy in 1900 on the decease of his uncle, the duke of Edinburgh, who had become duke of Saxe-Coburg-Gotha in 1893.

Saxe-Meiningen, a duchy of Germany, one of the Thuringian states, with an area of 953 square miles, and population (1895), 234,005; (1900), 250,683; of whom 123,027 were males and 127,656 females. Density, 263 inhabitants to the square mile. Of the total population in 1895, 228,969, or 98 per cent., were Evangelical Lutherans, 3188 Roman Catholics, and 1487 Jews. Agriculture supports 67,540, or 29 per cent. of the population. Out of the total number of farms (31,907), in 1895, 15,370 were each under 2½ acres in extent, 13,469 between 2½ and 25 acres. In 1900 the live stock numbered 74,491 cattle, 80,322 pigs, 31,232 sheep, and 7780 horses. For the period 1900–02 the public revenue was fixed at £437,225, and the public expenditure at £394,430. The public debt in 1901 amounted to £415,175, and the contribution to the imperial exchequer to £127,225.

Saxe-Weimar, a grand-duchy of Germany, one of the Thuringian states, with an area of 1388 square miles, and a population (1895), 339,217; of whom 325,315, or 95·9 per cent., were Evangelical Lutherans, 12,112 Roman Catholics, and 1290 Jews. In 1900 the population was 362,018, of whom 176,650 were males and 185,368 females. In 1895 the population was rural to the extent of 60·3 per cent., the rest being urban (39·7 per cent.). During the years 1890–98 inclusive, an average of 119 persons emigrated annually; in 1900 they numbered 86. The university of Jena is common to the four Saxon duchies. The supreme court of Jena serves as a common court of appeal for these duchies, for Schwarzburg-Rudolstadt, for the two Reuss principalities, and for certain parts of Prussia. The number of persons supported by agriculture in 1895 was 123,011, or 36·2 per cent. of the population. The total number of farms in 1895 was 42,227, of which 16,575 were each less than 2½ acres and 19,419 between 2½ and 25 acres. In 1900 the live stock numbered 156,995 pigs, 134,628 cattle, 88,300 sheep, and 22,207 horses. For the financial period, 1899–1901, the state revenue and expenditure were balanced at £523,000. In 1900 the public debt was £97,000, and in 1901 the amount contributed to the imperial exchequer £183,550.

Saxony, a kingdom of the German empire, ranking fifth in area, third in population, and first in density.

Area and Population.—The census returns for 1885, 1895, and 1900, together with the area and density of the

kingdom and its administrative districts, are given in the subjoined table:—

District.	Population, 1885.	Population, 1895.	Population, 1900.	Area in sq. miles.	Density per sq. mile in 1900.
Bautzen .	356,560	385,080	405,092	953	425
Dresden .	860,558	1,067,757	1,216,044	1674	726
Leipzig . .	774,036	945,179	1,059,273	1377	769
Chemnitz .	1,190,849	734,044	791,896	799	991
Zwickau .		655,628	727,453	984	739
Total .	3,182,003	3,787 688	4,199,758	5787	726

The former district of Zwickau has been divided into the two new districts of Chemnitz and Zwickau, and the 1895 population (1,389,672) is duly divided for that year between them. Of the total population in 1900, 2,042,437 were males and 2,157,321 females, or 1056 females to every 1000 males. As will be seen, the density is exceptionally high—in fact, the highest in the empire, with the exception of the Hanseatic towns.

The average density of the entire empire in the year 1900 was 270. Of the total population in 1900, 2,100,475, or 50·01 per cent., lived in towns, the remaining 49·99 per cent. in rural communes. The largest towns of the country in 1900 were Leipzig (455,089), Dresden (395,349), Chemnitz (206,584), Plauen (73,891), Zwickau (55,825), and eight others with above 20,000 inhabitants each. The next table shows the movement of the population for the years 1888 to 1899:—

	Marriages.	Total Births.	Illegitimate.	Total Deaths.	Birth-rate.	Death-rate.	Illegitimacy percentage.	Marriage Rate.
Annual average, 1888–97	..	151,000	..	96,109	41·8	26·6	12·6	9·1
1898	38,611	162,555	21,059	92,785	41	22	12·9	9·1
1899	38,980	164,164	21,148	99,609	40·4	24·5	12·9	9·6

The number of emigrants gradually diminished from 4920 in 1892 to 950 in 1897, and, after an increase to 1128 in 1898, again fell to 876 in 1900; the annual average for the ten years 1889–98 being 2521.

Agriculture.—In 1895 agriculture supported 716,450 persons, or 19 per cent. of the population. The annexed table shows the farms classified according to size:—

Under 2½ acres.	Between 2½ and 25 acres.	Between 25 and 250 acres.	Above 250 acres.	Total Farms.
96,796	67,685	28,392	754	193,627

In 1900 there were 687,587 cattle, 576,825 pigs, 166,713 horses, and 74,518 sheep in the kingdom.

Industry and Mining.—In 1898, 501,677 persons were engaged in these occupations, distributed as follows:—178,571 in the textile industries, 74,234 in the manufacture of machinery and instruments, 92,807 in mining, quarrying, and smelting and founding metals; 34,573 in forestry, saw-milling, &c.; 27,088 in paper manufacture; 22,230 in printing and similar branches; and the rest (72,174) in other branches. In 1900, 120 coal-mines were in active work, 89 being lignite mines; their output was 6,343,213 tons, valued at £3,230,600. There were 13 iron and salt mines at work, and they produced 13,087 tons of ore, valued at £24,000, and 8 mines of cobalt, nickel, and bismuth produced 595 tons of ore valued at £29,650. The iron works, foundries, &c., produced 342,152 tons of iron and steel, valued at £3,507,850; the breweries 107,386,650 gallons of beer, the distilleries 2,965,100 gallons of pure alcohol, and the sugar factories 19,850 tons of sugar. Quarrying is extensively carried on, over 3800 persons being employed in quarrying sandstone near Pirna alone.

Communications.—In 1900, 1880 miles of railway were open for traffic, all except 25 miles belonging to the state. In 1898 the telegraph lines reached a total of 3750 miles, and telegraph wires 17,910 miles; the length of telephone lines was 2685 miles.

Religion and Education.—In 1895, 3,611,670 persons, or 95·3 per cent. of the population, belonged to the Evangelical Lutheran Church, 140,285 were Roman Catholics, 10,538 were "Reformists," 15,059 belonged to other Christian sects, and 9902 were Jews. The university of Leipzig ranks after Berlin and Munich in respect of the number of students attending it (3586 in 1900–01). The remaining educational facilities embrace the technical high school (polytechnic) at Dresden, 2 "provincial" schools, 17 classical, and 10 semi-classical schools, 34 "modern" schools, 22 seminaries, and 3 higher girls' schools. There are also about 4340 elementary and advanced elementary schools in the kingdom, and they are attended by approximately 792,200 children. In 1900 the mining academy at Freiberg had 330 students; the 2 mining schools, about 150 pupils; the academy of forestry at Tharandt, 89 pupils; the 7 schools of navigation (1898), 17 teachers and 157 pupils; the veterinary high school, 212 students: besides which there are 2 art academies, 3 industrial art schools, 2 conservatories of music, a shorthand institute, school of political economy, 4 architects' schools, some 200 schools for training artisans and designers in special industries, 8 agricultural and horticultural schools, 44 commercial schools, 15 music schools, and 1 dramatic school. The military schools are mentioned in the next section.

Army.—In 1900 the peace footing of the Saxon army (12th Army Corps of the imperial forces) numbered 43,288 men of all arms. The cadet school at Dresden has about 250 pupils, and 2 non-commissioned officers' schools at Marienberg are attended by 500 men.

Finances.—For the period 1900–01 the ordinary annual revenue was fixed at £4,609,900, and the ordinary annual expenditure at the same figure; but there were in addition an extraordinary revenue and an extraordinary expenditure, balancing at £4,934,100, this expenditure being for public works. Of the ordinary revenue £2,504,400, or 54½ per cent., was derived from state-owned sources, *e.g.*, forests, domain lands, mines, the porcelain factory of Meissen, and railways (£1,784,100). Direct taxes, chiefly income-tax, yielded £2,105,500. The amount upon which income-tax was levied was £83,326,100 in 1894, and £110,703,670 in 1900. Out of the total number of persons who paid income-tax in 1898, viz., 1,467,070, no less than 1,396,218, or 95 per cent., paid on incomes under £165 per annum, and of these again 319,813 paid on incomes between £20 and £25 a year. In 1900 the amount of the national debt was £41,491,120, and in 1901 the amount contributed to the imperial treasury £2,133,650. See *Kalender und Statistisches Jahrbuch für das Königreich Sachsen auf das Jahr 1900, &c.* (Dresden, 1899).

Saxony, a province of Prussia, with an area of 9750 square miles, and population (1895), 2,698,549; (1900), 2,833,224; of whom 1,389,204 were males and 1,444,020 were females. The mines in 1897 yielded 13,009,653 tons of lignite, valued at £1,583,750 (in 1900, 17,035,074 tons valued at £2,101,200); 273,364 tons of coal, valued at £55,700; 716,348 tons of kainite, valued at £505,900; 640,236 tons of potassium salts, valued at £379,700; and 632,168 tons of copper, valued at £909,700 (in 1900, 671,918 tons valued at £1,108,850); total value in 1897, £3,434,750. The produce of salt-works and furnaces, &c., in 1900 was 108,734 tons of salt, worth £147,600; 163,458 tons of chloride of potassium, worth £1,040,050. The province of Saxony is famous for its high-class farming, and ranks as the first agricultural province of all Germany. Besides the university agricultural college at Halle, there are two agricultural colleges and six agricultural schools, as well as two experimental stations, in the province. The barley and chicory (50 per cent. of that grown in Germany) of Saxony are famous. In 1900 the live stock included 1,259,737 pigs, 833,580 sheep, 778,353 cattle, and 213,040 horses. This province, especially in the neighbourhood of Erfurt, Quedlinburg, and Aschersleben, is far-famed for its gardening and seed farms. The sugar factories in 1900 produced 447,895 tons of sugar; the breweries, 53,700,000 gallons of beer; and the distilleries, 3,897,300 gallons of pure alcohol. For further particulars, see under PRUSSIA. See also "Agriculture in Germany," *Brit. Cons. Rep.*, No. 452 (1898).

Say, Jean Baptiste Léon (1826–1896), French statesman and economist, was born in Paris on 6th June 1826. From his father, Horace Say, and his grandfather, Jean Baptiste, the author of a celebrated *Traité d'économie politique*, founded on Adam Smith, he inherited

an ardent zeal for economic studies, of which he gave a remarkable proof by publishing at the age of twenty-two a brief *Histoire de la Caisse d'escompte*. He was at first destined for the law, next entered a bank, and finally obtained a post in the administration of the Chemin de fer du Nord. Meanwhile he became a regular contributor to the *Journal des Débats*, where he established his reputation by a series of brilliant attacks on the financial administration of the prefect of the Seine, Haussmann. He displayed a remarkable talent for interesting popular audiences in economic questions. His sympathies, like those of his grandfather, were with the British school of economists; he was, indeed, the hereditary defender of free-trade principles in France. He had, moreover, an intimate acquaintance with the English language and institutions, and translated into French Goschen's *Theory of Foreign Exchanges*. He was one of the pioneers of the co-operative movement in France. Elected to the Assembly of 1871 by the departments of Seine and Seine-et-Oise, he adopted the former, and took his seat among the Moderate Liberals, to whose principles he adhered throughout his life. He was immediately chosen as reporter of the commission on the state of the national finances, and in this capacity prepared two elaborate statements. Thiers, though opposing their publication on grounds of public expediency, was much struck by the ability displayed in them, and on 5th June appointed Say prefect of the Seine. The fall of the Empire, the siege of Paris, and the Commune had reduced the administration of the capital to chaos, and the task of reconstruction, amid the urgent problems that called for immediate solution, severely tried the new prefect's power of organization. This was, however, a gift with which he was pre-eminently endowed; and he only quitted his post to assume, in December 1872, the ministry of finance—a remarkable tribute to his abilities from Thiers, who himself held strongly protectionist views. In all other respects Say always regarded himself as the disciple of Thiers, who, in his last public utterance, designated Say as one of the younger men who would carry on his work. He fell from office with Thiers on 24th May 1873, and was elected president of the Left Centre group, as whose candidate he unsuccessfully contested the presidency of the Chamber with Buffet. In spite of their divergence of views, he consented, at the urgent request of President MacMahon, to take office in March 1875 in the Buffet Cabinet; but the strongly reactionary policy of the premier led to a sharp and long-continued dispute between him and Say both in the press and in the constituencies, and brought about Buffet's resignation. Say continued to hold the ministry of finance under Dufaure and Jules Simon, and again in the Dufaure ministry of December 1877, and its successor, the Waddington ministry, till December 1879. During this long period, in which he was practically the autocratic ruler of the French finances, he had first to complete the payment of the war indemnity—an operation which, thanks largely to his consummate knowledge of foreign exchanges, was effected long before the prescribed time. It was at a conference held between Say, Gambetta, and M. de Freycinet in 1878 that the great scheme of public works introduced by the latter was adopted. Say's general financial policy was to ameliorate the incidence of taxation. As a pendant to his free-trade principles, he believed that the surest way of enriching the country, and therefore the Treasury, was to remove all restrictions on internal commerce. He accordingly reduced the rate of postage, repealed the duties on many articles of prime utility, such as paper, and fought strongly, though unsuccessfully, against the system of *octrois*. On 30th April 1880 he accepted the post of ambassador in London for the purpose of negotiating a commercial treaty between France and England, but the presidency of the Senate falling vacant, he was elected, on 25th May, to fill the post, having meanwhile secured a preliminary understanding, the most important feature of which was a reduction of the duty on the cheaper class of French wines. In January 1882 he became minister of finance in the Freycinet Cabinet, which was defeated in the following July on the Egyptian question. Say's influence over the rising generation grew less; his "academic Liberalism" was regarded as old-fashioned; Socialism, which he never ceased to attack, obtained even greater power, and free-trade was discarded in favour of M. Méline's policy of protection, against which Say vainly organized the *Ligue contre le renchérissement du pain*. He had, however, a large share in the successful opposition to the income-tax, which he considered likely to discourage individual effort and thrift. In 1889 he quitted the Senate to enter the Chamber as member for Pau, in the belief that his efforts for Liberalism were more urgently needed in the popular Assembly. Throughout his career he was indefatigable both as a writer and as a lecturer on economics, and in both capacities exerted a far wider influence than in parliament. Special mention must be made of his work, as editor and contributor, on the *Dictionnaire des finances* and *Nouveau dictionnaire d'économie politique*. His style was remarkably easy and lucid, and he was often employed in drawing up important official documents, such as the famous presidential message of December 1877. He was for many years the most prominent member of the Académie des Sciences Morales et Politiques, and in 1886 succeeded to Edmond About's seat in the Académie Française. He died in Paris on 21st April 1896. A selection of his most important writings and speeches has since been published in four volumes under the title of *Les Finances de la France sous la troisième République* (1898–1901). (H. SY.)

Sayre, a borough of Bradford county, Pennsylvania, U.S.A. It is on the North Branch of the river Susquehanna and on several railways, in the north-eastern part of the state. Population (1900), 5243, of whom 337 were foreign-born.

Scarborough, a municipal and parliamentary borough and fashionable watering-place, Yorkshire, England, North Riding, in the Whitby parliamentary division, 40 miles north-east of York by rail. A promontory divides the town into north and south parts. The former was greatly improved by the addition of the promenade and drive, known as the Royal Albert Drive and Clarence Gardens, opened in 1890. In 1891 the corporation purchased Ramsdale Valley bridge, spanning a picturesque ravine which separates the southernmost part of the town from the rest. The People's Park occupies both sides of the valley. Modern public buildings include the church of St James's, two Wesleyan chapels, a Congregational chapel, Constitutional and Liberal clubs, and central fire station. Population of the municipal and parliamentary borough (1881), 30,504; (1901), 38,160.

Schaffhausen, one of the Swiss cantons. Its total area is 113½ square miles. Of this, 108·4 square miles are classed as "productive," forests covering 44·8 square miles, vineyards 4·2 square miles, and arable or pasture land the remaining 59·4 square miles. The population of the canton was 37,783 in 1888, while in 1900 it was 41,514. In 1900 there were 365 inhabitants to each square mile. The people are mostly Protestant—roughly, the Roman Catholics number 10 per cent.—and German-speaking. With the exception of a small portion of the town of Stein, the whole canton lies north of the Rhine.

The cantonal constitution is that of 1876, slightly modified. The legislature is elected as stated in the ninth edition of this work, but only "communes" with over 250 inhabitants form separate electoral circles, the smaller being united electorally to their greater neighbours. The executive of five members is also elected by popular vote for four years. Besides the right of "initiative" of 1000 citizens as to legislative projects, and the revision of the cantonal constitution, there was adopted in 1895 the "obligatory referendum" for all legislative projects, as well as a curious institution (formerly existing in several cantons) by which the legislature can consult the people on certain questions involving principles, and not merely fully drafted legislative projects. In 1897 the state revenue of the canton was 1,647,481 francs (a rise of 42 per cent. since 1885), and the state expenditure, 1,564,118 francs (a rise of 46 per cent.), while in 1898 the surplus was 95,999 francs; the system of accounts in this canton is rather intricate. In 1897 the public debt was *nil*. The taxes are very small, while the state property is the most considerable in Switzerland, so that from a financial point of view it is the most favoured among the Swiss cantons.

AUTHORITIES.—*Beiträge z. vaterländ. Geschichte.* Schaffhausen, 1863-84.—IM THURN. *Der Kant. S.* St Gall and Bern, 1840.—PFAFF. *Das Staatsrecht d. alten Eidgenossenschaft.* Schaffhausen, 1870 (pp. 89-97 contain a history of Schaffhausen). In 1901 there appeared at Schaffhausen two elaborate historical "Festschriften," one for the canton and the other for the town. (W. A. B. C.)

Schaffhausen, the capital of the above canton. There is a railway ($1\frac{1}{4}$ miles) to Feuerthalen (1253 inhabitants), the first station on the line to Constance, which keeps on the Swiss side of the Rhine. There is a fine promenade on the west of the town, called the Fäsenstaub. Population (1880), 11,753; (1900), 15,275.

Schandorph, Sophus. See DANISH LITERATURE.

Scharf, Sir George (1820–1895), director of the British National Portrait Gallery, was born in London on 16th December 1820, the son of George Scharf, a Bavarian miniature painter who settled in England in 1816, and died in 1860. He was educated at University College School, and studied in the schools of the Royal Academy. In 1840 he accompanied Sir Charles Fellows on the second of his archæological visits to Asia Minor, and in 1843 acted as draughtsman to a Government expedition to the same country. After his return he devoted himself with great industry and success to the illustration of books relating to art and antiquity, of which the best known are Macaulay's *Lays of Ancient Rome*, 1847; Milman's *Horace*, 1849; Kugler's *Handbook of Italian Painting*, 1851; and Dr Smith's classical dictionaries. He also engaged largely in lecturing and teaching, and took part in the formation of the Greek, Roman, and Pompeian courts at the Crystal Palace. He acted as art secretary to the great Manchester Art Treasures Exhibition of 1857, and in that year was appointed secretary to the newly founded National Portrait Gallery. The remainder of his life was given to the care of that institution, which during the thirty-seven years of his able and zealous management gradually developed into a collection of first-rate importance. Scharf acquired an unrivalled knowledge of all matters relating to historic portraiture, and was the author of many learned essays on the subject. He was elected a fellow of the Society of Antiquaries in 1852, and a corresponding member of the Archæological Institute of Rome in 1858. In 1885, in recognition of his services to the Portrait Gallery, he was made C.B., and on relinquishing his post, early in 1895, was created K.C.B. and a trustee of the Gallery. He died on the 19th April of the same year. (F. M. O'D.)

Schaumburg-Lippe, a principality of Germany, in the valley of the Weser, between the Prussian provinces of Westphalia and Hanover. Area, 131 square miles. Population (1895), 41,224; (1900), 43,132; of whom 21,449 were males and 21,683 females. The people are almost entirely Evangelical Lutherans. Density, 329 inhabitants to the square mile. Of the total population in 1895, 11,725, or 28·4 per cent., were supported by agriculture. The number of farms was 7218, of which 6585, or 91 per cent., were each less than 25 acres; 625 were between 25 and 250 acres, and only 8 exceeded 250 acres. In 1900 the principality contained 32,243 pigs, 12,434 cattle, 4088 horses, and 1632 sheep. The state revenue and expenditure for 1900 were estimated to balance at £53,530. The public debt amounted in 1900 to £24,100, and in 1901 the contribution to the imperial exchequer to £21,845.

Scheffel, Joseph Victor von (1826–1886), German poet and novelist, was born at Carlsruhe, where his father was an officer in the Baden army, 16th February 1826. His mother, *née* Krederer, was a poet of some distinction. He went to school at Carlsruhe, and afterwards studied law at Munich, Heidelberg, and Berlin. After graduating *doctor juris*, he held a secretaryship for a short time, and subsequently was appointed to various judicial posts. Eventually, in 1854, he retired in order to devote himself entirely to his pen, coming to this determination as a consequence of the great success achieved by his poem *Der Trompeter von Säckingen*, published in 1853. The popularity of this work in Germany has been extraordinary, more than 200 editions of it having been issued. In 1857 he published *Gaudeamus* (a volume of poems) and a historical romance, *Ekkehard*, which also became very popular. In 1864 he married Caroline von Malzen and settled at Carlsruhe, where he lived practically in retirement. He died there on 9th April 1886. His later works never achieved the popularity of those mentioned above, which by themselves were sufficient to procure him enthusiastic eulogiums and various marks of honour on his "jubilee," which was celebrated all over Germany. He was on this occasion granted a patent of hereditary nobility by the grand duke of Baden. His works subsequent to *Ekkehard* were *Frau Aventure* (1863), *Juniperus* (1868), *Waldeinsamkeit* (1880), *Der Heini von Steier* (1883). Volumes of *Reisebilder* (1887), *Gedichte* (1888), *Episteln* (1892), and *Briefe* (1898) were published posthumously. (R. F. S.)

Scheldt, a river flowing through France, Belgium, and Holland. In its Belgian course it is regulated by locks as far as Ghent, below which it flows freely east and north to the estuaries indenting Zeeland, which are, however, really inlets of the sea, being at many places over 3 miles broad from dyke to dyke, and showing no movement but the ebb and flood of the sea. The river water running through these estuaries is, moreover, shrinking in breadth, and the alluvium, especially between the islands, is accumulating. The Dender, a tributary on the right bank, and the Lys, on the left, are both largely canalized. At Antwerp the Scheldt at high water has a breadth of 1706 feet. Sixteen miles north-west of Antwerp the river divides at Fort Bath (Holland) into the Western and the Eastern Scheldt. The Western Scheldt flows, between Dutch Flanders on the south and the islands of South Beveland and Walcheren on the north, into the North Sea at Flushing. Altogether the Scheldt is navigable for 207 miles. On the north side, near Flushing, and along the south coast of South Beveland, as also on the south side near Terneuzen, the Western Scheldt has a depth of 131 feet. Steamers ply between these places and Fort Breskens, on the south bank opposite Flushing. The roadstead of Zierikzee (island of Schouwen) and the navigable water along the northern coast of North Beveland have a depth of 100 to 130 feet. The strait (Mastgat) between the islands of Tholen and North Beveland is

also very deep. The Sloe, an arm of the Western Scheldt between Walcheren and South Beveland, and also both sides of the dyke connecting South Beveland with North Brabant, are silting up; the Braakman, a southern arm of the Western Scheldt, is fast drying up. The difference of level between ebb and flood tide is at Flushing 12, at Antwerp 14, feet.

Schenectady, a city of New York, U.S.A., capital of Schenectady county. It is situated in 42° 47′ N. and 73° 57′ W., in the valley of the river Mohawk, 17 miles north-west of Albany, in the eastern part of the state, at an altitude of 246 feet. It is irregularly laid out, the older and business part of the city being in the valley, while the newer and residential portion is built on higher land in the rear. Its water-supply is pumped and filtered. The city is reached by branches of the Delaware and Hudson and the New York Central and Hudson River railways. The manufacturing interests are very important. There are extensive locomotive, electrical, and agricultural implement works, besides foundries, car works, planing mills, and clothing factories of various kinds. It is the seat of Union College (founded 1795), which had in 1900 a faculty of 24 and was attended by 184 students. Population (1890), 19,902; (1900), 31,682, of whom 7169 were foreign-born and 127 negroes. Of 11,093 males 21 years of age and over, 656 were illiterate (could not write).

Scherer, Edmond Henri Adolphe (1815–1889), French theologian, critic, and politician, was born in Paris, 8th April 1815. After a course of legal studies he found himself strongly attracted to theology, and spent several years in theological study at Strasburg, where he graduated and was ordained. In 1843 he was appointed to a professorship in the École Evangélique at Geneva, but the development of his opinions, which were becoming strongly in favour of the Liberal movement in Protestant theology, led to his resigning the post six years later. Having had already some experience of journalism, he now settled in Paris, where he at once attracted attention by brilliant literary criticisms contributed to the *Revue des Deux Mondes* and other journals. He was elected municipal councillor at Versailles in 1870, deputy to the National Assembly for the department of Seine-et-Oise in 1871, and senator in 1875. As a politician he was a steady supporter of the Republican party. Towards the end of his life he devoted himself mainly to literary and general criticism, and was for many years one of the ablest contributors to *Le Temps*. His critical work is marked by keen insight, individuality, and remarkable lucidity of expression. He was a frequent visitor to England, and took a lively interest in English politics and literature. He died at Versailles, 16th March 1889. His chief works are: *Dogmatique de l'église réformée* (1843), *De l'état actuel de l'église réformée en France* (1844), *Esquisse d'une théorie de l'église chrétienne* (1845), *La Critique et la Foi* (1850), *Alexandre Vinet* (1853), *Lettres à mon Curé* (1853), *Études critiques sur la littérature contemporaine* (1863), *Études critiques de littérature* (1876), *Diderot* (1880), *La Démocratie et la France* (1883), *Études sur la littérature au xviii^e^ siècle* (1891). A memoir of him, by V. C. O. Gréard, appeared in 1890. (R. F. S.)

Scheveningen, a fishing village and fashionable watering-place in the Dutch province of South Holland, 2 miles north-west of The Hague, with which it is connected by the old and the new road, and by horse, steam, and electric tramways. Among modern buildings is the large Kurhaus (1886), with a Kursaal accommodating 2900 guests. Many villas have been built for the requirements of about 20,000 annual visitors, chiefly Dutch and Germans. The fishing fleet comprises about 200 boats, and a new fisher-haven is to be constructed at the mouth of the Hague–Scheveningen Canal. Population (1900), about 20,000.

Schiedam, a manufacturing town and seaport in the Dutch province of South Holland, near the influx of the Schie into the Maas. In 1899 there were 190 grain and 141 other distilleries, producing the "Geneva" or Dutch gin (Hollands). The yeast and the grain refuse of the distilleries form an article of export. Population (1900), 27,081.

Schimmel, Hendrik Jan (1825– ——), Dutch poet and novelist, was born 30th June 1825, at 'S Graveland, in the province of North Holland, where his father was a notary and the burgomaster. From 1836 to 1842 young Schimmel served his apprenticeship in his father's office, and upon his death he was taken into the office of the agent of the Dutch Treasury in Amsterdam, exchanging the work in 1849 for a post with the Dutch Trading Company there. In 1863 he became a director of the Amsterdam Credit Association. His first volume of poems appeared in 1852; but it is as a writer of historical dramas in blank verse, and one of the regenerators of the Dutch stage, that his literary position was made. His finest production is his *Struensee* (1868), which was preceded by *Napoleon Bonaparte* (1851) and *Juffrouw Serklaas* ("Mrs Serklaas," 1857). Among his other dramatic works may be mentioned *Joan Woutersz* (a drama, 1847), *Twee Tudors* ("Two Tudors," 1847), *Gondelbald* (1848), *Schuld en Boete* ("Guilt and Retribution," a drama, 1852), *Het Kind van Staat* ("The State Child," a dramatic fragment, 1859); *Zege na Strijd* ("Struggle and Triumph," a drama, 1878). Schimmel's renderings of Casimir de la Vigne's *Louis XI.*, Geibel's *Sophonisbe*, and Ponsard's *Lucrèce* are also still acted in the Netherlands. His novels are distinguished by their vigorous style and able characterization. The earlier, better-known ones betray the writer's English proclivities. The plots of *Mary Hollis* (1860, 3 vols.; English translation, London 1872, under the title of "Mary Hollis, a Romance of the Days of Charles II. and William, Prince of Orange," 3 vols.) and of *Mylady Carlisle* (1864, 4 vols.) are laid in England, whereas those of his *Sinjeur Semeyns* (1875, 3 vols.), a powerful picture of the terrible year 1672, and of *De Kapitein van de Lijfgarde* (1888, 3 vols.; English adaptation, 1896, under the title of "The Lifeguardsman," 1 vol.), a continuation of "Master Semeyns," are almost entirely centred in the Holland of those stirring days. He had many points of style and manner in common with Madame Bosboom-Toussaint, though both remained highly original in their treatment. Both exhausted their foreign themes and heroes, and finally reverted to essentially national subjects. To the earlier romances of Schimmel belong: *Bonaparte en zyn Tyd* ("Bonaparte and his Time," 1853), *De Eerste Dag eens Nieuwen Levens* ("The First Day of a New Life," 2 vols., 1855), *Sproken en Vertellingen* ("Legends and Tales," 1855), *Een Haagsche Joffer* ("A Hague Damsel," 1857), *De Vooravond der Revolutie* ("The Eve of the Revolution," 1866). Schimmel was an early collaborator of Potgieter on the *Gids* staff. His dramatic works appeared in a collected edition in 1885–86 at Amsterdam (3 vols.), followed by a complete and popular issue of his novels (Schiedam, 1892).

Schizomycetes. See Bacteriology.

Schlan (Czech, *Slaný*), the chief town of a district in Bohemia, Austria, about 40 miles north-west of Prague,

on the railway between the latter town and Brüx. There are extensive coal-fields and important iron, metal, and machine industries, together with the manufacture of chemicals and corn-milling. Population (1890), 9115; (1900), 9494, Czechs.

Schleiz, a town of Germany, second capital of the principality of Reuss the Younger, 20 miles by rail west by north of Plauen (in Saxony). Here are two royal residences, an old church, with the burial vaults of the reigning princes, a deaf and dumb asylum, teachers' seminary, wood-carving school, and various small industries (toys, belts, &c.). Population (1900), 5331.

Schleswig, a town of Prussia, capital of the province of Schleswig-Holstein, 29 miles north-west of Kiel. In 1894 the tower of the cathedral was carried up to 368 ft. The town possesses provincial lunatic and deaf and dumb asylums, and numerous modern monuments to local celebrities. There are tanneries, breweries, flour and saw-mills. Population (1895), 17,253; (1900), 17,909.

Schleswig-Holstein, the most north-westerly province of Prussia, with an area of 7337 square miles, and population (1890), 1,219,523; (1900), 1,387,587, of whom 701,583 were males and 686,004 females; the density being 189 inhabitants to the square mile. The population of the northern circles is still predominantly Danish; the total Danish population of the province being (in 1890) 134,064, as compared with 144,400 at the date of the conquest in 1864. In the circle of Hadersleben 88 per cent. of the population are Danes, in circle Sonderburg 85 per cent., in Apenrade 82 per cent., in Tondern 49 per cent. In these four circles 83·5 per cent. of the children attending school in 1891 spoke Danish as their mother tongue, and only 11·4 per cent. spoke German; whilst 5·1 per cent. spoke both languages. The live stock in 1900 included 897,615 cattle, 611,003 pigs, 235,469 sheep, and 184,658 horses. The sugar factories in 1900 produced 5800 tons of sugar; the breweries, 35,128,200 gallons of beer; and the distilleries, 933,100 gallons of pure alcohol. In 1900 the province owned a mercantile fleet of 770 sea-going vessels of 182,797 tons. The principal ports are Altona, Kiel, Flensburg, Neumühlen, Sonderburg, Wyck, Tönning, and Heligoland. In 1892 Dr Eugen Traeger called attention[1] to the perilous condition of the smaller of the North Frisian Islands, called *halligen;* and in 1896 measures were taken to protect them against the encroachment of the North Sea by warping them (*e.g.*, Oland and Langenes) together, and binding them in the same way to the mainland. For this purpose the Prussian Government voted a sum of £66,000 (see *Globus*, 1896, pp. 290–293). Since 1872 an area of 4000 acres has been reclaimed from the sea in South Dithmarsh, at the south-western extremity of the province, and additional areas were enclosed in 1900 and subsequent years. Altogether 16,000 acres were enclosed between 1785 and 1899.

Schliemann, Heinrich (1822–1890), known to the general world for his archæological discoveries at Hissarlik and Mycenæ, and held in special honour by scholars as the first who let in clear light upon the prehistoric civilization of the Greek lands, was born on 6th January 1822 at Neu Buckow, in Mecklenburg-Schwerin, the son of a poor pastor. He has stated in his autobiography that through all his early years of struggle, when he was successively grocer's apprentice at Fürstenberg, cabin-boy on the *Dorothea* bound for Venezuela, and, after her wreck, office attendant and then book-keeper in Amsterdam, he nourished a passion for the Homeric story and an ambition to become a great linguist. In the end, thanks to an unusually powerful memory and a determined energy, which would have made him remarkable in any line of life, he acquired a knowledge of seven or eight tongues besides his own, including ancient and modern Greek. The foundation of his fortune was laid by the house of B. H. Schröder of Amsterdam, which in 1846 sent him to St Petersburg, where he established a business of his own and embarked in the indigo trade. He made a fortune at the time of the Crimean war, partly as a military contractor. Being accidentally present in California, when made a state of the Union in 1850, he became and remained an American citizen. After travels in Greece, Tunis, India, China, and Japan, and writing a short sketch of the last two countries, he took his large fortune to Greece in 1868, and proceeded to visit Homeric sites. In an ensuing book—*Ithaka, der Peloponnes, und Troja*—he propounded two theories which he was destined eventually to test in practice, viz., that Hissarlik, not Bunarbashi, was the site of Troy, and that the Atreid graves, seen by Pausanias at Mycenæ, lay within the citadel wall. Two years later he took up Mr Calvert's work on the former site, and, convinced that Troy must be on the lowest level, hewed his way down, regardless of the upper strata, wherein lay unseen the remains of which he was really in search. By 1873 he had laid bare considerable fortifications and other remains of a burnt city of very great antiquity, and discovered a treasure of gold jewellery. We now know this city to have belonged to the middle pre-Mycenæan period, long prior to the generation of Homer's Achæans; but Schliemann far and wide proclaimed it "Troy," and was backed by Mr Gladstone and a large part of the European public. Trying to resume his work amid universal attention in February 1874, he found himself inhibited by the Ottoman Government, whose allotted share of the gold treasure had not been satisfactory, and it was not till April 1876 that he obtained a *firman*. During the delay he issued his *Troy and its Remains* (1875), and betook himself to Mycenæ, the other object of his early plans. There in August 1876 he began work in the Dome-tombs and by the Lion Gate, and opened a large pit just within the citadel. The famous double ring of slabs and certain stone reliefs came to light. Schliemann, thinking it was only a platform levelled as a place of Achæan assembly, paused, and did not resume till November. Then, resolved to explore to the rock, he cleared away some three feet more of earth and stones, and lighted on the five shaft graves which have placed him first among fortunate excavators. A sixth grave was found immediately after his departure. The immense treasure of gold, silver, bronze, fine stone and ivory objects, which was buried with the sixteen corpses in this circle, is worth intrinsically more than any treasure trove known to have been found in any land, and it revealed once for all the character of a great civilization preceding the Hellenic. The find was deposited at Athens, and gradually cleaned and arranged in the Polytechnic; and the discoverer, publishing his *Mycenæ* in English in 1877, had his full share of honours and fame. He had now settled in Athens. There he married a Greek lady, and there successively he built two splendid houses, which became centres of Athenian society. In 1878 he dug in Ithaca, but unsuccessfully, and in the same year and the following resumed work at Hissarlik, and summed up his results in a discursive memoir, *Ilios*, upon which a sequel, *Troja*, issued in 1884,

[1] In *Die Halligen der Nordsee* (Stuttgart, 1892), being part of vol. vi. of A. Kirchhoff's *Forschungen zur Deutschen Landes- und Volks-kunde;* also *Globus*, vol. lxxviii. (1900), No. 15; and Christian Jensen, *Vom Dünenstrand der Nordsee und vom Wattenmeer* (Schleswig, 1901).

after Wilhelm Dörpfeld, associated in 1882, had introduced some archæological method into the explorations, was a considerable improvement. In 1880 and 1881 Schliemann cleared out the ruined dome-tomb of Orchomenus, finding little except remains of its beautiful ceiling; and in 1885, with Dörpfeld, he laid bare the upper stratum on the rock of Tiryns, presenting scholars with a complete ground plan of a Mycenæan palace. This was his last fortunate excavation. While Tsountas, for the Greek Archæological Society, picked up his work at Mycenæ in 1886, and gradually cleared the Acropolis, with notable results, Schliemann tried for traces of the Cæsareum at Alexandria, of the Palace of Minos at Knossos, in Crete, and of the Aphrodite temple at Cythera (1888); but he was not successful, meeting in the two former enterprises with a local opposition which his wealth was unable to bear down. In 1889 he entertained at Hissarlik a committee of archæological experts, deputed to examine Bötticher's absurd contention that the ruins represented not a city, but a cremation necropolis; and he was contemplating a new and more extensive campaign on the same site when, in December 1890, he was seized at Naples with an illness which ended fatally on the morning of Christmas Day. His great wealth was left mainly to the two families that he had in Russia and Greece; but a sum was reserved for Hissarlik, where Dörpfeld in 1891 and 1892, by clearing away the débris of the former excavations, exposed the great walls of the sixth stratum which Schliemann had called Lydian, and proved their synchronism with Mycenæ, and identity with Mycenæan remains; that is to say, with Homer's Troy, if Troy ever was.

Schliemann was on several occasions in England, in 1883 to receive honours from the great universities, and in 1886 to confute, at a special gathering of the Hellenic Society, the assertion of Stillman and Penrose that the Tirynthian palace was posterior to the Christian era. Nowhere was he better appreciated, and most of his books were first issued in English. (D. G. H.)

Schlüsselburg, a district town and fortress of Russia, in the government and 40 miles east of the city of St Petersburg, at the issue of the Neva from Lake Ladoga, situated on low ground surrounded by marshes. It was founded in 1323 by the Novgorodians, and though afterwards lost by Russia, was reconquered by Peter the First. It has a fortress, built on an island in the Neva, which is now used as a political prison. Population (1897), 5285.

Schmerling, Anton von (1805–1893), Austrian statesman, was born on 23rd August 1805 at Vienna, where his father held a high position on the judicial side of the civil service. After studying law at the university of Vienna, in 1829 he entered the public service, and during the next eighteen years was constantly occupied, chiefly in Lower Austria. In 1847, as a member of the lesser nobility, he entered the Estates of Lower Austria, with which he had already had some connexion in his official work, and took an active part in the Liberal movement for administrative and constitutional reform of which they were the centre. On the outbreak of the revolution in Vienna in March 1848, when the mob broke into the Assembly, Schmerling was one of the deputation which carried to the palace the demands of the people, and during the next few days he was much occupied in organizing the newly formed National Guard. At the end of the month he was sent by the ministry to Frankfort as one of the men of "public confidence." For the next year he was one of the leading figures in the city which was the centre of the German revolution. He soon succeeded Count Colleredo as president of the Diet, and in this capacity officially transferred to the Archduke John, the "administrator" of the country, the powers of the Diet. For this he was violently attacked in the Assembly by the extreme Radicals; but on this and other occasions (he had himself been elected to the Assembly) he defended moderate and constitutional principles, all the more effectively because he depended not on eloquence but on a recognition of what has been called the "irony of facts"—to which the Assembly as a whole was so blind. He was the first and the most influential member of the ministry which the administrator formed; he held the ministry of the interior and, later, also that of foreign affairs, and it was almost entirely due to him that at least for a short time this phantom government maintained some appearance of power and dignity. A defeat in the Assembly when he defended the armistice of Malmö led to his resignation; but he was immediately called to office again, with practically dictatorial power, in order to quell the revolt which broke out in Frankfort on 18th September. His courage and resolution averted what nearly became a terrible catastrophe. It was his hope to establish in Germany the supremacy of a Liberal and reformed Austria. This brought him into opposition to the party of Prussian supremacy; and when they attained a majority, he resigned, and was succeeded by Gagern. He remained at Frankfort, holding the post of Austrian envoy, and was the leader of the so-called Great German party. This position he resigned when the dissolution of the Austrian Parliament showed that the forces of reaction had conquered at Vienna, and shattered all hopes of Austria attaining the position he had hoped for her. After the abortive election of the king of Prussia to be emperor, he, with the other Austrians, left Frankfort. He was at the time one of the most unpopular men in Germany, but his conduct in the extremely difficult position he had held for the last year caused him to be regarded as the most promising of the younger generation of Austrian officials. On his return to Vienna he became minister of justice, and the reforms which he carried out added to his reputation. His popularity among all Liberals was increased by his resignation in 1851, as a protest against the failure of the Government to establish the constitution they had promised. During the next few years he was judge of the supreme court of appeal. When his forecast was fulfilled and the system of absolutism broke down, it was natural that he should be summoned to power. He became minister in January 1862, and his first act was the publication of the celebrated constitution by which the whole of the empire was to be organized as a single state with a parliamentary government. The experiment failed, chiefly because of the opposition of the Croatians and Magyars, whom he bitterly offended by his celebrated saying that "Hungary could wait." Faults of manner, natural in a man whose life had been spent as an official and a judge, prevented him from keeping together the German Liberals as a strong and united party; he was opposed by a powerful faction at court, and by the Clerical leaders. After the first few months the emperor gave him only a very lukewarm support; and with his retirement in 1865 the attempt to carry out the ideals of Joseph II. to Germanize while he liberalized the whole of the empire, and to compel Hungarians, Poles, Czechs, and Croatians to accept a system in which the government of the whole should be carried on by a German-speaking Parliament and bureaucracy, failed. The constitution of 1862, though suspended on Schmerling's fall, was still regarded as legally valid for the cis-Leithan territories, and is the basis on which the present constitution for half the empire was framed. Schmerling, therefore, not only in

the ideas which he upheld, but in the practical working out of them, was one of the most influential Austrian statesmen of the 19th century. On his retirement he returned to his judicial duties; in 1867 he was made life-member of the Upper House in the Reichsrath, of which he became vice-president, and in 1871 president. This post he laid down in 1879, and came forward as leader of the Liberal German opposition to the administration of Count Taaffe. In 1891 he retired from public life, and died at Vienna on the 23rd of May 1893.

Schmerling married, in 1835, Pauline, daughter of Field-Marshal-Lieutenant Baron von Koudelka. Frau von Schmerling, who was distinguished by literary and artistic abilities, at that time rare in the Austrian capital, died in 1840, leaving two daughters.

W. HE.)

Schneidemühl, a town of Prussia, province of Posen, 60 miles by rail north of Posen. It has three churches, a synagogue, and a deaf and dumb asylum. Considerable damage was done to the town in 1893 by a violent overflow of water from a deep artesian well. Machinery is made here. Population (1885), 12,406; (1900), 19,656.

Schofield, John McAllister (1831– ——), American soldier, was born in Chautauqua county, N.Y., 29th September 1831, and graduated at the U.S. Military Academy in 1853. He was assistant professor at West Point, 1855–60, and while on leave (1860–61) filled the chair of physics at Washington University, St Louis. When the Civil War broke out he became major in a Missouri volunteer regiment, and served on General Lyon's staff until the death of that brilliant officer; was brigadier-general of volunteers, November 1861, and performed various duties in Missouri (1861–64), rising to major-general, 29th November 1862. In February 1864 he commanded the Missouri department; and, transferred in April to General Sherman, his corps remained with General Thomas when Sherman left Atlanta for the sea. He won the battle of Franklin, 30th November 1864; fought again at Nashville, 15th December 1864, and was promoted to brigadier-general in the regular army. Ordered next to North Carolina, he occupied Wilmington, 22nd February 1865; and joined Sherman at Goldsboro in March for the final capture of Johnston's army. After the war he served in various departments: was secretary of war *ad interim*, June 1868–March 1869; and then appointed major-general. He commanded the United States army, 1888–95; was made lieutenant-general, February 1895, that grade having been revived; and retired in September of that year.

Schönbach, a small town in the government district of Eger, in North Bohemia. It is remarkable from the circumstance that it is almost exclusively devoted to the manufacture of musical instruments. It produces annually nearly 100,000 violins and violoncellos, 14,000 guitars, &c., and 7000 wind instruments, in addition to accordeons, harmonicas, &c. Population (1890), 3639; (1900), 4157.

Schönberg, or MÄHRISCH-SCHÖNBERG (Czech, *Šumperk*), the chief town of a district in Moravia, on the river Tess, a tributary of the March. It has an important textile industry, including linen, silk, and cotton goods. Population (1890), 10,493; (1900), 11,636, almost exclusively German and Catholic.

Schönfeld, Eduard (1828–1891), German astronomer, was born at Hildburghausen, in the duchy of Meiningen, on the 22nd December 1828. He had a distinguished career at the gymnasium of his native town, and on leaving desired to devote himself to astronomy, but abandoned the idea in deference to his father's wishes. He went first to Hanover, and afterwards to Cassel to study architecture, for which he seems to have had but little inclination. In 1849 we find him studying chemistry under Bunsen at Marburg, where his love for astronomy, never quite cooled, was revived by Gerling's lectures. In 1851 he visited the Bonn Observatory, and, expressing to Argelander an earnest wish to study astronomy under him, was received with open arms. In 1853 he was appointed assistant, and in the following year won a distinguished doctor's degree with his treatise *Nova Elementa Thetidis.* At Bonn he took an important part in preparing the *Durchmusterung* of the northern heavens. He was indefatigable as an observer and critical in discussing results, thinking no labour too great in the pursuit of his favourite study. He took up vigorously the investigation of the light-changes in variable stars, devoting to this work nights which, on account of moonlight, were unsuitable for zone observations. The results of these researches are published in the *Sitz. Berich. Wien. Akad.* vol. xlii. For a short time he was a *privat-docent* at Bonn, but in 1859 he was appointed director of the Mannheim Observatory. The instrumental equipment of that observatory was somewhat antiquated, his largest telescope being a small refractor of 73 lines aperture, but he selected a line of work to suit the instruments at his disposal, observing nebulæ and variable stars and keeping a watch on comets and new planets. The results of his observations of nebulæ are contained in two catalogues published in the *Astronomische Beobachtungen der Grossherzoglichen Sternwarte zu Mannheim*, 1st and 2nd parts (1862 and 1875), and those of his variable star obvervations appeared in the *Jahresberichte des Mannheimer Vereins für Naturkunde*, Nos. 32 and 39 (1866 and 1875). On the death of Argelander, which occurred on 17th February 1875, Schönfeld was appointed to succeed him as director of the Bonn Observatory, and soon after his appointment he began his last and greatest piece of work, the extension, on Argelander's plan, of the survey of the heavens down to 23° of south declination. The experience gained on the northern survey under Argelander's direction enabled Schönfeld to introduce some improvements in the methods employed, which increased the accuracy and added considerably to the value of this work, which was practically accomplished in March 1881, some revision only remaining to be done. These zone observations afforded 363,932 separate places of stars, and form the groundwork of the catalogue of 133,659 stars between 2° and 23° south declination, which was published in 1886 as the eighth volume of the Bonn observations.

Schönfeld was a member of the Astronomische Gesellschaft from its foundation in 1863, being a member of Council up to 1869, and in 1875 becoming editor of its publications and secretary in conjunction with Winnecke. In the latter capacity he was brought into friendly relations with many fellow-workers in his own subject. In 1878 he was elected a Foreign Associate of the Royal Astronomical Society. In 1887, as delegate of the Prussian Government, he attended the first Paris Congress for the Photographic Survey of the Heavens. In 1864 he was present at the celebration of the 25th anniversary of the Pulkowa Observatory, and again, in 1889, he was sent, on behalf of the Prussian minister of education, to convey the congratulations of German astronomers on the occasion of the jubilee of that observatory. Illness prevented him from attending the meeting of the Astronomische Gesellschaft in the same year at Brussels, whither the Watson

medal had been sent to him from America. He died, after a long and painful illness, on 1st May 1891. (A. A. R*.)

Schöningen, a town of Germany, duchy of Brunswick, 29 miles by rail west of Magdeburg. It has a salt-mine and brine spring, lignite mines, and chemical and iron-works. The place is mentioned in the year 747, and still possesses remains of a ducal castle, 17th-century wooden houses, and a 15th-century church. Population (1885), 6921; (1900), 8460.

Schools of Art. See ART-TEACHING.

SCHOOLS OF PAINTING.

BRITISH.

At the beginning of the last quarter of the 19th century British art was held to be in a vigorous and authoritative position. During the years immediately preceding, it had been developing with regularity and had displayed a vitality which seemed to be full of promise. It was supported by a large array of capable workers; it had gained the widest recognition from the public; and it was curiously free from those internal conflicts which diminish the strength of an appeal for popular appreciation. There were then few sharp divergences or subdivisions of an important kind. The leadership of the Royal Academy was generally conceded, and its relations with the mass of outside artists were little wanting in cordiality. One of the chief reasons for this understanding was that at this time an almost unprecedented approval was enjoyed by nearly all classes of painters. Picture-collecting had become a general fashion, and even the youngest workers received encouragement directly they gave evidence of a reasonable share of capacity. The demand was equal to the supply; and though the number of men who were adopting the artistic profession was rapidly increasing, there seemed little danger of over-production. Pictorial art had established upon all sorts of people a hold too strong, as it seemed, to be affected by change of fashion. All pointed in the direction of a permanent prosperity.

Subsequent events provided a curious commentary on the anticipations which were reasonable enough in 1875. That year is now seen to have been, not the beginning of an era of unexampled success for British pictorial art, but rather the culminating point of preceding activity. During the period which has succeeded we have witnessed a rapid decline in the popular interest in picture-painting and a marked alteration in the conditions under which artists have had to work. In the place of the former sympathy between the public and the producers, there grew up something which almost approached indifference to their best and sincerest efforts. Simultaneously there developed a great amount of internal dissension and of antagonism between different sections of the art community. As an effect of these two causes, a new set of circumstances came into existence, and the aspect of the British school underwent a radical change. Many art workers found other ways of using their energies. The slackening of the popular demand inclined them to experiment, and to test forms of practice which formerly were not accorded serious attention, and it led to the formation of detached hostile groups of artists always ready to contend over details of technical procedure. Restlessness became the dominant characteristic of the British school, along with some intolerance of the popular lack of sympathy.

The first sign of the coming change appeared very soon after 1875. The right of the Royal Academy to define and direct the policy of the British school was disputed in 1877, when the Grosvenor Gallery was started "with the intention of giving special advantages of exhibition to artists of established reputation, some of whom have previously been imperfectly known to the public." This exhibition gallery was designed not so much as a rival to the Academy, as to provide a place where could be collected the works of those men who did not care to make their appeal to the public through the medium of a large and heterogeneous exhibition. As a rallying place for the few unusual painters, standing apart from their fellows in conviction and method, it had good reason for existence; and that it was not regarded at Burlington House as a rival was proved by the fact that among the contributors to the first exhibition were included Sir Francis Grant, the President of the Royal Academy, and such artists as Leighton, Millais, G. F. Watts, Alma-Tadema, G. D. Leslie, and E. J. Poynter, who were at the time Academicians or Associates. With them, however, appeared such men as Burne-Jones, Holman Hunt, Walter Crane, W. B. Richmond, and J. McN. Whistler, who had not heretofore obtained the publicity to which they were entitled by the exceptional quality and intention of their work. There was doubtless some suggestion that the Academy was not keeping touch with the more important art movements, for shortly after the opening of the Grosvenor Gallery there began that attack upon the official art leaders which has been one of the most noteworthy incidents in recent art history in Great Britain. The initial stage of this conflict ended about 1886, when the vehemence of the attack had been weakened, partly by the withdrawal of some of the more prominent "outsiders," who had meanwhile been elected into the Academy, and partly by the formation of smaller societies, which afforded the more "advanced" of the younger men the opportunities which they desired for the exposition of their views. In a modified form, however, the antagonism between the Academy and the outsiders has continued. The various protesting art associations continue to work in most matters independently of one another, with the common belief that the dominant influence of Burlington House is not exercised entirely as it should be for the promotion of the best interests of British art, and that it maintains tradition against the development of individualism and a "new style."

The Grosvenor Gallery and the Academy.

Meanwhile the policy of the Academy (*q.v.*) has undergone some little change. As things have turned out, there is evidence that the agitation in all branches of art effort has not been entirely without result even inside Burlington House. Some of the older academic views have been modified, and changes seriously discussed, which formerly would have been rejected as opposed to all the traditions of the society. Its calmness under attack, and its ostentatious disregard of the demands made upon it by the younger and more strenuous outsiders, have veiled a great deal of shrewd observation of passing events. It may be said that the Academy has known when to break up an organization in which it recognized a possible source of danger, by selecting the ablest leaders of the opposition to fill vacancies in its own ranks; it has given places on its walls to the works of those reformers who were not unwilling to be represented in the annual exhibitions; and it has, without seeming to yield to clamour, responded

perceptibly to the pressure of professional opinion. In so doing, though it has not checked the progress of the changing fashion by which the popular liking for pictorial art has been diverted into other channels, it has kept its hold upon the public, and has not to any appreciable extent weakened its position of authority.

Changed conditions of British art.

It is doubtful whether a more definite participation by the Academy in the controversies of the period would have been of any use as a means of prolonging the former good relations between artists and the collectors of works of art. The change is the result of something more than the failure of one art society to fulfil its entire mission. The steady falling off in the demand for modern pictures has been due to a combination of causes which have been powerful enough to alter nearly all the conditions under which British painters have to work. For example, the older collectors, who had for some years anterior to 1875 bought up eagerly most of the more important canvases which came within their reach, could find no more room in their galleries for further additions; again, artists, with the idea of profiting to the utmost by the keenness of the competition among the buyers, had forced up their prices to the highest limits. But the most active of all causes was that the younger generation of collectors did not show the same inclination that had swayed their predecessors to limit their attention to modern pictorial art. They turned more and more from pictures to other forms of artistic effort. They built themselves houses in which the possibility of hanging large canvases was not contemplated, and they began to call upon the craftsman and the decorator to supply them with what was necessary for the adornment of their homes. At first this modification in the popular taste was scarcely perceptible, but with every successive year it became more marked in its effect.

Latterly more money has been spent by one class of collectors upon pictures than was available even in the best of the times which have passed away; but this lavish expenditure has been devoted not to the acquisition of works by modern men, but to the purchase of examples of the old masters. Herein may often be recognized the wish to become possessed of objects which have a fictitious value in consequence of their rarity, or which are "sound investments." Evidence of the existence of this spirit among collectors is seen in the prevailing eagerness to acquire works which inadequately represent some famous master, or are even ascribed to him on grounds not always credible. The productions of minor men, such as Henry Morland, who have never been ranked among the masters, receive an amount of attention which is quite out of proportion to what merits they possess, if only they can be proved to be scarce examples, or historically notorious. All this implies in the creed of the art patron a change which has necessarily reacted on living painters and on the conditions of their art production.

Portraiture.

These, then, are the conclusions to which we are led by a comparison of the movements which affected the British school between 1875 and 1902. To a wide appreciation of all types of pictorial art has succeeded a grudging and careless estimate of the value of the bulk of artistic endeavour. Only a few branches of production are still encouraged by anything approaching an efficient demand. Portraiture is the mainstay of the majority of the figure painters; it has never lost its popularity, and may be said to have maintained satisfactorily its hold upon all classes of society, for the desire to possess personal records is very general and is independent of any art fashion. It has persisted through all the changes of view which have been increasingly active in recent years. In 1902 the hope of any marked revival in other branches of picture-painting might well seem somewhat remote. Episodical art, illustrating sentimental motives or incidents with some touch of dramatic action, remained popular, because it had some degree of literary interest; but imaginative works and pictures which had been produced chiefly as expressions of an original regard for nature, or of some unusual conviction about technical details, found comparatively few admirers. The one hopeful sign was that the designers and the workers in the decorative arts were finding opportunities which formerly were denied to them. They had more scope for the display of their ingenuity and more inducement to exercise their powers of invention. It was, indeed, not unreasonable to assume that the first stages were being witnessed in the development of a vigorous and influential school of design which in the near future would evolve work of originality and excellence. Already British designers had gained a hearing abroad, and had earned emphatic approval in countries where a sound decorative tradition had been maintained for centuries; so that there seemed to be the germ of vitality in a movement which had scarcely had time as yet to give more than a hint of its possibilities.

Episodical art.

Decorative art.

Wane of Pre-Raphaelitism and rise of French influence.

Not only in matters affecting the relations between artists and the public has the period been full of change, but also in the convictions of the workers themselves, and in some surprising educational departures. The one dominant influence, that of the Pre-Raphaelite Brotherhood, which in the 'fifties altered the whole complexion of British art, had begun to wane early in the 'seventies, and it was rapidly being replaced by another scarcely less distinctive. The younger generation of artists had wearied, even before 1875, of the Pre-Raphaelite precision, and were impatient of the restrictions imposed upon their freedom of technical expression by a method of practice which required laborious application and unquestioning obedience to a rather formal code of regulations. They yearned for greater freedom and boldness, and for a better chance of asserting their individual capacities. So they gave way to a strong reaction against the creed of their immediate predecessors, and cut themselves deliberately adrift.

With the craving of young artists for new forms of technique came also the idea that the "old-master traditions" were opposed to the exact interpretation of nature, and were based too much upon convention to be adapted for the needs of men who believed that absolute realism was the one thing worth aiming at in picture-production. So Paris became the educational centre instead of Rome. There was to British students, dissatisfied with the half-hearted and imperfect systems of teaching with which they were tantalized at home, a peculiarly exhilarating atmosphere in the French studios—an amount of enthusiasm and a love of art for its own sake without parallel elsewhere. They saw in operation principles which led by the right sequence of stages to sure and certain results. In these circumstances they allowed their sympathies with French methods to become rather exaggerated, and were somewhat reckless in their adoption of both the good and bad qualities of so attractive a school.

At first the results of this breaking-away from all the older educational customs were not wholly satisfactory. British students came back from France better craftsmen, stronger and sounder draughtsmen, more skilful manipulators, and with an infinitely more correct appreciation of refinements of tone-management than they had ever possessed before; but they brought back also a disproportionate amount of French mannerism and a number

of affectations which sat awkwardly upon them. In the first flush of their conversion they went farther than was wise or necessary, for they changed their motives as well as their methods. The quietness of subject and reserve of manner which had been hitherto eminently characteristic of the British school were abandoned for foreign sensationalism and exaggeration of effect. An affectation of extreme vivacity, a liking for theatrical suggestion, even an inclination towards coarse presentation of unpleasant incidents from modern life—all of which could be found in the paintings of the French artists who were then recognized as leaders—must be noted as importations from the Paris studios. They were the source of a distinct degeneration in the artistic taste, and they introduced into British pictorial practice certain unnatural tendencies. Scarcely less evident was the depreciation in the instinctive colour-sense of British painters, which was brought about by the adoption of the French habit of regarding strict accuracy of tone-relation as the one important thing to aim at. Before this there had been a preference for rich and sumptuous harmonies and for chromatic effects which were rather compromises with, than exact renderings of, nature; but as the foreign influence grew more active, these pleasant adaptations, inspired by a sensuous love of colour for its own sake, were abandoned for more scientific statements. The colder and cruder tone-studies of the modern Frenchmen became the models upon which the younger artists based themselves, and the standards against which they measured their own success. "Actuality" was gained, but much of the poetry, the delicacy, and the subtle charm which distinguished British colourists in the 'fifties was lost.

Danger of the French influence.

For some while there was a danger that the art of Great Britain might become hybrid, with the French strain predominating. So many students had succumbed to the fascination of a system of training which seemed to supply them with a perfect equipment on all points, that they were inclined to despise not only the educational methods of their own country, but also the inherent characteristics of British taste. The result was that the exhibitions were full of pictures which presented English people and English landscape in a purely arbitrary and artificial manner, strictly in accordance with a French convention which was out of sympathy with British instincts, and indeed, with British facts. Ultimately a discreet middle course was found between the extreme application of the science of the French art schools and the comparative irresponsibility in technical matters which had so long existed in the British Isles. In the careers of men like Stanhope Forbes, H. S. Tuke, Frank Bramley, and other prominent members of the school, many illustrations are provided of the way in which this readjustment has been effected. Their pictures, if taken in a sufficiently long sequence, summarize instructively the course of the movement which has been so active since 1875. They prove how valuable the interposition of France has been in the matter of artistic education, and how much Englishmen have improved in their understanding of the technique of painting.

Weakening of the French influence.

One noteworthy outcome of the triumph of common sense over fanaticism must be mentioned. Now that the exact relation which French teaching should bear to British thought has been adjusted, an inclination to revive the more typical of the forms of pictorial expression which have had their vogue in the past is becoming increasingly evident. Picturesque domesticity is taking the place of theatrical sensation, the desire to select and represent what is more than ordinarily beautiful is ousting the former preference for what was brutal and ugly, the effort to please is once again stronger than the intention to surprise or shock the art lover. Even the Pre-Raphaelite theories and practices are being reconstructed, and quite a considerable group of young artists is springing up who are avowed believers in the principles which were advocated so strenuously in 1850.

Groups within the British school.

To French intervention can be ascribed the rise and progress of several movements which have had results of more than ordinary moment. There was a few years ago much banding together of men who believed strongly in the importance of asserting plainly their belief in the doctrines to which they had been converted abroad; and as a consequence of this desire for an offensive and defensive association, many detached groups were formed within the boundaries of the British school. Each of these groups had some peculiar tenet which it sought to advocate, and each one had a small orbit of its own in which it revolved, without concerning itself much about what might be going on outside. Roughly, there were three classes into which British artists could then be divided. One included those men who were in the main French in sympathy and manner; another consisted of those who were not insensible to the value of the foreign training, but yet did not wish to surrender entirely their faith in the British tradition; and the third, and smallest, was made up of a few individuals who were independent of all assistance from without, and had sufficient force of character to ignore what was going on in the art world. In this third class there was practically no common point of view: each man chose his own direction and followed it as he thought best, and each one was prepared to stand or fall by the opinion which he had formed as to the true function of the painter. Necessarily, in such a gathering there were several notable personalities who may fairly be reckoned among the best of English modern masters.

The Newlyn school.

Perhaps the most conspicuous of the groups was the collection of painters who established themselves in the Cornish village of Newlyn. This group—"The Newlyn School," as it was called—was afterwards much modified, and many of its most cherished beliefs were considerably altered. In its beginning it was essentially French in atmosphere, and advocated not only strict adherence to realism in choice and treatment of subject, but also the subordination of colour to tone-gradation, and the observance of certain technical details, such as the exclusive use of flat brushes and the laying on of pigments in square touches. The colony was formed, as it were, in stages; and as the school is to be reckoned in the future history of the British school, the order in which the adherents arrived may here be set on record. Edwin Harris came first, and was joined by Walter Langley. Then, in the following order, came Ralph Todd, L. Suthers, Fred Hall, Frank Bramley, and T. C. Gotch, and Percy Craft and Stanhope Forbes together. H. Detmold and Chevallier Tayler next arrived; then Miss Elizabeth Armstrong (Mrs. Stanhope Forbes), F. Bourdillon, W. Fortescue, and Norman Garstin. Ayerst Ingram, H. S. Tuke, H. Martin, and F. Millard were later visitors. The earlier leaders of this school were said to have chosen Newlyn as their working centre because the prevailing greyness in the atmosphere of the place facilitated their interpretation of subleties of tone. Almost the only one of the original set who in 1902 remained at Newlyn was Stanhope Forbes (b. 1857), who was trained at the Lambeth School and at the Royal Academy, and afterwards in Bonnat's studio in Paris. His best known pictures are "A Fish Sale on a Cornish Beach" (1885), "Soldiers and Sailors" (1891), "Forging the Anchor" (1892), and "The Smithy" (1895). He was elected an Associate of the Royal Academy in 1892. Frank Bramley (b. 1857) studied art in the Lincoln School of Art and at Antwerp. He gained much popularity by his pictures "A Hopeless Dawn" (1888), "For of such is the Kingdom of Heaven" (1891), and "After the Storm" (1896), and was elected an Associate in 1894. Of late years he has made a very definite departure from the technical methods which he followed in his earlier period. T. C. Gotch (b. 1854) had a varied art training; for he worked at the Slade School, then at Antwerp, and finally in Paris under Jean Paul Laurens. He did not long remain faithful to the Newlyn creed, but diverged about 1890 into

a kind of decorative symbolism, and subsequently devoted himself entirely to pictures of this type. The other men who must be ranked as supporters of the school adhered closely enough to the principles which were exemplified in the works of the leaders of the movement. They were faithful realists, sincere observers of the facts of the life with which they were brought in contact, and quite earnest in their efforts to paint what they saw, without modification or idealization. Their art was honest, but too material and uninspired to gain a permanent hold upon any but a small section of the public. The Newlyn school has ceased to be an association of artists sharing a common conviction or possessing a united aim. The name continues, but it is used now chiefly as the title of an art colony settled in the village, and including a varied assemblage of workers who have gathered there because the neighbourhood is rich in picturesque material. But Newlyn will always have a place in art history as the headquarters of a movement which proposed to effect a drastic reform in British art.

The Impressionist school. Another group which received its inspiration directly from France was the Impressionist school (see IMPRESSIONISM). This group never had any distinct organization like that of the French Société des Impressionistes, but among the members of it there was a general agreement on points of procedure. They based themselves, more or less, upon prominent French artists like Manet, Renoir, Pissarro, and Claude Monet, and owed not a little to the example of J. McN. Whistler, whose own art may be said to be in a great measure a product of Paris. One of the fundamental principles of their practice is the subdivision of colour masses into their component parts, and the rendering of gradated tints by the juxtaposition of touches of pure colour upon the canvas, rather than by attempting to match them by previously mixing them on the palette. In pictures so painted greater luminosity and more subtlety of aërial effects can be obtained. The works of the British Impressionists have been seen mostly in the exhibitions of the New English Art Club.

The New English Art Club. This society was founded in 1885 by a number of young artists who wished for facilities for exhibition which they felt were denied to them in the other galleries. It drew the greater number of its earlier supporters from the men who had been trained in foreign schools, and a complete list of the contributors to its exhibitions includes the names of many of the best known of the younger painters. It was the meeting-place of numerous groups which advocated one or other of the new creeds, for among its members or exhibitors can be counted P. Wilson Steer, Fred Brown, J. S. Sargent, Solomon J. Solomon, Stanhope Forbes, T. C. Gotch, Frank Bramley, Arthur Hacker, Francis Bate, Moffat Lindner, J. L. Henry, W. W. Russell, George Thomson, Arthur Tomson, Henry Tonks, C. W. Furse, R. Anning Bell, Walter Osborne, Laurence Housman, J. J. Shannon, W. L. Wyllie, H. S. Tuke, Maurice Greiffenhagen, G. P. Jacomb Hood, Alfred Parsons, Alfred East, J. Buxton Knight, C. H. Shannon, Mark Fisher, Walter Sickert, W. Strang, Frank Short, Edward Stott, Mortimer Menpes, Alfred Hartley, William Stott, J. R. Reid, Mouat Loudan, T. B. Kennington, H. Muhrman, A. D. Peppercorn, George Clausen, and J. McN. Whistler, and a number of the Scottish artists, like J. Lavery, J. Guthrie, George Henry, James Paterson, A. Roche, E. A. Walton, J. E. Christie, and E. A. Hornel. A number of the men who have been more or less actively identified with it have been elected members of the Royal Academy, so that it may fairly claim to have exercised a definite influence upon the tendencies of modern art. It has certainly done much to prove the extent of the foreign influence upon the British school, and it has summarized instructively the varieties of artistic practice and point of view which have been so noteworthy during recent years. That there has been latterly a change in the atmosphere of its exhibitions is due to the new conditions which prevail in the art world. It reflects the steadying of conviction and the reaction towards a more national style which are affecting British artists as a mass. It shows less the undiluted influence of France, and much more of that growing, or rather vaguely expressed, desire for individuality which suggests now that British painters recognize the futility of trying to transplant to their country a mode of thought unsuited to their innate convictions and at variance with their mental traditions and with their own temperament.

In its wider sense the Impressionist school may be said to include now all those students of nature who strive for the representation of broad effects rather than minute details, who look at the subject before them largely and comprehensively, and ignore all minor matters which would be likely to interfere with the simplicity of the pictorial rendering. To it can be assigned a number of artists who have never adopted, or have definitely abandoned, the prismatic analysis of colour advocated by the French Impressionists. These men are headed by J. McN. Whistler (*q.v.*), born in America in 1835, and trained in Paris under Gleyre. His pictures have always been remarkable for their beauty of colour combination, and for their sensitive management of subtleties of tone. They have gained for the artist a place among the chief modern executants, and have attracted to him a host of followers. Other notable painters who have places in the school are Mark Fisher, an American landscape painter who studied for a while in Gleyre's studio, one of the ablest interpreters in England of effects of sunlight and breezy atmosphere; A. D. Peppercorn, a pupil of Gérôme, who makes landscapes a medium for the expression of a dignified sense of design and a carefully simplified appreciation of contrasts of tone; and P. Wilson Steer, an artist who began as a follower of Monet, and has based upon his training in the École des Beaux Arts a style of his own, which he displays effectively in both landscapes and figure pictures. In its pure form Impressionism has not gained much hold upon British painters, but in a certain degree some of its principles have affected a great number of men who cannot be strictly considered as avowed believers in the teachings of the school.

Figure painters. Generally speaking, the very large class of artists who fell only to a limited extent under the spell of French teaching includes most of the figure and landscape men and practically the whole of the portrait painters. In all sections of the figure school individual workers of improved technical methods have appeared, but most of them have gradually lost their distinguishing peculiarities of manner, and have year by year assimilated themselves more closely to their less advanced brethren. The section in which their energetic propagandism has been most effective is certainly that of imaginative composition. A definite mark has been made there by men like S. J. Solomon (b. 1860), trained at the Royal Academy Schools, the Munich Academy, and the École des Beaux Arts in Paris, elected an Associate of the Academy in 1896, and widely known by such pictures as "Samson" (1887), "The Judgment of Paris" (1890), and the "Birth of Love" (1895); and Arthur Hacker (b. 1858), educated at the Academy and in Bonnat's studio, elected an Associate in 1894, and the painter of a considerable series of semi-historical and symbolical canvases. They have exercised a considerable influence upon their contemporaries, and have introduced some new elements into the later practice of the school. But at the same time admirably effective work has been done in this section and others by many painters who have kept much more closely in touch with the older type of æsthetic belief, and have not associated themselves openly with any of the newer movements. Among the more prominent of these figure painters there are, or have been, some excellent craftsmen, whose contributions to the record of native British art can be accepted as full of permanent interest. In the school of historical incident good work was done by Sir John Gilbert (1817–1897), a robust and ingenious illustrator of romantic motives, with a never-failing capacity for picturesque invention; John Pettie (1839–1893), a fine colourist and a clever manipulator, whose scenes from the life of past centuries were full of rare vitality; P. H. Calderon (1833–1898), a graceful and sincere artist not wanting in originality; and H. Stacy Marks (1829–1898), who treated mediæval motives with a touch of real humour. Besides these, there are Sir J. D. Linton (b. 1840), who has produced many fine compositions in oil and water colours; Frank Dicksee (b. 1853), elected an Associate of the Royal Academy in 1881 and an Academician in 1891, who has gained wide popularity by pictures in which romance and sentiment are combined in equal proportions; A. C. Gow (b. 1848), a member of the Academy since 1881, whose "Cromwell at Dunbar" (1886), "Flight of James II. after the Battle of the Boyne" (1888), and "Crossing the Bidassoa" (1896) may be noted as typical examples of his performance; J. Seymour Lucas (b. 1849), trained at the Royal Academy Schools, elected an Associate in 1886 and an Academician in 1898, and a brilliant painter of what may be called the by-play of history; W. Dendy Sadler (b. 1854), trained partly in London and partly at Düsseldorf, and well known by his quaintly humorous renderings of the lighter side of life in the olden times; G. H. Boughton (born in England, but educated first in America and afterwards in Paris), elected an Associate in 1879 and an Academician in 1896, and long recognized as a specialist in paintings of old and modern Dutch subjects; the Hon. John Collier (b. 1850), trained at the Slade School, at Munich, and in Paris, and a capable painter both of the nude figure and of costume; and Edwin A. Abbey, an American (b. 1852), educated at the Pennsylvania Academy of the Fine Arts. Abbey came to England in 1876 with a great reputation as an illustrator, but did not begin to exhibit oil pictures until 1890; he was elected an Academician in 1898. Then there are to be noted classicists like Lord Leighton, Sir L. Alma-Tadema, Sir E. J. Poynter, and Edwin Long (1839–1891), a student of the East like Frederick Goodall (*b.* 1822), elected an Associate in 1853 and an Academician in 1863; and an idealist like Sir W. B. Richmond—all of whom have done much to uphold the reputation of the British school for strength of accomplishment and variety of motive.

The painters of sentiment have in the main adhered closely to the tradition which has been handed down through successive generations. They were headed in 1902 by Marcus Stone (b. 1840), elected

an Academician in 1887, an original artist whose dainty fancies are familiar to students of modern art. His pictures have nearly all appeared in the exhibitions of the Royal Academy, to which institution he has been consistently faithful. Another popular artist is G. D. Leslie (b. 1835), elected an Associate in 1868 and an Academician in 1876, who has been responsible for a number of domestic subject pictures remarkable for freshness of treatment and delicacy of feeling. The list may also be held to include Henry Woods (b. 1846), elected Associate of the Royal Academy in 1882 and Academician 1893, and since 1877 a painter of scenes from Venetian life; R. W. Macbeth (b. 1848), elected an Associate in 1883, whose elegant treatment of rustic subjects displays a very attractive individuality; E. Blair Leighton (b. 1853), who has occupied himself chiefly with imaginative motives which combine historical romance with sentiment; and P. R. Morris (1833–1902), elected an Associate 1877, who in his earlier career dealt with modern life poetically and with graceful simplicity. Among the painters of sentiment may perhaps also be included Luke Fildes (b. 1844), educated at the South Kensington and Royal Academy Schools, elected an Academician in 1887, the painter of such famous pictures as "The Casual Ward" (1874), "The Widower" (1876), "The Return of the Penitent" (1879), and "The Doctor" (1892); and Hubert von Herkomer (b. 1849), elected an Associate in 1879 and Academician 1890, famous not only by his many memorable canvases and by his extraordinary versatility in the arts, but also as a teacher and a leader in a number of educational movements.

Painters of sentiment.

Military painting.

Not many military pictures of high merit have been produced during the period. The artists, indeed, who occupy themselves with this class of art are not numerous, and they mostly devote their energies to illustrative pictures rather than large canvases. Lady Butler (*née* Elizabeth Thompson), whose "Roll Call," exhibited in 1874, brought her instantaneous popularity, continued to paint subjects of the same type, among which "Quatre Bras" (1875), "The Defence of Rorke's Drift" (1881), "The Camel Corps" (1891), and "The Dawn of Waterloo" (1895), are perhaps the most worthy of record. Ernest Crofts (b. 1847), trained in London and Düsseldorf, has taken a prominent position by such pictures as "Napoleon at Ligny" (1875), "Napoleon Leaving Moscow" (1887), "The Capture of a French Battery by the 53rd Regiment at Waterloo" (1896), and by many similar representations of historical battles; he was elected an Associate in 1878, an Academician in 1896, and became Keeper of the Royal Academy. Occasional pictures have come also from A. C. Gow (see above), R. Caton Woodville, W. B. Wollen, J. P. Beadle, and a few more men who are better known by their work in other directions; but the sum total of military paintings is inconsiderable.

Portraiture.

The number of artists who have devoted the greater part of their energies to portraiture has been steadily on the increase. Most of the men who have taken definite rank among the figure painters have made reputations by their portraits also, but there are many others who have kept almost exclusively to this branch of practice. Into the first division come such noted artists as Sir John Millais, Sir E. J. Poynter, G. F. Watts, Luke Fildes, Hubert von Herkomer, Sir L. Alma-Tadema, Sir W. B. Richmond, Seymour Lucas, the Hon. John Collier, S. J. Solomon, Arthur Hacker, W. Q. Orchardson, J. M'N. Whistler, Frank Dicksee, Stanhope Forbes, Frank Bramley, H. S. Tuke, T. C. Gotch, P. W. Steer, and Frank Holl. In the second must be reckoned J. S. Sargent, an American (b. 1856), a pupil of Carolus Duran, elected an Associate in 1894 and an Academician 1897, who after 1885 was recognized as one of the most brilliant portrait painters of the day; J. J. Shannon, also an American (b. 1862), trained at the South Kensington School, and elected an Associate in 1897, a graceful and accomplished artist, with a sound technical method and a delightful sense of style; A. S. Cope (b. 1857), trained in Paris, and elected an Associate in 1899, who carries on soundly the better traditions of the British school; James Sant (b. 1820), elected an Academician in 1870, a strong favourite of the public throughout a long career; W. W. Ouless (b. 1848), elected an Associate in 1877 and an Academician in 1881, trained in the Royal Academy Schools, an industrious and prolific worker; H. T. Wells (b. 1828), trained in London and Paris, elected Associate in 1866 and Academician in 1870, who has produced a long series of portraits and portrait groups, and many miniatures; W. Llewellyn (b. 1860), educated at the South Kensington School and in Cormon's studio in Paris, an able draughtsman and a thorough executant; C. W. Furse (b. 1868), trained first in the Slade School under Professor Legros and afterwards in Paris, one of the strongest of the younger men; and others like Walter Osborne, Richard Jack, Ralph Peacock, H. de T. Glazebrook, and J. H. F. Bacon. Generally, the school of Portraiture can be praised for its sturdy vitality. It has thrown aside most of the empty conventions by which it was once hampered; and it has gained from the French influence just enough freshness of idea to increase in the right way its power of initiative and to enhance the value of its effort. The men who belong to it are plainly convinced of the necessity for bringing to bear upon their work a proper spirit of investigation. They observe far more closely than their predecessors of half a century ago, and they analyse and depict character with a much shrewder perception of shades of individuality. But the school as a whole has lost none of its British essentials: it has, indeed, recovered much of the breadth and dignity which made it so remarkable in the 18th century, and has advanced in understanding of technical devices.

Individual figure painters.

In the class of figure painters, who are individual in their work, and owe little or nothing to the suggestions of foreign teachers, a number of artists can be enumerated who have in common little besides a sincere desire to express their personal conviction in their own way. Among them are some of the most distinguished of modern artists, who stand out as the unquestioned chiefs of the school. Sir John Millais occupies a place in this group by virtue of his admirable pictorial work, and with him are W. Holman Hunt, Dante Gabriel Rossetti, G. F. Watts, Sir Edward Burne-Jones, Albert Moore, and Ford Madox Brown, each one of whom may be regarded as a leader. There are also J. M. Strudwick, R. Spencer Stanhope, and Evelyn de Morgan, who are followers of Burne-Jones, and J. W. Waterhouse, elected an Associate of the Royal Academy 1885 and an Academician in 1895, in many ways the most original and inspired of English imaginative painters, and, again, M. Greiffenhagen and Mrs Swynnerton. Into this class come also the decorative painters, Walter Crane (b. 1845), practically self-educated—a prolific illustrator and picture-painter and the producer of an extraordinary amount of work in all branches of decoration; Frank Brangwyn, a young artist whose pictures and designs are marked by fine qualities of execution and by much sumptuousness of colour; W. Reynolds-Stephens, a painter and sculptor of well-deserved repute; and several others, like H. J. Draper, Harold Speed, R. Anning Bell, Gerald Moira, and G. Spencer Watson, who are rapidly coming to the front. As a branch of the decorative school, a small group of artists who are trying to revive the practice of *tempera-painting* must also be noted. It includes Mrs Adrian Stokes, J. D. Batten, J. E. Southall, Arthur Gaskin, and a few others with well-marked decorative tendencies.

Decorative painters.

The new Pre-Raphaelite school.

During the last few years a movement has begun which apparently aims at the revival of Pre-Raphaelitism. It is headed by a few young artists, whose methods show a mingling together of the precision of the 19th century Pre-Raphaelites and a kind of decorative formality. As yet it has not approached the laborious exactness of the earlier school, and has not arrived at that minute realization of crowded detail which was characteristic of the small knot of painters who formed the Pre-Raphaelite Brotherhood, but it has contented itself rather with a suggestion of close and careful observation—a deceptive appearance of finish. Earnest and serious in artistic intention, it may be regarded as a protest against the looser and more audacious technical practice which has resulted from the French influence, and as a reaction from the foreign teaching towards what is more in the nature of a British tradition. The most influential of the artists concerned in the formation of this new school is Byam Shaw, whose originality and quaintness of fancy give to his pictures a more than ordinary degree of persuasiveness. He is a strong colourist and an able draughtsman, and he possesses in a high degree the faculty of imaginative expression, allied with humour that never degenerates into farce. His strongest preference is for symbolical subjects which embody some moral lesson. Another prominent member of the group is Miss Eleanor Fortescue-Brickdale, who is in manner much like Byam Shaw, but yet does not sink her individuality in mere imitative effort; and others are F. Cayley Robinson and Isobel Gloag. It is too early to forecast the future progress of this group, but in 1902 it had already taken a certain position among the more active of the organizations into which the British school was subdivided.

Landscape painters.

The painters of landscapes and sea pictures have for the most part been little affected by the unrest which has caused so many new departures in figure-work. A love of nature has always been one of the best British characteristics, and it has proved itself to be strong enough to keep those artists who seek their inspiration out of doors from falling to any great extent under the control of particular technical fashions. Therefore there is in the school of "open-air" painting little evidence of any change in point of view, or of the growth of any modern feeling at variance with that by which masters of landscape were swayed a century or more ago. Impressionism has gained a few adherents, and the French Barbizon school—itself created in response to suggestion from England—has reacted upon a small section of the younger artists. But, on the whole, in this branch of art the British school has gained in power and confidence, without surrendering that sturdy

independence which in the past produced such momentous results. The absence of any common convention, or of any set pattern of landscape which would lead to uniformity of effort, has left the students of nature free to express themselves in a personal way. The most devout believers in the value of French training, and in the infallibility of the dogmas which emanate from the Paris studios, have not, except in rare instances, demanded any radical remodelling of the British landscape school on French lines, as local conditions affecting the practice of this branch of art make impossible all drastic alterations. What modifications there have been have tended chiefly in the direction of wider choice of subject and increased freedom of executive method; and now most workers in the front rank can claim to be judged on individual merits, and not as a member of a particular coterie. Still, it is convenient to divide the members of the landscape school into such classes as realists, romanticists, and painters of subjective landscape.

Realistic landscape.

Among the most notable of the first class are H. W. B. Davis (b. 1833), elected an Associate in 1873, and an Academician in 1877, the painter of a long series of dainty scenes which suggest happily the charm of rural England; Peter Graham elected an Academician in 1881, who has alternated for the greater part of his working life between Scottish moorland subjects, with cattle wandering on bare hill-sides, and pictures of coast scenery, with sea-gulls perched on dark rocks; David Murray (b. 1849), elected an Associate of the Royal Academy in 1891, an artist whose career has been marked by consistent effort to interpret nature's suggestions with dignity and intelligence; Sir Ernest A. Waterlow (b. 1850), trained in the Royal Academy Schools, elected an Associate in 1890, and afterwards President of the Royal Society of Painters in Water-Colours, a graceful painter, with a tender colour feeling and an excellent technical style; Yeend King (b. 1855), trained partly in England and partly in Paris under Bonnat and Cormon, a sound craftsman who has made a reputation by landscapes in which are introduced groups of figures on a fairly important scale; Alfred Parsons (b. 1847), elected an Associate in 1897, who paints rich river scenery with careful regard for actuality and with much minuteness and exquisiteness of detail, especially in the rendering of flowers; and Frank Walton (b. 1840), who chooses, as a rule, landscape motives which enable him to display unusual powers of accurate draughtsmanship. To the same class of realists belong several deceased painters, like Vicat Cole, Birket Foster, J. W. Oakes, Keeley Halswelle, and perhaps Alfred W. Hunt, though in his case realism was tempered by a delicate poetic imagination.

Romantic and pastoral painters.

The romanticists and pastoral painters have been perceptibly affected by the example of the Barbizon school, but they owe much to such famous Englishmen as Cecil Lawson, John Linnell (both of whom died in 1882), George Mason (d. 1872), and Frederick Walker (d. 1875). In 1902 a large number of very able artists could be included in this section of the landscape school, and this number seemed likely to be greatly increased as years went on. The most prominent member of the group is, perhaps, Alfred East (b. 1849), trained first in the Glasgow School of Art and afterwards in Paris, elected an Associate in 1899, a painter with an exceptional faculty for suggesting the poetry of nature, and endowed with an admirable sense of decorative arrangement; but there are, besides, Leslie Thomson (b. 1851), whose art is especially sound and sincere; J. Aumonier, a pastoral painter with very refined appreciation of subtleties of aërial colour; C. W. Wyllie, a painter of delicate vision and charm of presentation; J. S. Hill, whose sombre landscapes are distinguished in design and impressive in their depth of tone; R. W. Allan (b. 1852), who uses a robust technical method with equal skill in landscapes and coast subjects; J. Buxton Knight, (*b.* 1842), a vigorous manipulator, with a liking for rich harmonies and low tones; Joseph Knight (b. 1838), practically self-taught, whose well-drawn and broadly painted pictures in oil and water-colour have been for many years appreciated by lovers of unaffected nature; Lionel P. Smythe, elected an Associate of the Royal Academy in 1898, a colourist who handles exquisitely the most delicate atmospheric effects and is unusually successful in his rendering of quiet, diffused daylight; J. W. North, elected an Associate in 1893, a painter of fanciful landscapes in which definition of form is subordinated to modulations of decorative colour; Claude Hayes, who studied in the Royal Academy Schools, and has carried on consistently for some years the tradition established by David Cox and his contemporaries; J. L. Pickering, a lover of dramatic light-and-shade contrasts and a student of romantic mountain scenery; A. D. Peppercorn, who gives breadth and dignity, with sombre colour and delicate gradation of tone; Adrian Stokes and M. Ridley Corbet, who died in 1902, only a few months after his election as an Associate of the Royal Academy, a classicist in landscape, in whose pictures can be perceived a definite reflection of the teaching of Professor Costa, the Italian master. There must also be noted, as leaders among the pastoral painters, George Clausen (b. 1852), trained first in the South Kensington School and afterwards in Paris under Bouguereau and Robert-Fleury, and elected an Associate in 1895, who began as a strict realist and has developed since into a rustic idealist; H. H. La Thangue, trained in the Royal Academy Schools and in Paris, elected an Associate in 1898, an artist of amazing technical vigour, and an uncompromising interpreter of rural subjects; Edward Stott, trained in Paris under Carolus-Duran and Cabanel, who paints delicately the more poetic aspects of the life of the fields; and Arnesby Brown, a pupil of Professor von Herkomer, who has taken latterly a very prominent place among the younger artists—his picture "Morning" was bought in 1901 by the Chantrey Fund Trustees, and "River Bank" in 1902 for the Guildhall Art Gallery.

Subjective landscape.

The painters of subjective landscape, who conventionalize nature with the idea of giving to their pictures a kind of sentimental suggestion, are most strikingly represented by B. W. Leader (b. 1831), trained in the Worcester School of Design and in the Royal Academy Schools, and elected an Academician in 1898. He is a strong favourite of the public, and his somewhat formal and precise technical methods are widely admired by the many people who are not satisfied with unaffected transcriptions of natural scenes.

Marine painting.

In marine painting no one has appeared to rival Henry Moore, perhaps the greatest student of wave-forms the world has ever known; but good work was being done in 1902 by the Irish painter, Edwin Hayes, a veteran whose powers showed no sign of failure after some half-century of continuous labour; W. L. Wyllie (b. 1851), trained in the Royal Academy Schools, and elected an Associate in 1889, who paints sea and shipping with intelligent understanding; T. Somerscales, a self-taught artist, with an intimate knowledge of the ocean derived from long actual experience as a sailor; C. Napier Hemy (b. 1841), trained at the Antwerp Academy and in the studio of Baron Leys, elected an Associate in 1898, a powerful manipulator, with a preference for the dramatic aspects of his subject; and J. C. Hook, who retained into old age the subtle qualities which made his pictures notable among the best productions of the British school. Of the men who have fallen out of the ranks, mention must be made of John Brett (1830–1902), the one Pre-Raphaelite sea painter, and Hamilton Macallum (1841–1896), who painted rippling water in bright sunlight with delightful delicacy and charm of manner.

Animal painting.

The school of animal painting is a small one, and includes only a few of marked ability. The chief members include Briton Riviere, one of the most imaginative and inventive of living artists; J. M. Swan, trained first at Lambeth, and afterwards in Paris under Gérôme and Frémiet, elected an Associate of the Royal Academy in 1894, a skilful manipulator and a sensitive draughtsman, and especially remarkable for his intimate understanding of animal character, especially of the *felidæ* (see also SCULPTURE); J. T. Nettleship (1841–1902), trained chiefly in the Slade School, whose studies of the greater beasts of prey are admirably sincere and well painted; Miss Lucy Kemp-Welch (b. 1869), trained in the Herkomer School at Bushey, who paints horses with unusual power; and John Charlton (b. 1849), trained in the South Kensington School, also well known by his pictures of horses.

Scottish schools.

There are some local schools which have a right to attention because of the value of their contributions to the aggregation of British art. One of the most active of these is the Scottish school, with its centres at Glasgow and Edinburgh, which has produced some of the most distinguished British artists. The Royal Academy, indeed, with most of the other leading art societies, has been largely recruited from Scotland. There have been added to its modern roll the names of W. Q. Orchardson, Peter Graham, J. MacWhirter, J. Pettie, Erskine Nichol, T. Faed, David Murray, Colin Hunter, R. W. Macbeth, J. Farquharson, all of them painters of well-established reputation; and outside the Academy there are many well-known Scottish artists, who have made London their headquarters, like Arthur Melville, a portrait and subject painter and a masterly water-colourist; E. A. Walton, who is equally successful with portraits, landscapes, and decorative compositions; J. Coutts-Michie, who alternates between portraiture and landscapes of admirable quality; John Lorimer, who has exhibited a number of excellent subject pictures and many fine portraits; T. Graham, an unaffected painter of sentiment and a good colourist; Grosvenor Thomas, known best by his freely handled and expressive landscapes; T. Austen Brown, who paints semi-decorative pastorals with unusual vigour of statement; John Lavery, who has taken rank among the best of the younger portrait painters; and Robert Brough, another portrait painter of vigour, with a subtle sense of colour. The most notable of the men who still remain in Scotland include Alexander Roche, whose remarkable capacity has brought him many successes in portraiture, figure compositions, and decorative paintings on a large scale; W. Y. MacGregor, a

leader of the school of landscape painters, fine in style and a master of effect; D. Y. Cameron, an admirable oil painter and a famous etcher; George Henry, Harrington Mann, and James Guthrie, well known by their excellent portraits; James Paterson, R. B. Nisbet, Robert Noble, R. Macaulay Stevenson, and David Farquharson, all landscape painters of marked originality and sound technical method; W. McTaggart, an impressionist who is regarded as a leader of the school; E. A. Hornel and W. Hole, decorative painters who have produced many canvases remarkable for robust originality and rare breadth of treatment; W. Mouncey, a landscape painter who united the dignity of the Barbizon school with a typically Scottish freedom of expression; and Sir George Reid, one of the ablest and most distinguished of portrait painters.

The chief characteristics which all these artists have in common are unusual directness and readiness of brushwork, remarkable subtlety of tone-management, and great sensitiveness to modulations of delicate colour. They are brilliant craftsmen, and are eminently sincere in their regard for nature's suggestions; and as a school they show a unanimity of artistic conviction which keeps them closely in touch without leading them into excess of convention.

Water-colour. The water-colour painters can fairly be said to have kept unchanged the essential qualities of their particular form of practice. They have departed scarcely at all from the executive methods which have been recognized as correct for nearly a century, but they have amplified them and have adapted them to a greater range of accomplishment, developing, it may be added, the "blottesque" or accidental manner suggestive of summary decision. Latterly water-colour painting has come to rival oils in its application to all sorts of subjects; and it is used now with absolute freedom by a very large number of skilful artists. Many of the men who have done the best work in this medium are known as oil painters of the highest rank; and among living workers the same capacity to excel in either mode of expression is by no means uncommon. There have been in recent times such masters as Sir John Gilbert, Sir E. Burne-Jones, Ford Madox Brown, Dante Gabriel Rossetti, A. W. Hunt, H. G. Hine, Henry Moore, Albert Moore, C. E. Holloway, and, perhaps, E. M. Wimperis, whose water-colours are at least as worthy of admiration as their oil pictures. As water-colourists, much credit is due to Sir E. J. Poynter for his landscapes, portraits, and figure drawings, Sir L. Alma-Tadema for his minutely detailed classic subjects, Sir J. D. Linton for his historical and romantic compositions, Sir E. A. Waterlow for his delicately expressive landscapes, Hubert von Herkomer for his admirably handled figure subjects, George Clausen for pastorals charming in sentiment and distinguished by fine qualities of colour, J. Aumonier, A. D. Peppercorn, J. S. Hill, J. W. North, Leslie Thomson, Frank Walton, and R. W. Allan for landscapes of special excellence, E. J. Gregory for figure compositions painted with amazing sureness of touch, Alfred Parsons for landscapes and flower studies, J. R. Reid, W. L. Wyllie, E. Hayes, and C. N. Hemy for sea and coast pictures, R. W. Macbeth, Claude Hayes, and Lionel Smythe for rustic scenes with figures in the open air, J. M. Swan for paintings of animals, and G. H. Boughton for costume subjects and delicately poetic fancies. Besides, there is a long list of noteworthy painters whose reputations have been chiefly or entirely made by their successful management of water-colour, and into this list come Birket Foster, the head of the old-fashioned school of dainty rusticity; Carl Haag, a wonderful manipulator, who occupied himself almost exclusively with Eastern subjects; Thomas Collier, A. W. Weedon, H. B. Brabazon, G. A. Fripp, P. J. Naftel, G. P. Boyce, Albert Goodwin, R. Thorne-Waite, F. G. Cotman, Harry Hine, Clarence Whaite, and Bernard Evans, whose landscapes show thorough understanding of nature and distinctive individuality of method; Mrs Allingham, an artist of exquisite refinement, whose idealizations of country life have a more than ordinary degree of merit; Clara Montalba, an able painter of impressions of Venice; Kate Greenaway, unrivalled as an interpreter of the graces of childhood, and endowed with the rarest originality; Mrs Stanhope Forbes, an accomplished executant of well-imagined romantic motives; and J. R. Weguelin, one of the most facile and expressive painters of fantastic figure subjects. By the aid of these artists, and many others of hardly less ability, such as J. Crawhall, J. Paterson, R. Little, and J. Walter West, traditions worthy of all respect are being maintained sincerely and with intelligent discrimination; and to their efforts has been accorded a larger measure of popular support than is bestowed upon any other form of pictorial production.

Books upon the British School of Painting are numerous, and a vast number of biographies and autobiographies of painters have been published, all bearing on the subject. Of the first-named class the following may be enumerated:—

RICHARD MUTHER. *The History of Modern Painting* (English edition, 1895).—R. DE LA SIZERANNE. *English Contemporary Art* (English edition, 1898).—ERNEST CHESNEAU. *The English School of Painting* (2nd English edition, 1885).—CLEMENT and HUTTON. *Artists of the 19th Century* (Boston, U.S.A., 1885).—DAVID MARTIN and F. NEWBERY. *The Glasgow School of Painting* (1897).—E. PINNINGTON. *George Paul Chalmers and the Art of his Time* (1896).—GLEESON WHITE. *The Master Painters of Britain* (1897).—E. T. COOK. *A Popular Handbook to the National Gallery*, vol. ii. (1901).—J. E. HODGSON, R.A. *Fifty Years of British Art* (1887).—A. G. TEMPLE. *Painting in the Queen's Reign* (1897).—COSMO MONKHOUSE. *British Contemporary Artists* (1899).—G. R. REDGRAVE. *History of Water-Colour Painting in England, 1750–1889* (1889).

See also the *Transactions* of the National Association for the Advancement of Art (Liverpool 1888, Edinburgh 1889, and Birmingham 1890); the magazines devoted to the arts—The *Portfolio*, the *Magazine of Art*, the *Art Journal*, and the *Studio*; and the principal reviews, such as "English Art in the Victorian Age" (*Quarterly Review*, January 1898). (M. H. S.)

FRANCE.

The period between 1870 and the end of the 19th century was singularly important in the history of France, and consequently of her art. The internal life of the people developed on new lines with a vigour that left a deep mark on the outcome of mental effort. Literature was foremost in this new movement. The novels of Balzac, Zola, Flaubert, the brothers de Goncourt, Daudet, Guy de Maupassant, and the plays of Alexandre Dumas *fils*, filled as they are with the scientific spirit and social atmosphere of the time, opened the eyes of the young generation to appreciation of the visible beauty and the spiritual poetry of the world around them, and helped them to view it with more attentive eyes, more insight, and more emotion. The aim of art was also to emancipate itself, by the growing efforts of independent artists, from the slavery of tradition, and to devote itself to a more personal contemplation and knowledge of contemporary life under every aspect. Modern French art tends to become more and more the art of the people—a mixture of naturalism and poetry, deriving its inspiration, by preference, from the world of the working man; no longer appealing only to a restricted and more or less fastidious public, but, on the contrary, adapting its æsthetic or moral teaching to popular apprehension. The whole past was not, of course, wiped out. The younger generation had to learn and profit by the lessons taught by their great precursors. To understand the true character of this recent development of French art it is needful, therefore, to glance at the past.

We need not dwell on the individual authorities who constitute the official hierarchy of the contemporary French school; these masters belong for the most part, by the date of their best work, to a former generation. Starting in many cases from very opposite points, but reconciled and united by time, they carried on, during the last quarter of the 19th century, with more or less distinction, the inevitable evolution of their personal gifts. We still see the works of some of the staunch Romanticists: Jean Gigoux (d. 1892), Robert Fleury (d. 1890), Jules Dupré (d. 1889), Lami (d. 1890), Cabat (d. 1893), and Isabey (d. 1886); and with these, though they did not follow quite the same road, may be named Français (d. 1897) and Charles Jacque (d. 1894). Next to them, Meissonier (d. 1891) crowded into the last twenty years of his life a mass of work which, for the most part, enhanced his fame; and Rosa Bonheur (d. 1899), working in retirement up to the age of seventy-seven, went on her accustomed way unmoved by external changes. Hébert, Harpignies, Ziem, and Paul Flandrin survived. Among the generation which grew up under the Second Empire we find men of great intelligence and distinction; some, like Alexandre Cabanel (1824–89), by pictures of historical genre, in a somewhat insipid and conventional style, but more particularly by female portraits, firm in flesh-paint-

ing and aristocratic in feeling; others, like Paul Baudry (1828–86, *q.v.*), whose large decorative works, with their pure and lofty elegance, secured him lasting fame, and whose allegorical compositions were particularly remarkable; not less so his portraits, at first vivid, glowing, and golden, but at the end of his life, under the influence of the new atmosphere, cooler in tone, but more eager, nervous, and restless in feeling. Léon Gérôme (b. 1824, *q.v.*) was the orginator, during the Second Empire, of the Neo-Greek idea, an Orientalist and painter of historic genre, whose somewhat arid instinct for archæological precision and finish developed to better ends in sculpture during later years. William Bouguereau (b. 1825, *q.v.*) painted symbolical and allegorical subjects in a sentimental style. Jules Lefebvre (b. 1836) had a brilliant career as a portrait painter, combined, in his earlier years, with admirable studies of the nude. These were followed by Benjamin Constant (d. 1902), a clever painter of past ages in the East and of modern Oriental life, who latterly directed his powers of vigorous and rapid brushwork to portrait-painting; Fernand Carmon, the inventive chronicler of primeval Gaul, and a solid and learned portrait painter; Aimé Morot, a man of versatile gifts, a painter of portraits full of life and ease. These formed the heart of the Institut. On the other hand, we find a group who betray a close affinity with the realist party—rejecting, like them, tradition at second-hand, though returning for direct teaching to some of the great masters: Léon Bonnat (b. 1833), educated in Spain, and preserving through a long series of official portraits an evident worship of the great realists of that nation; and again, under the same influence, Jean Paul Laurens (b. 1837), who has infused some return of vitality into historical painting by his clear and individual conceptions and realistic treatment. Jean Jacques Henner (b. 1829, *q.v.*), standing even more apart, lived in a Correggio-like dream of pale nude forms in dim landscape scenery. His love of exquisite texture, and his unvarying sense of beauty, with his refined dilettantism, link him on each side to the great groups of realists and idealists.

About the middle of the 19th century, after the vehement disputes between the partisans of line and the votaries of colour, otherwise the Classic and the Romantic schools, when a younger generation was resting from these follies, exhausted, weary, devoid even of any fine technique, two groups slowly formed on the opposite sides of the horizon —seers, or dreamers, both, protesting in different ways against the collapse of the French school, and against the alleged indifference and sceptical eclecticism of the painters who were regarded as the leaders. This was a revolt from the academic and conservative tradition. One was the group of original and nature-loving painters, keen and devoted observers of men and things, the realists, made illustrious by the three great personalities of Corot (*q.v.*), Millet (*q.v.*), and Courbet (*q.v.*), the real originators of French contemporary art. The other was the group of men of imagination, the idealists, who, in the pursuit of perfect beauty and an ideal moral standard, reverted to the dissimilar visions of Delacroix and Ingres, the ideals of rhythm as opposed to harmony, of style *versus* passion, which Théodore Chassériau had endeavoured to combine. Round Puvis de Chavannes (*q.v.*) and Gustave Moreau (*q.v.*) we find a group of artists who, in spite of the fascination exerted on their intelligence by the great works of the old masters, especially the early Florentines and Venetians, would not accept the old technique, but strove to record in splendid imagery the wonders of the spiritual life, or claimed, by studying contemporary individuals, to reveal the psychology of modern minds. Among them were Gustave Ricard (1821–73), whose portraits, suggesting the mystical charm sometimes of Leonardo and sometimes of Rembrandt, are full of deep unuttered vitality; Elie Delaunay (1828–91), serious and expressive in his heroic compositions, keen and striking in his portraits; Eugène Fromentin (1820–76), acute but subtle and silvery, a man of elegant mind, the writer of *Les Maîtres d'Autrefois*, of *Sahel*, and of *Le Sahara*, the discoverer — artistically — of Algeria. And round the loud and showy individuality of Courbet—healthy, nevertheless, and inspiring—a group was gathered of men less judicious, but more stirring, more truculent, thoroughly original, but not less reverent to the old masters than they were defiant of contemporary authorities. They were even more ardent for a strong technique, but the masters who attracted them were the Dutch, the Flemish, the Venetians, who, like themselves, had aimed at recording the life of their day. Among these was François Bonvin (1817–87), who, following Granet, carried on the evolution of a subdivision of genre, the study of domestic interiors. This Drolling, too, had done, early in the 19th century, his predecessors in France being Chardin and Le Nain. This class of subjects has not merely absorbed all genre-painting, but has become a very important factor in the presentment of modern life. Bonvin painted asylums, convent-life, studios, laboratories, and schools. Alphonse Legros (*q.v.*), painter, sculptor, and etcher, who settled in London, was of the same school, though independent in his individuality, celebrating with his brush and etching-needle the life of the poor and humble, and even of the vagabond and beggar. There were also Bracquemond, the reviver of the craft of etching; Fantin-Latour, the painter of highly romantic Wagnerian dreams, figure compositions grouped after the Dutch manner, and flower-pieces not surpassed in his day. Ribot, again, and Vollon, daring and dashing in their handling of the brush; Guillaume Régamey, one of the few military painters gifted with the epic sense; and even Carolus Duran, who, after painting "Murdered" (in the Lille Museum), combined with the professional duties of an official teacher a brilliant career as a portrait painter. A later member of this group, attracted to it by student friendship in the little drawing-school which under Lecoq de Boisbaudran competed in a modest way with the École des Beaux Arts, was J. C. Cazin, well known afterwards as a pronounced idealist. Finally, there was Manet, a connecting link between the realists and the impressionists. These two radiant focuses of imagination and of observation respectively were to be seen still intact during the later period, as represented by the most energetic of the masters who upheld them.

After the catastrophe of 1870, French art appeared to be reawakened by the disasters of the country; and at the great exhibition in Vienna in 1873 Count Andrassy exclaimed to Léon Bonnat, "After such a terrible crisis you are up again, and victorious!" Immense energy prevailed in the studios, and money poured into France in consequence. The output increased rapidly, and at the same time study became more strenuous, and ambition grew bolder and more manly. Renewed activity stirred in the public academies, and a crowd of foreign students came to learn. Two great facts give a characteristic stamp to this new revival of French art: I. In the class of imaginative painting, the renewed impulse towards monumental or decorative work. II. In the class of nature studies, the growth of landscape painting, which developed along two parallel lines—impressionism and the "open-air" school.

I. *Decoration.*—In decorative painting two men were the soul of the movement: Puvis de Chavannes and Philippe de Chennevières Pointel. As we look back on the last years of the Second Empire, we see decorative painting sunk in profound lethargy. After Delacroix,

Chasseriau, and Hippolyte Flandrin, and the completion of the great works in the Palais Bourbon, the Senate House, the Cour des Comptes, and a few churches—St Sulpice, St Vincent de Paul, and St Germain des Prés—no serious attempts had been made in this direction. Excepting in the Hôtel de Ville, where Cabanel was winning his first laurels, and in the Opera House, a work that was progressing in silence, a few chapels only were decorated with paintings in the manner of easel pictures. But two famous exceptions led to a decorative revival: Puvis de Chavannes' splendid scheme of decoration at Amiens (all, with the exception of the last composition, which is dated 1882, executed without break between 1861 and 1867), and his work at Marseilles and at Poitiers; Baudry, with his ceiling in the Opera House, begun in 1866 but not shown to the public till 1874. There was also a movement for reviving French taste in the industrial arts by following the example of systematic teaching set by some foreign countries, more particularly by England. Decorative painting felt the same impulse. Philippe de Chennevières, curator of the Luxembourg Gallery and directeur des Beaux Arts (from 1874 till 1879), determined to encourage it by setting up a great rivalry between the most distinguished painters, like that which had stimulated the zeal of the artists of the Italian Renaissance. Taking up the task already attempted by Chenavard under the Republic of 1848, but abandoned in consequence of political changes, M. de Chennevières commissioned a select number of artists to decorate the walls of the Panthéon. The panels were to record certain events in the history of France, with due regard to the sacred character of the building. Twelve of the most noted painters were named, with a liberal breadth of selection so as to include the most dissimilar styles: Millet and Meissonier, of whom one refused and the other did not carry out the work; Cabanel and Puvis de Chavannes. The last named was the first to begin, in 1878, and he too was the painter who put the crowning end to this great work in 1898. His pictures of the "Childhood of Ste Geneviève" (the patron saint of Paris), simple, full of feeling and of innocent charm, appropriate to a popular legend, with their airy Parisian landscape under a pallid sky, made a deep impression. Thenceforward Puvis de Chavannes had a constantly growing influence over younger men. His magnificent work at Amiens, "Ludus pro Patria" (1881–82), at Lyons, and at Rouen, in the Sorbonne and the Hôtel de Ville, for the Library at Boston, U.S.A., and on to his last composition, "The Old Age of Ste Geneviève," upheld to the end of the 19th century the sense of lofty purpose in decorative painting. Besides the Panthéon, which gave the first impetus to the movement, Philippe de Chennevières found other buildings to be decorated: the Luxembourg, the Palace of the Legion of Honour, and that of the Council of State. The paintings in the Palais de Justice, the Sorbonne, the Hôtel de Ville, the College of Pharmacy, the Natural History Museum, the Opéra Comique, and many more, bear witness to this grand revival of mural painting. Every kind of talent was employed — historical painters, portrait painters, painters of allegory, of fancy scenes, of real life, and of landscape. Among the most important were: J. P. Laurens and Benjamin Constant, Bonnat and Carolus Duran, Cormon and Humbert, Joseph Blanc and L. Olivier Merson, Roll and Gervex, Besnard and Carrière, Harpignies and Pointelin, Raphaël Collin and Henri Martin.

II. *Impressionism.*—In 1874 common cause was made by a group of artists drawn together by sympathetic views and a craving for independence. Various in their tastes, they concentrated from every point of the compass to protest, like their precursors the realists, against the narrow views of academic teaching. Some had romantic proclivities, as the Dutchman Jongkindt, who played an important part in founding this group; others were followers of Daubigny, of Corot, or of Millet; some came from the realistic party, whose influence and effort this new set was to carry on. Among these, Édouard Manet (1833–83) holds a leading place; indeed, his influence, in spite of—or perhaps as a result of—much abuse, extended beyond his circle even so far as to affect academic teaching itself. He was first a pupil of Couture, and then, after Courbet, his real masters were the Spaniards—Velasquez, El Greco, and Goya, all of whom he closely studied at the beginning of his career; but he soon felt the influence of Millet and of Corot. With a keen power of observation, he refined and lightened his style, striving for a subtle rendering of the exact relations of tone and values in light and atmosphere. With him, forming the original group, as represented by the Caillebotte collection in the Luxembourg, we find some landscape painters: Claude Monet, the painter of pure daylight, and the artist who by the title of one of his pictures, "An Impression," gave rise to the designation accepted by the group; Camille Pissarro, who at one time carried to an extreme the principle of dotting with pure tints, known as *pointillisme*, or dot-work; Sisley, Cézanne, and others. Among those who by preference studied the human figure were Edgard Degas (*q.v.*) and Auguste Renoir. After long and violent antagonism, such as had already greeted the earlier innovators, these painters, in spite of many protests, were officially recognized both at the Luxembourg and at the great Exhibition of 1900. Their aims have been various, some painting Man, and some Nature. In the former case they claim to have gone back to the principle of the greatest artists and tried to record the life of their own time. Manet, Degas, and Renoir have shown us aspects of city or vulgar life which had been left to genre-painting or caricature, but which they have represented with the charm of pathos, or with the bitter irony of their own mood, frank transcripts of life with a feeling for style. For those who painted the scenery of nature there was an even wider field. They brought to their work a new visual sense, released from the clinging memories of past art; they endeavoured to fix the transient effects of moving life, changing under the subtlest and most fugitive effects of light and atmosphere, and the play of what may be called the elements of motion—sunshine, air, and clouds—caring less for the exact transcript of motionless objects, which had hitherto been almost exclusively studied, such as the soil, trees, and rocks, the inanimate features of the landscape. They introduced a fresh lightness of key, which had been too subservient to the relations of values; they discovered for their ends a new class of subjects essentially modern: towns, streets, railway stations, factories, coal-mines, iron-works, and smoke, which they represent with an intelligent adaptation of Japanese art, taking new and audacious points of view, constantly varying the position of their horizon. This is indeed the very acme of naturalism, the last possible stage of modern landscape, covering the whole field of observation, doubling back to the starting-point of imagination. Notwithstanding—or because of—the outcry, all these views, peculiarities, and tendencies soon penetrated schools and studios. Three artists in particular became conspicuous among the most individual and most independent spirits: Besnard, who had taken the Grand Prix de Rome, and carried to the highest pitch his inexhaustible and charming fancy in studies of the figure under the most unexpected play of light; Carrière, a pupil of Cabanel, who sought and found in mysterious gloom the

softened spirit of the humble, the warm caress of motherhood; and Raffaëlli, a pupil of Gérôme, who brought to light the unrecognized picturesqueness of the lowest depths of humanity.

III. *The "plein-air," or open-air, school.* The same causes explain the rise of the particular class of work thus commonly designated. Between Millet and Courbet, both redolent of the romantic and naturalistic influences of their time, though apart from them, stands an artist who had some share in establishing the continuity of the line of painters who combined figure-painting with landscape. This is Jules Breton (b. 1827, *q.v.*). More supple than his fellows, less harsh and less wilful, caring more for form and charm, he found it easier to treat "masses," and contributed to diffuse a taste for the artistic presentment and glorification of field labour. He was the chief link between a past style and Jules Bastien-Lepage (1848–84, *q.v.*), who was in fact the founder of the school of open-air painting, a compromise between the academic manner and the new revolutionary ideas, a sort of academic continuation of the naturalistic evolution, which therefore exerted considerable influence on contemporary art. As a pupil of Cabanel and the Academy schools, enamoured of rustic life, he absorbed at an early stage, though not without hesitation, the love of atmospheric effects characteristic of Corot and of Manet. In his open-air heads and rural scenes he is seen as a conscientious nature worshipper, accurate and sincere, and, like Millet, imbued with a touch of mysticism which becomes even more evident in his immediate pupils. Round him there arose a little galaxy of painters, some more faithful to tradition, some followers of the best innovators, who firmly tread this path of light and modern life. Those are Butin, Duez and Renouf, Roll and Gervex, Dagnan-Bouveret, Friant, Adolphe and Victor Binet, and many more.

Immediately after the Exhibition of 1889 an event took place which was not without effect on the progress of French art. This was the schism in the Salon. The audacious work of the Société Nationale des Beaux Arts, which left anything that the Impressionists could do far behind, had accustomed the eyes of the public to the most daring attempts, while the numerous contributions of foreigners, especially from the north, where art aimed solely at a direct presentment of daily life, was a fresh encouragement to the study of modern conditions and of the lower classes. But, at the same time, the encroachment on space at the Exhibition (where no limit of number was imposed) by mere studies, hastened the reaction against the extravagances of the degenerate followers of Courbet, Manet, and Bastien-Lepage. Remonstrances arose against their perverse and narrow-minded devotion to "truth," or rather to minute exactitude, their pedantry and affectation of documentation; sometimes derived from some old colourists who had not renounced their former ideal, sometimes from younger men impelled unconsciously by literature, which had as usual preceded art in the revolt. The protest was seen, too, in a modified treatment of landscape, which took on the warmer colours of sunset, and in a choice of religious subjects, such as a *pardon*, or a funeral, or a ceremonial benediction, and generally of more human and more pathetic scenes.

Bastien-Lepage, like his great precursor Millet, bore within him the germs of a reaction against the movement he had helped to promote. Dagnan-Bouveret, who began by painting "Sitting for a Photograph" (now at Lyons) and "An Accident," after painting "Le Pain bénit," ended with "The Pilgrims to Emmaus" and "The Last Supper." Friant, again, produced scenes of woe, "All Saints' Day" and "Grief"; and their younger successors, Henri Royer, Adler, Duvent, and others, who adhered to this tradition, accommodated it to a more modern ideal, with more vivid colouring and more dramatic composition.

Still, this normal development could have no perceptible effect in modifying the purpose of painting. More was needed. A strong craving for imaginative work was very generally felt, and was revealing itself not merely in France but in Belgium, Scotland, America, and Germany. This tendency ere long resulted in groups forming round certain well-known figures. Thus a group of refined dreamers, of poetic dilettanti and harmonious colourists, assembled under the leading of Henri Martin (a strange but attractive visionary, a pupil of Jean Paul Laurens and direct heir to Puvis de Chavannes, from whom he had much sound teaching) and of Aman-Jean, who had appeared at the same time, starting, but with more reserve, in the same direction. Some of this younger group affected no specific aim; the others, the larger number, leant towards contemporary life, which they endeavoured to depict, especially its aspirations and—according to the modern expression now in France of common usage—its "state of soul," typified by melody of line and the eloquent language of harmonies. Among them should be named, as exhibitors in the Salons and in the great Exhibition of 1900, Ernest Laurent, Ridel, and Hippolyte Fournier, M. and Mrs H. Duhem, Le Sidaner, Paul Steck, &c. On the other hand, a second group had formed of sturdy and fervent naturalistic painters, in some ways resembling the school of 1855 of which mention has been made; young and bold, sometimes over-bold, enthusiastic and emotional, and bent on giving expression to the life of their own day, especially among the people, not merely recording its exterior aspects but epitomizing its meaning by broad and strong synthetical compositions. At their head stood Cottet, who combined in himself the romantic fire and the feeling for orchestrated colour of Delacroix with the incisive realism and bold handling of Courbet; next, and very near to him, but more objective in his treatment, Lucien Simon, a manly painter and rich colourist. Both by preference painted heroic or pathetic scenes from the life of Breton mariners. After them came René Ménard, a more lyrical artist, whose classical themes and landscape carried us back to Poussin, and Dauchez, Prinet, Wéry, &c.

Foreign influences had meanwhile proved stimulating to the new tendencies in art. Sympathy with the populace derived added impulse from the works of the Belgian painters Constantin Meunier, Léon Frédéric, and Struys; a taste for strong and expressive colouring was diffused by certain American artists, pupils of Whistler, and yet more by a busy group of young Scotsmen favourably welcomed in Paris. But the most unforeseen result of this reactionary movement was a sudden reversion to tradition. The cry of the realists of every shade had been for "Nature!" The newcomers raised the opposition cry of "The Old Masters!" And in their name a protest was made against the narrowness of the documentary school of art, a demand for some loftier scheme of conventionality, and for a fuller expression of life, with its complex aspirations and visions. The spirit of English Pre-Raphaelitism made its way in France by the medium of translations from the English poets Shelley, Rossetti, and Swinburne, and the work of their followers Stephane Mallarmé and Le Sâr Peladan; it gave rise to a little artificial impetus, which was furthered by the simultaneous but transient rage for the works of Burne-Jones, which were exhibited with his consent in some of the Salons, and by the importation of William Morris's principles of decoration. The outcome was a few small groups of symbolists, the most famous being that of the Rose ✠ Croix, organized by

Le Sâr Peladan; then there was Henri Martin, and the little coterie of exhibitors attracted by a dealer, the late M. le Bare de Bouttiville, in which Cottet was for a short time entangled. But few interesting names are to be identified: Dulac (d. 1899), who became known chiefly for his mystical lithographs in colour; Maurice Denis and Bonnart, whose decorative compositions, with their refined and harmonious colouring, are not devoid of charm; Vuillard, &c. But it was in the school and studio of Gustave Moreau (1826–1898, *q.v.*) that the fire of idealism burned most hotly. This exceptional man and rare painter, locked up in his solitude, endeavoured, by a thorough and intelligent assimilation of all the traditions of the past, to find and create for himself a new tongue—rich, nervous, eloquent, strong, and resplendent—in which to give utterance to the loftiest dreams that haunt the modern soul. He revived every old myth and rejuvenated every antique symbol, to represent in wonderful imagery all the serene magnificence and all the terrible struggles of the moral side of man, which he had explored to its lowest depths and most heroic heights in man and woman, in poetry and in death. Being appointed, towards the end of his life, to a professorship in the École des Beaux Arts, he regarded his duties as a real apostleship, and his teaching soon spread from his lecture-room and studio to those of the other masters. His own work, though hardly known to his pupils at the time, at first influenced their style; but, especially after his death, they were quickly disgusted with their own detestable imitation of subjects on which the master had set the stamp of his great individuality; they deserted the fabulous world of the Greek Olympus and the wonderful gardens of the Bible, to devote them to a passionate expression of modern life. Desvallières, indeed, remained conspicuous in his original manner; Sabatté, Maxence, Béronneau, Besson, and many more happily worked out their way on other lines.

In trying to draw up the balance-sheet of art in 1902, it were vain to try to enter its work under the old-world headings of History, Genre, Portraits, Landscape. All the streams had burst their channels, all the currents mingled. Historical painting, reinstated for a time by Puvis de Chavannes and J. P. Laurens, in which Benjamin Constant and Cormon also distinguished themselves, had but a few adherents who tried to maintain its dignity, either in combination with landscape, like M. Tattegrain, or with the ineffectual aid of archæology, like M. Rochegrosse. At certain times, especially just after 1870, the memory of the war gave birth to a special genre of military subjects, under the distinguished guidance of Meissonier (*q.v.*), and the peculiar talents of Alphonse de Neuville (*q.v.*), of Detaille (*q.v.*), and Protais. This phase of contemporary history being exhausted, gave way to pictures of military manœuvres, or colonial wars and incidents in recent history; it latterly went through a revival under a demand for subjects from the Empire and the Revolution, in consequence of the publication of many memoirs of those times. Side by side with "history," religious art formerly flourished greatly; indeed, next to mythology, it was always dear to the Academy. Apart from the subjects set for academical competitions, there was only one little revival of any interest in this kind. This was a sort of neo-evangelical offshoot, akin to the literature and stress of religious discussion; and its leader, a man of feeling rather than conviction, was J. C. Cazin (d. 1901). Like Puvis de Chavannes, and under the influence of Corot and Millet, of Hobbema, and yet more of Rembrandt, he attempted to renew the vitality of history and legend by the added charm of landscape and the introduction of more human, more living and more modern, elements into the figures and accessories. Following him, a little group developed this movement to extravagance. The recognized leader at the beginning of the 20th century was Dagnan-Bouveret.

Through mythology and allegory we are brought back to real life. No one now thinks in France of seeking any pretext for displaying the nude beauty of woman. Henner, perhaps, and Fantin-Latour, were the last to cherish a belief in Venus and Artemis, in naiads and nymphs. Painters go direct to the point nowadays; when they paint the nude, it is apart from abstract fancies, and under realistic aspects. They are content with the model. It is the living female. The whole motor force of the time lies in the expression, under various kinds of real life. This it is which has given such a soaring flight to the two most primitive forms of the study of Life, landscape and portraiture. Portraits have in fact adopted every style that can possibly be imagined: homely or fashionable, singly or in groups, by the fire or out of doors, in some familiar attitude and the surroundings of daily life, analytically precise, or synthetically broad, a literal transcript or a bold epitome of facts. As to landscape, no class of painting has been busier, more alive, or more productive. It has overflowed into every other channel of art, giving them new spirit and a new life. It has led the van in every struggle and won every victory. Never was army more numerous or more various than that of the landscape painters, nor more independent. All the traditions find representatives among them, from Paul Flandrin to René Ménard. Naturalists, impressionists, open-air painters, learned in analysis or potent in invention. We need only name Harpignies, broadly decorative; Pointelin, thoughtful and austere; and Cazin, grave and tender, to give a general idea of the strength of the school.

Every quarter of the land has its painters: the North and the South, Provence and Auvergne, Brittany, dear to the young generation of colourists, the East, Algeria, Tunis—all contribute to form a French school of landscape, very living and daring, of which, as successors of Fromentin and Guillaumet, must be named Dinet, Marius Perret, Paul Leroy, and Girardot. But it is more especially in the association of man and nature, in painting simple folk and their struggle for life amid their natural surroundings or by their homely hearth, in the glorification of humble toil, that the latest French art finds its most characteristic ideal life. (L. BE.)

BELGIUM.

Belgium fills a great place in the realm of art; and while its painters show a preference for simple subjects, their technique is broad, rich, and sound, the outcome of a fine tradition. Since 1855 international critics have been struck by the unity of effect produced by the works of the Belgian school, as expressed more especially by similarities of handling and colour. For the things which distinguish all Belgian painters, even in their most unpictorial divagations, are a strong sense of contrast or harmony of colouring, a free, bold style of brushwork, and a preference for rich and solid painting. It is the tradition of the old Flemish school. It would be more correct, indeed, to say traditions; for the modifications of each tendency, inevitably reviving when the success of another has exhausted itself, constantly show a reversion either to the domestic "Primitives" (or, as we might say, Pre-Raphaelites) of the Bruges school, or to the "decorative" painters of the later time at Antwerp, and no veneer of modern taste will ever succeed in masking this traditional perennial groundwork. In this way the prevailing authority of the French painter Louis David may be accounted for; as acknowledged at Brussels at the beginning of the 19th century, it was a reaction in antagonism to the heavy

and flabby work of the late Antwerp school, an unconscious reversion perhaps to the finish and minuteness of the early painters of Bruges. Indeed, in France, Ingres, himself David's most devoted disciple, was reproached with trying to revive the Gothic art of Jean de Bruges. Then, when David's followers produced only cold and feeble work, Wappers arose to restore the methods of another tradition, for which he secured a conspicuous triumph. Classical tinsel made way, indeed, for romantic tinsel. The new art was as conventional as the old, but it had the advantage of being adaptable to the taste for show and splendour which characterizes the nation, and it also admitted the presentment of certain historical personages who survived in the memory of the people. The inevitable reaction from this theatrical art, with its affectation of noble sentiments, was to brutal realism. Baron Henry Leys (1815–1869) initiated it, and the crudity of his style gave rise to a belief in a systematic purpose of supplanting the Latin tradition by Germanic sentimentality. It would be interesting to trace how far the famous Belgian painter was influenced by the English artist Ford Madox Brown, whom he met at Antwerp while both were students. Still, as far as Leys was concerned, this reversion to realism was a matter of will rather than of study. His art is not that of a close observer; he lived in a dream of the period depicted by the masters of the past he delighted in. He himself was a master, a painter by nature, gifted with great powers of draughtsmanship, a firm hand, and a broad, rich sense of colour. As M. Camille Lemonnier has pointed out, it was his hatred of academical conventionality that lured Leys into a sort of wilful barbarism and a sometimes childish artlessness. Modern art was influenced by him to an extraordinary degree. He substituted for the mannered elegance of the so-called classical school, angular attitudes, coarse and common types, and the slow but determined temperament of a people caring little for external beauty and reserving its admiration for mental qualities. But it was soon recognized that there was a Teutonic as well as a Latin *recipe*, and Leys's archaic realism was transformed at Brussels into a realism of observation and modern thought, in the painting of Charles de Groux. The influence of Leys on this artist was merely superficial; for though he, too, affected painful subjects, it was because they appealed to his compassion. The principle represented by de Groux was destined to pioneer the school in a better way; at the same time, from another side the authority of Courbet, the French realist, who had been for some time in Brussels, and that of the great landscape painters of the Fontainebleau school, had suggested to artists a more attentive study of nature and a remarkable reversion in technique to bolder and firmer handling. At this time, among other remarkable men, Alfred Stevens appeared on the scene, the finished artist of whom Camille Lemonnier truly said that he was "of the race of great painters, and, like them, careful of finish"—that in him "the eye, the hand, and the brain all co-operated for the mysterious elaboration" of impasto, colour, and chiaroscuro, and "the least touch was an operation of the mind." A brief period ensued during which the greater number of Belgian artists were carried away by the material charms of brushwork and paint. The striving after brilliant effects of colour which had characterized the painters of the last generation then gave way to a devout study of values; and at the same time it is to be noted that in Belgium, as in France, landscape painters were the first to discover the possibility of giving new life to the interpretation of nature by simplicity and sincerity of expression. They tried to render their exact sensations; and we saw, as has been said, "an increasingly predominant revelation of instinctive feeling in all classes of painting." Artists took an impartial interest in all they saw, and the endeavour to paint well eliminated the hope of expressing a high ideal; they now sought only to utter in a work of art the impression made on them by an external fact; and, too often, the strength of the effort degenerated into brutality.

These new influences, which, in spite of the conservative school, had by degrees modified the aspect of Belgian art in general, led to the formation at Brussels of an association under the name of the Free Society of Fine Arts. This group of painters had a marked influence on the development of the school, and hand in hand with the pupils of Portaels—a teacher of sober methods, caring more for sound practice than for theories—it encouraged not merely the expression of deep and domestic feeling which we find in the works of Leys and de Groux, but also the endeavour to paint nature in the broad light of open air. The example of the Free Society found imitators; various artistic groups were formed to organize exhibitions where new works could be seen and studied irrespective of the influence of dealers, or of the conservatism of the authorities which was increasingly conspicuous in the official galleries; till what had at first been regarded as a mere audacious and fantastic demonstration assumed the dignity of respectable effort. The "Cercle des Vingt" ("The Twenty Club") also exerted a marked influence. By introducing into its exhibitions works by the greatest foreign artists, it released Belgian art from the uniformity which some too patriotic theorists would fain have imposed. The famous "principle of individuality in art" was asserted there in a really remarkable manner; for side by side with the experiments of painters bent on producing certain effects of light, hung the works of men who clung to literary or abstract subjects. Other groups, again, were formed on the same lines; but then came the inevitable reaction from these elaborations of quivering light and subtle expression, pushed, as it seemed, to an extreme. The youngest generation of Brussels painters, in revolt against the lights and ultra-refinements of their immediate predecessors, seem to take pleasure in a return to gums and bitumen, and to seek the violent effects so dear to the romantic painters of a past time.

Brussels is the real centre of art in Belgium. Antwerp, the home of Rubens, is resting on the memory of past glories, after vainly trying to uphold the ideal formerly held in honour by Flemish painters. And yet, so great is the prestige of this ancient reputation, that Antwerp even now attracts artists from every land, and more especially the dealers who go thither to buy pictures as a common form of merchandise. At Ghent the wonderful energy of the authorities who get up the triennial exhibitions makes these the most interesting provincial shows of their kind; other towns, as Liége, Tournay, Namur, Mons, and Spa, also have periodical exhibitions.

From 1830, in the early days of the Belgian school of painting, we may observe a tendency to seek for the fullest qualities of colour, with delicate gradations of light and shade. In this Wappers led the way. At a time when his teachers in the Antwerp Academy would recognize nothing but the heavy brown tones of old paintings, he was already representing the transparent shadows of natural daylight. But heroic and sentimental romanticism was already making way for the serious expression of domestic and popular feeling, and thenceforward the prominence assumed by genre, and yet more by landscape, led to a deeper and more direct study of the various aspects of nature. At the same time a special sense of colour was the leading characteristic of the artists of the time, and it was truly said that "the ambition to be a fine painter was stronger than the desire for scrupulous exactitude." Artists evidently aimed, in the first place, at a solid impasto and glowing colour; an undertone, ruddy and golden, gleamed through the paler and more real hues of the over-painting. In this we may certainly recognize the influence of the French colourists of Courbet's

time; just as we may trace the influence of the grey tone prevalent in Manet's day, in the effort to paint with more simple truth and fewer tricks of recipe, which became evident when the "Free Society" was founded at Brussels, and the pupils from Portaels' studio came to the front.

Among the artists who were then working, the following must be named (with their best works in the Brussels Gallery): Alfred Stevens (*q.v.*), an incomparably charming painter, characterized by exquisite harmony of colour and marvellous dexterity with the brush. In the Brussels Gallery are his "The Lady in Pink," "The Studio," "The Widow," "A Painter and his Model," and "The Lady-Bird." Joseph Stevens, his brother, a master-painter of dogs, broad in his draughtsmanship, and painting in strong touches of colour, is represented by "The Dog-Market," "Brussels—Morning," "A Dog before a Mirror"; Henri de Brækeleer, the nephew and pupil of Leys, a fine painter of interiors, in warm and golden tones, by "The Geographer," "A Farm—Interior," "A Shop"; Lievin de Winne, a portrait painter, sober in style and refined in execution, by "Leopold I., King of the Belgians"; Florent Willems, archaic and elegant, by "The Wedding-Dress"; Eugène Smits, a refined colourist, always working with the thought of Venice in his mind, by "The Procession of the Seasons"; Louis Dubois, a powerful colourist with a full brush, striving to resemble Courbet, by "Storks," "Fish"; Alfred Verwée, a fine animal painter, with special love for a sheeny silkiness of texture, by "The Estuary of the Scheldt," "The Fair Land of Flanders," "A Zeeland Team"; Alfred Verhaeren, a pupil of L. Dubois, by some "Interiors"; Felicien Rops, an extraordinary artist, precise in drawing, sensual, and incisive, by "A Parisienne"; Félix ter Linden, a restless, refined nature, always trying new subtleties of the brush and palette-knife, by "Captives." Amongst other painters may be named Camille van Camp, Gustave de Jonghe, Franz Verhas, and his brother Jan Verhas, the painter of the popular "School Feast" in the Brussels Gallery; and Jan van Beers, the clever and brilliant painter of female coquettishness, by pictures in the Antwerp Gallery.

As landscape painters, the chief are: Hippolyte Boulenger, a refined draughtsman and a delicate colourist, represented in the Brussels Gallery by "View of Dinant," "The Avenue of Old Hornbeams at Tervueren," "The Meuse at Hastière"; Alfred de Knyff, noble and elegant, by "The Marl Pit," "A Heath—Campine"; Joseph Coosemans, by "A Marsh—Campine"; Jules Montigny, by "Wet Weather"; Alph. Asselbergs, by "A Marsh—Campine." There are also Xavier and César de Cock, painters in light gay tones of colour, Gustave Den Duyts, a lover of melancholy twilight, represented in the same gallery by "A Winter Evening"; Mme Marie Collart, a seeker after the more melancholy and concentrated impressions of nature, by "The Old Orchard"; and Baron Jules Gœthals.

Of the *Antwerp school*, François Lamorinière, archaic and minute, has in the Brussels Gallery his "View from Edeghem," and there is also Théodore Verstraete, sentimental, or frenzied.

As marine painters: Paul Jean Clays, who delights in vivid effects of colour, is represented at Brussels by "The Antwerp Roadstead," "Calm on the Scheldt"; Louis Artan, who prefers dark and powerful effects, by "The North Sea," besides, Robert Mols, A. Bouvier, and Lemayeur.

As painters of town scenery may be named F. Stroobant, a draughtsman rather than a painter, who is represented in the Brussels Gallery by "The Grande Place at Brussels," and J. B. Van More, a colourist, chiefly by "The Cathedral at Belem."

The flower painter, Jean Robie, has in the Brussels Gallery "Flowers and Fruit."

Jean Portaels, the painter of "A Box at the Theatre," at Budapest, is represented in the Brussels Gallery by "The Daughter of Sion Insulted"; Émile Wauters, a master of free and solid brushwork, equally skilled in portraiture, historical composition, and decorative portrait painting, by "The Madness of Hugo van der Goes"; Édouard Agneesens, a genuine painter, with breadth of vision and facile execution, by Portraits; André Hennebicq, a painter of historical subjects, by "Labourers in the Campagna, Rome"; Isidore Verheyden, a landscapist and portrait painter, by "Woodcutters"; Eugène Verdyen and Émile Charlet should be mentioned, and the landscape painter Henri van der Hecht, whose "On the Sand-Hills" is in the Brussels Gallery.

The principal landscape painters of what is known as the "neutral tint" school (*l'École du gris*) are: Théodore Baron, faithful to the sterner features of Belgian scenery, represented in the Brussels Gallery by "A Winter Scene—Condroz"; Adrien Joseph Heymans, a careful student of singular effects of light, by "Spring-Time"; Jacques Rosseels, a painter of the cheerful brightness of the Flemish country, by "A Heath," besides Isidore Meyers and Florent Crabeels.

Some figure painters who may be added to this group are: Charles Hermans, whose picture "Dawn" (Brussels Gallery), exhibited in 1875, betrays the ascendancy of the principles upheld by the Free Society of Fine Arts; Jean de la Hoese, who has since made portraits his special line; Émile Sacré; Léon Philippet, represented in the Brussels Gallery by "The Murdered Man"; and Jan Stobbaerts, a masterly painter, powerful but coarse, by "A Farm—Interior."

Three more artists were destined to greater fame: Constantin Meunier, a highly respected artist, equally a painter and a sculptor, known as "the Millet of the Flemish workman," who has depicted with noble feeling his admiration and pity for one contemporary state of the human race, and who is represented in the Brussels Gallery by "The Peasants' War"; Xavier Mellery, who tries to express in works of high artistic merit the inner life of men and things, and personifications of thought, by "A Drawing"; and Alexandre Struys, a strong and clever painter, expressing his sympathy with poverty and misfortune in works of remarkable ability.

Besides these, Charles Verlat, a powerful and skilled artist, painted a vast variety of subjects; his teaching was influential in the Antwerp Academy. In the Brussels Gallery he is represented by "Godfrey de Bouillon at the Siege of Jerusalem," "A Flock of Sheep attacked by an Eagle"; Alfred Cluysenaar, whose aim is to produce decorative work on an enormous scale, by "Canossa"; Albrecht de Vriendt, by "Homage done to Charles V. as a Child"; Juliaan de Vriendt, by "A Christmas Carol"; Victor Lagye, by "The Witch." Franz Vinck, Wilhelm Geets, Karl Ooms, and P. van der Ouderaa, endeavour to perpetuate, while softening down, the style of historical painting so definitely formulated by Leys. Finally, Joseph Stallaert, a painter of classical subjects, is represented in the Brussels Gallery by "The Death of Dido." Eugène Devaux, a remarkable draughtsman, should also be named.

Works by all those artists were to be seen in the Historical Exhibition of Belgian Art at Brussels, 1880. Camille Lemonnier, in his *History of the Fine Arts in Belgium*, discussed this Exhibition very fully, pointing out three distinct periods in the history of the century. The first, romantic, literary, and artificial, extended from 1830 till nearly 1850; the second was a period of transition, domestic in feeling, gradually developing to realism in the course of about 20 years; the third began in the 'seventies, a time of careful study, especially in landscape. This was followed by the beginning of a fourth period, characterized by a freer sense of light and atmosphere.

Apart from the exclusive tendency, inevitable under bureaucratic administration, the mere arrangement, on an antiquated plan, of the great Academic Salons was unsuited to the display of works intended to represent individual feeling or peculiarities of pictorial treatment. Hence it was that a great many painters came to prefer smaller and more eclectic shows, leading to the fashion, which still persists, of exhibitions by clubs or associations. The Fine Arts Club at Brussels had long since afforded opportunities for showing the pictures of the Société Libre, founded in 1868, which were condemned by the authorities as tending to "revolutionize" art. After this, two associations of young painters were formed at Brussels with a view to organizing their own exhibitions.

The "*Chrysalide*" Club was founded in 1875, and the "*Essor*" (the "Soaring") Club, in 1876. In 1882, however, the *Essor* obtained leave to open their exhibition in a room in the Palais des Beaux Arts at Brussels. This tolerance was all the more appreciated by the younger party because a new departure was in course of development, again a modification in the effort to represent light in painting. The "neutral tint" school had given way to the school of "whiteness"; a luminous effect was to be sought by a free use of brilliant colour with a very full brush. But ere long this method proved unsatisfactory, and attention was now turned towards a "sincerer and acuter perception of local values"; and again the influence of certain French painters was brought to bear—those of the group headed by C. Monet, preparing for that of the French painter G. Seurat, the first who carried into practice the systematic decomposition of colour by the process known as *pointillisme* (the intimate juxtaposition of dots of colour). In 1884, in consequence of a division in the *Essor* Club, the "XX" Club was founded, who, though thus limiting their number, reserved the right of "issuing yearly invitations, and thus testifying the sympathy they felt with the most independent artists of Belgium and with those foreign painters with whom they had the most pronounced affinity." For ten years the exhibitions of the "XX," whose careful and artistic arrangements were in themselves admirable, were the fount in Belgium of discussions on art. The limit of its existence to ten years was determined when the club was formed; but as it was desirable that the principle of liberty in art should still be held in honour, M. Octave Maus, the secretary of the "XX" Club, organized the exhibitions of the *Libre Esthétique* in and since 1894. Other clubs had been formed in Brussels: the Fine Art Society in 1891 and "The Furrow" (*le Sillon*) in 1893. In 1894 another breach in the *Essor* Club, which, growing very weak, was soon to disappear, as the "Art Union" and the *Voorwaerts* Club had done, led to the formation of the Society "For Art" ("*pour l'Art*"); and in 1896 a party of that club established a Salon of idealist art which favoured an exaggeration of the intellectual tendency already

begun in the exhibitions of the "XX." Subsequently, in the exhibitions of the *Sillon* and of the *Labeur* Club (founded in 1898) a reaction set in, in favour of heavy brown tones and ponderous composition. At Antwerp the influence of the local societies—the "*Als Ik Kan*," the Independent Art Club, and the "XIII"—was less sensibly felt; it was, however, enough to confirm certain waverers in the direction of purely disinterested effort.

It would be impossible to classify into definite groups those painters whose first distinctive appearance was subsequent to the Historical Exhibition in 1880. Only an approximate grouping can be attempted by assigning each to the association in whose exhibitions he made the best display of what he aimed at expressing. Thus it was chiefly in the rooms of the *Essor* Club that works were shown by the following: L. Frédéric, a remarkable painter, combining wonderful facility of execution with a sincerely simple sentiment of homely pathos, represented at the Brussels Gallery by "Chalk Sellers"; E. Hoeterickx, a painter of crowds in the streets and parks; F. Seghers, a pleasing colourist, who had made flower-painting his speciality; two animal painters, F. van Leemputten, "Return from Work" (Brussels Gallery), and E. van Damme-Sylva, as well as the marine painter, A. Marcette. The landscape painters include J. de Greet, almost brutal in style, "The Pool at Rouge-Cloître" (Brussels Gallery), C. Wolles, and Hamesse. L. Houyoux, F. Halkett, L. Herbo are known for their portraits. And there are E. van Gelder, J. Mayné, A. Crespin, a learned decorative painter, and E. Duyck, a graceful draughtsman, "A Dream" (Brussels Gallery). As designers may be named A. Heins, a clever illustrator, and A. Lynen, of a thoroughly Brussels type, keenly observant and satirical.

At the exhibitions of the "XX" were pictures by the following: Fernand Khnopff ("Memories," a pastel, in Brussels Gallery), an admirer of the refined domesticity of English contemporary art, and of mystical art, as represented by Gustave Moreau; H. van der Velde, a well-known exponent of the new methods in applied art; J. Ensor, a whimsical nature, loving strange combinations of colour and inconsequent fancies (Brussels Gallery: "The Lamp-Man"); Th. van Rysselberghe, a clever painter, especially in the technique of dot painting (*pointillisme*); W. Schlobach, a remarkable colourist of uncertain tendencies; Henry de Groux, son of Ch. de Groux, a seer of visions represented in violent tones and workmanship; G. Vogels, a painter of thaw and rain; G. van Strydonck, R. Wytsman, J. Delvin, F. Charlet, Mlle A. Boch, all of whom have striven to bring light into their pictures; W. Finch and G. Lemmen.

To the Triennial Salons, to the exhibitions of the "Artistic" clubs, to the House of Art (*Maison d'Art*), at Brussels, and to the various Antwerp clubs, the following have contributed: F. Courtens, Rosseels' brilliant pupil, an astonishing painter with a heavy impasto (Brussels Gallery: "Coming Out of Church"); J. de Lalaing, full of lofty aims, but showing in his painting the qualities of a sculptor (Brussels Gallery: "A Prehistoric Hunter"); E. Claus, a lover of bright colour, and a genuine landscape painter (Brussels Gallery: "A Flock on the Road"); A. Baertsoen, who delights in the quiet corners of old Flemish towns; H. Evenepoel, a fine artist whose premature death deprived the Belgian school of a highly distinguished personality (Brussels Gallery: "Child at Play"); G. Vanaise, a painter of huge historical subjects; Ch. Mertens, a refined artist; E. Motte, an interesting painter with a love of archaic methods (Brussels Gallery: "A Girl's Head"); A. Lévêque, an accomplished draughtsman with a distinctive touch; L. Wolles, an admirable draughtsman; J. Leempoels, elaborate and minute; H. Richir, a portrait painter; J. van den Eeckhout, a clever pupil of Verheyden; J. Rosier, a skilful follower of Verlat; L. Abry, a painter of military subjects; E. Carpentier, E. Vanhove, Luyten, and Desmeth.

Essentially of the Antwerp school are F. van Kuyck, P. Verhaert, de Jans, and Brunin of Ghent, Ch. Doudelet, C. Montald, and van Biesbroeck.

There is a group of artists at Liége whose sincerity and high technical qualities have been recognized: A. Donnay, A. Rassenfosse, E. Berchmans, F. Marechal, Dewitte. Of lady painters: Mmes E. Beernaert, L. Héger, and J. Wytsman paint landscape. Mmes B. Art, A. Ronner, G. Meunier, and M. De Bièvre paint flowers. Mmes A. d'Anethan, Lambert de Rothschild, M. Philippson, H. Calais, and M. A. Marcotte paint figures and portraits.

The chief exhibitors at the Society *pour l'Art* are A. Ciamberlani, a painter of large decorative compositions in subdued tones; H. Ottevaere, a painter of night or twilight landscapes; O. Coppens, R. Janssens, and A. Hannotiau, who study old houses, deserted churches, and dead cities; F. Baes, an excellent pupil of Frédéric Fabry, O. and J. Dierickx, painters of decorative figures; H. Meunier, an ingeniously decorative draughtsman; J. Delville, founder of the Salons of Idealist art.

Leading exhibitors at the Voorwaerts Club have been E. Laermans, a strange artist, as it were a Daumier with anchylose joints, but a colourist (Brussels Gallery: "A Flemish Peasant"); V. Gilsoul, a clever pupil of Courtens (Brussels Gallery: "The Kennel"); J. du Jardin, the writer of *L'Art Flamand*, an important critical work illustrated by J. Middeleer.

Contributors to the exhibitions of the *Sillon* Club comprise G. M. Stevens, P. Verdussen, P. Matthieu, J. Gouweloos, Bastien, Blieck, Wagemans, and Smeers; and V. Mignot, ingenious in designing posters.

At the Exhibitions of Water Colours have been seen the works of Huberti, F. Bingé, V. Uytterschaut, Stacquet, and H. Cassiers, who work with light washes or a clever use of body colour; Hagemans, who paints with broad washes; Delaunois, the painter of mysterious interiors; Th. Lybaert, minute in his brushwork; M. Romberg and Titz, correct draughtsmen.

Since 1870 several important works of decorative painting in public buildings have been carried out in Belgium. Guffens, Swerts, and Pauwels have succumbed to the influences of German art, often cold and stiff; A. and J. Devriendt, V. Lagye, W. Geets, and Vander Onderaa have followed more or less in the footsteps of Leys. J. Stallaert has cleverly revived a classic style. Émile Wauters and A. Hennebicq have adopted the traditions of Historical Painting; and so too have L. Gallait, A. Cluysenaar, J. de Lalaing, and A. Bourland, though with a more decorative sense of conception and treatment. But of all these works, certainly the most remarkable in its artistic and intelligent fitness is that of M. Delbeke, in the market hall at Ypres.

HOLLAND.

The entire Impressionist movement of the end of the 19th century failed to exercise the slightest influence upon the Dutch. They are only modern in so far as they again resort to the classics of their Fatherland. For a whole generation Josef Israels was at the head of Dutch art. Born in 1827 at Groningen, the son of a money-changer, he walked every day in his early years, with a linen money-bag under his arm, to the great banking house of Mesdag, a son of which became later the famous marine painter. During his student days in Amsterdam he lived in the Ghetto, in the house of a poor but orthodox Jewish family. He hungered in Paris, and was derided as a Jew in the Delaroche school there. Such were the experiences of life that formed his character. In Zantvoort, the little fishing village close to Haarlem, he made a similar discovery to that which Millet had already made at Barbizon. In the solitude of the remote village he discovered that not only in the pages of history, but also in everyday life, there are tragedies. Having at first only painted historical subjects, he now began to depict the hard struggle of the seafaring man, and the joys and griefs of the poor. He commenced the long series of pictures that for thirty years and more occupied the place of honour in all Dutch exhibitions. They do not contain a story that can be rendered into words; they only tell the tale of everyday life. Old women, with rough, toil-worn hands and good-natured wrinkled faces, sit comfortably at the stove. Weatherbeaten seamen wade through the water, splashed by the waves as they drag along the heavy anchors. A peasant child learns how to walk by the aid of a little cart. Again, the dawning light falls softly upon a peaceful deathbed, on which an old woman has just breathed her last. A sad and resigned melancholy characterizes and pervades all his works. His toilers do not stand up straight; they are broken, without hope, and humble, and accomplish their appointed task without pleasure and without interest. He paints human beings upon whom the oppressions of centuries are resting; eyes that neither gaze on the present nor into the future, but back on to the long, painful past. A Jew, bearing the Ghetto yet in his bosom, is talking to us; and in his painting of the lowly and oppressed, he recounts the story of his own youth and the history of his own race.

The younger painters have divided Israels' subjects among them. Each has his own little field, which he tills and cultivates with industry and good sense; and paints one picture, to be repeated again and again during

his lifetime. Christoph Birschop, born in Friesland, settled as an artist in the land of his birth, where the national costumes are so picturesque, with golden chains, lace caps, and silver embroidered bodices. As in de Hoogh's pictures, the golden light streams through the window upon the floor, upon deep crimson table-covers; and upon a few silent human beings, whose lives are passed in dreamy monotony. Gerk Henkes paints the fogs of the canals, with boats gliding peacefully along. Albert Neuhuys selects simple family scenes, in cosy rooms with the sunlight peeping stealthily through the windows. Adolf Cortz, a pupil of Israels, loves the pale vapour of autumn, grey-green plains, and dusty country roads, with silvery thistles and pale yellow flowers. The landscape painters, also, have more in common with the old Dutch classic masters than with the Parisian Impressionists. There, on the hill, Rembrandt's windmill slowly flaps its wings; there Potter's cows ruminate solemnly as they lie on the grass. There are no coruscation and dazzling brightness, only the grey brownish mellowness that van Goyen affected. Anton Mauve, Jacob and Willem Maris, are the best known of the landscape men. Others are Mesdag, de Haas, Apol, Klinkenberg, Bastert, Blommers, de Kock, Bosboom, Ten Kate, du Chattel, Ter Meulen, Sande-Bakhuyzen. They all paint Dutch coast scenery, Dutch fields, and Dutch cattle, in excellent keeping with the old-master school, and with phlegmatic repose.

A few of the younger masters introduced a certain amount of movement into this distinguished, though somewhat somniferous, excellence. Breitner and Isaak Israels seem to belong rather to Manet's school than to that of Holland. The "suburb" pictures of W. Tholen, the flat landscapes bathed in light by Paul Joseph Gabriel, and Jan Veth's and Havermann's impressionistic portraits prove that, even among the Dutch, there are artists who experiment. Jan Toorop has even attained the proud distinction of being the *enfant terrible* of modern exhibitions, and his works appear to belong rather to the art of the old Assyrians than to the 19th century. But those who will endeavour to enter into their artistic spirit will soon discover that Toorop is deserving of more than a mere shrug of the shoulder; they will find that he is a great painter, who independently pursues original aims. At the present time all criticism of art is determined by the "line." All caprices and whims of the "line" are now ridden as much to death, and with the same enthusiasm, as were formerly those of "light." Toorop occupies one of the first places among those whose only aim consists in allowing the line to talk and make music. His astonishing power of physical expression may be noted. With what simple means, for example, he renders in his picture of the "Sphinx" all phases of hysterical desire; in that of "The Three Brides" nunlike resignation, chaste devotion, and unbridled voluptuousness. If his mastery over gesture, the glance of the eye, be remarked—how each feature, each movement of the hand and head, each raising and closing of the eyelid, exactly expresses what it is intended to express—Toorop's pictures will no more be scoffed at than those of Giotto, but he will be recognized as one of the greatest masters of the "line" that the 19th century has produced.

GERMANY.

The German school of painting, like that of France, entered on a new phase after the Franco-German war of 1870. An empire had been built up of the agglomeration of separate states. Germany needed no longer to gaze back admiringly at older and greater epochs. The historical painter became neglected. Not the heroic deeds of the past, but the political glories of the new empire were to be immortalized. This transition is particularly noticeable in the work of Adolf von Menzel. At the time of political stagnation he had recorded on his canvas the glories of Prussia in the past. Now that the present had achieved an importance of its own, he painted "The Coronation of King William at Königsberg" and "King William's Departure for the Army"; and ultimately he became the painter of popular subjects. The motley throng in the streets had a special fascination for him, and he loved to draw the crowd pushing its eager way to listen to a band on the promenade, in the market, at the doors of a theatre, or the windows of a café. He discovered the poetry of the builder's yard and the workshop. In the "Moderne Cyklopen" (Ironworks), painted in 1876, he left a monumental mark in the history of German art; for in this picture he depicts a simple incident in daily life, without any attempt at genre; and this was indeed the characteristic of his work for the next few years. Humorous anecdote, as represented by Knaus (b. 1829), Vautier (1829–1898), Defregger (b. 1835), and Grützner (b. 1846), found little acceptance. Serious representations of modern life were required; resort was made to all the expedients of the great painters, and the 'seventies were years of artistic study for Germany. Every great colourist in the past was thoroughly studied and his secrets discovered. In Germany, Wilhelm Leibl (b. 1844), holds the same prominent place that Courbet does in France. Leibl, like Courbet, (*q.v.*), showed that the task of painting is not to narrate, but to depict by the most convincing means at its disposal. He even went farther than Courbet in close scrutiny of nature. With loving patience he strove to translate into colour everything that his keen eye observed: he studied nature with the devotion of the mediæval artist. No feeling, strictly speaking, is discernible in his work. His greatest pictures are only of quiet life, with human accessories, and his painful accuracy divests his pictures of poetry. But when he first appeared, he was necessary. His painting of "Three Peasant Women in Church" is a grand documentary work of that period, whose first aim it was to conquer the picturesque. Leibl taught artists to study detail, to master the secrets of flower, leaf, and stalk.

A great number of pupils were encouraged by him to gain such a thorough mastery of every detail of technique as to be enabled to paint pictures that were thoroughly good in workmanship, irrespective of genre or anecdote. Among these, W. Trübner (b. 1851) stands pre-eminently as a painter. His works during the 'seventies are among the best painting done at Munich during that period; they are full and rich in colour, broad and bold in their treatment of the subject. A contemporary of his was Bruno Piglhein (b. 1848), a German Chaplin in this Courbet group, not heavy and matter-of-fact, but bold and witty. He revived the art of pastel painting and pointed the way to a new style in panoramic and decorative painting, whilst infusing beauty and grace into all his works.

The movement in applied arts which began at this time is also important. The revival of the German empire led to a renaissance in German taste. The "old German dwelling-rooms," which now became the fashion, could only be hung with pictures in keeping with the style of the old masters, and this entailed a closer study and imitation of their works than had hitherto been customary. Wilhelm Diez (b. 1839) is at the head of the group, and as well acquainted with the epoch from Dürer and Holbein to Ostade and Rembrandt as any art historian. In Harburger (b. 1846), Adrian Brouwer lived once more; and in Löfftz (b. 1845), Quintin Massys. Claus Meyer (b. 1846) imitated all the artistic tricks of Pieter de Hooch and Van

der Neer, of Delft. Holbein's costume studies were at first models for Fritz August Kaulbach (b. 1850). Later, he extended his studies to Dolci and Van Dyck, to Watteau and Gainsborough. Adolf Lier (1827–1882) applied the beauty of tone beloved by the old masters to landscape. Von Lenbach's works show the zenith of old-master talent in Germany. He had educated himself as a copyist of classical masterpieces, and passed through a schooling in the study of old masters such as none of his contemporaries had enjoyed. The copies which, as a young man, he made for Count Schach in Italy and Spain are among the best the brush has ever accomplished. Titian and Rubens, Velasquez and Giorgione, were imitated by him with equal success. In like manner he gave to his own works their distinguished old-master charm. More than all other painters of historical subjects, Lenbach enjoys the distinction of having been the historian of his epoch. He gave the great men of the era of the Emperor William I. the form in which they will live in German history, and beauty of colour is blended in all these pictures with their brilliant evidence of thought. The aspirations of a whole generation to restore the technique of the old masters found their realization in Lenbach.

Such was the position of things when there was imported from France the desire to paint light and sun. It was argued that the views which the old masters held concerning colour were in glaring contradiction to what the eye actually saw. The old masters, it was said, paid particular attention to the conditions of light and shade under which they did their work. The golden character of the Italian Renaissance was traceable to the old cathedrals lighted by stained-glass windows. The light and shade of the Netherlanders were in keeping with the light and shadow of the artists' studios lighted by little panes, and due partly to the fact that their pictures were intended to hang in dreamy, brown, panelled chambers. But was this golden or brown light suitable for the 19th century? Were we not illogical, when for the sake of reproducing the tones of the old masters, we darkened our studios and shut out the daylight by coloured glass windows and heavy curtains? Was not light one of the greatest acquisitions of recent times? When the Dutch painted, the world used only little panes of glass. Now the daylight streamed into our rooms through great white sheets of crystal. When our grandfathers lived, there were only candles and oil lamps. Now we had gas and electric light. Instead of imitating the old masters, let us paint the colouristic charms that were unknown to them. Let us do honour to the new marvels of colour. With such arguments as were advanced in France, did artists in Germany adopt the *plein-air* and abandon older methods; and a development like that which took place in France after the days of Manet ensued in Germany also. Daylight, which had so long been kept down, was now to be reproduced as clear and bright. After the art of painting strong effects full of daylight had been grappled with, other and more difficult problems of light effects were attempted. After the full blaze of sunshine had been successfully reproduced, such effects as the haze of early morning, the sultry vaporous atmosphere of the thunderstorm, the mysterious night, the blue-grey dawn, the delicate colours of variegated Chinese lanterns, the scintillation of gas and lamplight, and the dreamy twilight in the interior were dealt with.

Max Liebermann (b. 1849) was the first to join the new departure. In Paris he had learnt technique. Holland, the country of fogs, inspired him with the love for atmospheric effects, and its scenes of simple life, provided him with many subjects. Perhaps the "Net Menders" in the Hamburg Kunsthalle is most typical of Liebermann's art. Franz Skarbina (b. 1849), who was the second to join the new movement in Berlin, proceeded to studies of twilight and artificial light effects.

Hans Herrman (b. 1858), who settled himself on quays and ports; Hugo Vogel, who endeavoured to utilize scenes from contemporary life for decorative pictures; and the two landscape painters, Ludwig Dettmann (b. 1865) and Walther Leistikow (b. 1865), are other representatives of modern Berlin art. Carlsruhe, in the 'eighties, produced some modern pictures of great merit, when Gustav Schönleber (b. 1851) and Herrmann Baisch (b. 1846) showed daintily-conceived pictures of Dutch landscapes. In later years, Count Leopold Kalckreuth (b. 1855), whose powerfully-conceived representations of peasant life belong to the best productions of German realism, and Victor Weishaupt (b. 1848), the animal painter, removed thence to Stuttgart, the residence also of Otto Reiniger (b. 1863), a landscape painter of great originality. At Dresden we find Gotthard Kuehl (b. 1850), long domiciled in Paris, who was one of the first to accept Manet's teaching. In North Germany, Worpswede became a German Barbizon; Ende (b. 1860), Vogeler, and Vinnen (b. 1863) also worked there. In Weimar, two landscape painters of great refinement must be mentioned—Theodor Hagen (b. 1842) and Gleichen-Russwurm (b. 1866). As far back as the 'seventies they rendered ploughed fields, hills enveloped in thin vapour at sunrise, waving fields of corn, and apple trees in full bloom trembling in the rays of the evening glow, with a delicate understanding of natural effects.

But Munich still remains the headquarters of German art, which is there the first of all interests and pervades all circles. Almost all those who are working in other German towns received in that city their inspiration, and have indeed remained its citizens in heart. The International Exhibitions have given a great European tone and impulse to creative work. Among the elders, Albert von Keller (b. 1841) has perhaps the greatest originality. He is one of those who practised the art of the brush as long ago as the 'seventies, and painted, not for the sake of historical subjects or for genre, but for the sole love of his art. He painted everything, never restricted himself to any fixed programme, and never became trivial. He is perhaps in Germany the only painter of female portraits who has caught in his pictures a little of the charm that betrays itself in the expression and movements of the modern woman. In the works of Freiherr von Habermann (b. 1849) this refinement of sentiment, as expressed in colour, is combined with a still more decided shade of eccentricity. Already in his "Child of Sorrow," which hangs in the National Gallery at Berlin, he struck that painful chord that always remained his favourite. However different the subjects he has painted, a morbid note pervades them all.

In Heinrich Zügel (b. 1850), the Munich school possesses an animal painter who rivals the great Frenchmen in original power. Ludwig Dill (b. 1848), whom one must still count as "Dachauer," in spite of his migration to Carlsruhe, had for some time past been famous as a painter of Venice, the lagoons and Chioggia, when the impressionist movement became for him the starting-point of a new development. He strove for still brighter light, tried to realize the most subtle shades of colour, and raised himself from a painter of natural impressions to free and poetical lyricism. Arthur Langhammer (b. 1855), Ludwig Herterich, Leo Samberger (b. 1851), Hans von Bartels (b. 1856), Wilhelm Keller-Reutlinger (b. 1854), Beno Becker, Louis Corinth (b. 1858), Max Slevogt, are others that may be mentioned among the younger Munich artists.

Fritz von Uhde (b. 1848) occupies a peculiar position, as being the first to apply the principles of naturalism to religious art. Immediately before him, Eduard von Gebhardt (b. 1838) had gone back to the angular style of

the old northern masters, that of Roger van der Weyden and Albert Dürer, believing he could draw the old Biblical events closer to present times by relating them in Luther's language and representing them as taking place in the most powerful epoch of German ecclesiastical history. Now that historical paintings had been dispossessed by modern and contemporary subjects, it followed also that scenes from the life of Christ had to be laid in modern times. "I do not assert that only the commonplace occurrences of everyday life can be painted. If the historical past be painted, it should be represented in human garb corresponding to the life we see about us, in the surroundings of our own country, peopled with the people moving before our very eyes, just as if the drama had only been enacted the previous evening." Thus wrote Bastien-Lepage in 1879, when creating his "Jeanne d'Arc," and in this sense did Uhde paint. But besides the charm of feeling expressed in the subtlest hues, there is also the charm of the noble line.

At the time when, in England, Rossetti and Burne-Jones, and, in France, Puvis de Chavannes and Gustave Moreau, stepped into the foreground, in Germany Feuerbach (1829–1880), Marées (1837–1887), Thoma (b. 1839), and Böcklin (1827–1901) were discovered. Feuerbach's life was one series of privations and disappointments. His "Banquet of Plato," "Song of Spring," "Iphigenia" and "Pietà," and his "Medea" and "Battle of the Amazons," met with but scant recognition on their appearance. To some they appeared to lack sentiment, to others they were "not sufficiently German." When he died in Venice in 1880, he had become a stranger to his contemporaries. But posterity accorded him the laurel that his own age had denied him. Just those points in his pictures to which exception had been taken during his lifetime, the great solemn restfulness of his colouring and the calm dignity of his contours, made him appear contemporary.

Hans von Marées fulfilled a similar mission in the sphere of decorative art; his, likewise, was a talent that was not discovered until after his death. He is most in touch with Puvis de Chavannes. But the result was different. Puvis was recognized on his first appearance. Marées never had a chance of revealing his real strength. He was only 28 years of age when he first went to Rome; there, in 1873, he was commissioned to paint some pictures for the walls of the Zoological Station at Naples. After that time, nothing more was heard of him until 1891, when, four years after his death, the works he had left behind him were exhibited and presented to the gallery of Schleissheim. The value of these works of art must not be sought in their technique. The art of Puvis rests on a firm realistic foundation, but Marées had finished his studies of nature too prematurely for the correctness of his drawing. In spite of this defect, they encourage as well as excite, owing to the principle which underlies them, and which they share in equal degree with those of Puvis. Like Puvis, Marées repudiated all illuminating efforts whereby forms might be brought into relief. He only retained what was intrinsically essential, the large lines in nature, as well as those of the human frame.

Next to these artists stands Hans Thoma, like one of the great masters of Dürer's time. In Marées and Feuerbach's works there is the solemn grandeur of the fresco; in those of Thoma there is nothing of Southern loveliness, but something of the homeliness of the old German art of woodcut; nay, something philistine, rustic, patriarchal—the simplicity of heart and childlike innocence that entrance us in German folk-lore, in the paintings of Moritz von Schwind (1804–1871) and Ludwig Richter (1803–1884). He had grown up at Bernau, a small village of the Black Forest. Blossoming fruit-trees and silver brooks, green meadows and solitary peasants' cottages, silent valleys and warm summer evenings, grazing cattle and the cackle of the farmyard, all lived in his memory when he went to Weimar to study the painter's art. This pious faithfulness to the home of his birth and touching affection for the scenes of his childhood pervade all his art and are its leading feature. Even when depicting classical subjects, the mythological marvels of the ocean and centaurs, Thoma still remains the simple-hearted German, who, like Cranach, conceives antiquity as a romantic fairy tale, as the legendary period of chivalry.

Whether it be correct to place Böcklin (*q.v.*) in the same category with these painters, or whether he has a right to a separate place, posterity may decide. The great art of the old masters has weighed heavily upon the development of that of our own age. Even the idealists, who have been mentioned, trace their pedigree back to the old masters. However modern in conception, they are to all intents and purposes "old" as regards the form they employed to express their modern ideas. Böcklin has no ancestor in the history of art; no stroke of his brush reminds us of a leader. No one can think of tracing him back to the Academy of Düsseldorf, to Lessing, or Schorner, as his first teacher. Even less can he be called an imitator of the old masters. His works are the result of nature in her different aspects; they have not their origin in literary or historical suggestion. The catalogue of his conceptions, of landscape in varying moods, is inexhaustible. But landscape does not suffice to express his resources. Knights on the quest for adventure, Saracens storming flaming citadels, Tritons chasing the daughters of Neptune in the billowy waves; such were the subjects which appealed to him. He endowed all fanciful beings that people the atmosphere, that live in the trees, on lonely rocks, or that move and have their being in the slimy bottom of the sea, with body and soul, and placed a second world at the side of the world of actuality. Yet this universe of phantasy was too narrow for the master mind. If it be asked who created on the Continent of Europe the most fervid religious paintings of the 19th century; who alone exhausted the entire scale of sensations, from the placidity of repose to the sublimity of heroism, from the gayest laughter to tragedy; who possessed the most solemn and most serious language of form and, at the same time, the greatest poetry of colour—the name of Böcklin will most probably form the answer.

These masters were for their younger brethren the pioneers into a new world of art. It was momentous for the painter's art that in Germany, no less than in England and France, a new movement at this time set in—the so-called "arts and crafts." Hitherto the various branches of art had followed different courses. The most beautiful paintings were often hung in surroundings grievously lacking in taste. Now arose the ambition to make the room itself a work of art. The picture, as such, now no more stands in the foreground, but the different arts strive together to form a single piece of art. The picture is regarded as merely a decorative accessory.

Among the younger painters still to be mentioned, Max Klinger (b. 1857) is perhaps the most brilliant. He had begun with the etching-needle, and by its aid gave us entire novels, crisp little dramas of everyday life. But this realism was only a preliminary phase enabling him to pass on to a great independent art of form. His great picture, "Christ in Olympus," combines beauty of form with deep philosophical meaning. Ibsen in 1873, in his *Emperor and Galilean*, talked of a "third realm," combining heathen beauty with Christian profundity. Klinger's "Christ in Olympus" strikes the beholder as the realization of this idea. Stuck (b. 1853) shares with him the Hellenic serenity of form, the classical simplicity. Apart from this,

his pictures are thoroughly different. It might almost be said "Klinger is the Nazarene who stepped into Olympus"; the thoughtful, deep son of the North who carries profound physical problems into the beauty-loving Hellenic worship of the senses. Stuck's art is, also, almost classical in its insensibility and petrified coldness. In his first picture (1889), "The Guardian of Paradise," he painted a slim wiry angel, who, like Donatello's "St George," in calm confidence and self-assurance points the sword before him. And similar rigid figures, standing erect in steadiness—always portraits of himself—recur again and again in his works. Even his religious pictures—the "Pietà" and "The Crucifixion"—are, in reality, antique. One would seek in vain in them for the piety of the old masters or the Germanic fervour of Uhde. Grand in style and line, firm, solemn, serious in arrangement, they are yet hard and cold in conception.

Ludwig von Hoffmann (b. 1861) stands next to him, a gentle, dreamy German. In Stuck's work everything is strong and rugged: here all is soft and round. There the massiveness of sculpture and stiff heraldic lines: here all dissolved into variegated fairy tales, glowing harmonies. However classical he may appear, yet it is only the old yearning of the Germani for Hesperia—the song of Mignon—that rings throughout his works; the longing to emerge from the mist and the fog into the light, from the humdrum of everyday life into the remote fabulous world of fairydom, the longing to escape from sin and attain perfect innocence.

There are numerous others deserving of mention besides those already discussed. Josef Sattler, Melchior Lechter (b. 1871), and Otto Greiner (b. 1869), and likewise those who, such as von Berlepsch (b. 1852) and Otto Eckmann (b. 1865), devoted their energies again to "applied art."

AUSTRIA-HUNGARY.

In Austria the influence of Makart (1840–1884) was predominant in the school of painting during the last quarter of the 19th century. He personified the classical expression of an epoch, when a long period of colour-blindness was followed by an intoxication of colour. Whilst Piloty's ambition stopped short at the presentation of correct historical pictures, his pupil, Makart, felt himself a real painter. He does not interpret either deep thought or historical events, nor does he group his pictures together to suit the views of the art student. His work is essentially that of a colourist. Whatever his subject may be, whether he depicts "The Plague in Florence," "The Nuptials of Caterina Cornaro," "The Triumphal Entry of Charles V.," "The Bark of Cleopatra," or "The Five Senses," "The Chase of Diana," or "The Chase of the Amazons," his pictures are romances of brilliant dresses and human flesh. A few studies of the nude and sketches of colour, in which he merely touched the notes that were to be combined into chords, were the sole preliminaries he required for his historical paintings. Draperies, jewels, and voluptuous female forms, flowers, fruit, fishes, and marble—everything that is full of life and sensuous emotion, and shines and glitters, he heaps together into gorgeous still-life. And because by this picturesque sensuousness he restored to Austrian art a long-lost national peculiarity, his appearance on the scene was as epoch-making as if some strong power had shifted the centre of gravity of all current views and ideas.

In estimating Makart, however, we must not dwell on his pictures alone. He did more than merely paint—he lived them. Almost prematurely he dreamed the beautiful dream which in later days came nearer realization, that no art can exist apart from life—that life itself must be made an art. His studio, not without reason, was called his most beautiful work of art. Whithersoever his travels led him—to Granada, Algiers, or Cairo—he made extensive purchases, and refreshed his eye with the luscious splendour of rich silks and the soft lustrous hues of velvets. He made collections of carved ivory and Egyptian mummies, Gobelins, armour and weapons, old chests, antique sculpture, golden brocades with glittering embroideries, encrusted coverlets and the precious textures of the East, columns, pictures, trophies of all ages and all climes. He scattered money broadcast in striving to realize his dream of beauty—to pass one night, one hour, in the world of Rubens, so bright in colour, so princely in splendour.

Uniting as he did these artistic qualities in his own person—not only because he was a painter, but because in no other besides did the great yearning for æsthetic culture find such powerful utterance—Makart exercised an influence in Austria far transcending the actual sphere of the painter's art. An intense fascination went forth from the little man with the black beard and penetrating glance. At that time Makart dominated not merely Viennese art, but likewise the whole cultured life of the capital. Not only the Makart hat and the Makart bouquet made their pilgrimage through the world, he became also the motive power in all intellectual spheres. When Charlotte Wolter acted Cleopatra or Messalina on the stage, she not only wore dresses specially sketched for her by Makart, but she also spoke in Makart's style, just as Hamerling wrote in it. A veritable Makart fever, had, indeed, taken possession of Vienna. No other painter of the 19th century was so popular, the life of none other was surrounded by such princely sumptuousness. The scene when, during the festivals of 1879, he headed the procession of artists past the imperial box, mounted on a white steed glittering with gold, the Rubens hat with white feathers on his head, amidst the boisterous acclamations of the populace, is unique in the modern history of art. It is the greatest homage that a Philistine century ever offered an artist.

The life of August von Pettenkofen (1821–1889), who should, after Makart, be accounted the greatest Austrian painter of the last quarter of the 19th century, was passed much more modestly and serenely. He had grown up on one of his father's estates in Galicia, and had been a cavalry officer before becoming a painter. His place in Austria is that of Menzel in Germany. With Pettenkofen a new style appeared. The representation of modern subjects now began to take the place of historical painting, which had for so long a time been the ruling taste; not in the sense of the old-fashioned genre picture, but in that of artistic refined painting. Here, again, the distinctive Austrian note can be easily recognized. Pettenkofen's people are lazy, and yawn. All is contemplative and peaceful, full of dreamy, sleepy repose.

But neither Pettenkofen nor Makart has found followers. The great movement which, originating with Manet, took place in other centres of art, passed Austria by without leaving a trace. Hans Canon (b. 1829), who in his pictures transported the characters of the "Gründerzeit" to Venice of bygone days, and reproduced them as Venetian nobles and ladies of quality, is also a painter of note. So likewise is Rudolf Alt (b. 1812), still active with the brush in 1902, a refined painter in water-colours, who reproduces the beauties of Old Vienna in his subtle architectural sketches. Leopold Karl Müller (1834–1892), who had lived in Cairo with Makart, found his sphere of art in the variegated world of the Nile, and his ethnographical exactness, combined with his delicate colouring, made him for a long while much in request as a painter of Oriental

scenes, and a popular illustrator of Egyptological works. Emil Schindler was a great landscape painter, who often rose from faithful interpretation of nature to an almost heroic height. Heinrich von Angeli (b. 1840), again, furnished—as he continued to do—the European Courts with his representative pictures, combining refined conception with smooth elegant technique. These are the only artists who during the 'eighties rose above local mediocrity. After Makart died in 1884, the sun of Austrian art seemed to have set. Stagnation reigned supreme.

Only since the "Secession" from the old Society of Artists (*Künstlergenossenschaft*), which took place in 1896, has the former artistic life recommenced in Vienna. Theodor von Hermann, long domiciled in Paris, was the gifted initiator of the new movement, and succeeded in rousing a storm of discontent among the rising school of Viennese artists. They found a literary champion in their hero's father, who pleaded in eloquent language for a new Austrian culture. In November 1898 the Secessionists opened their first exhibition in a building erected by Josef Olbrück on the Wienerzeil. At first the importance of these exhibitions lay almost exclusively in the fact that the Viennese were thus given an opportunity of making acquaintance with the famous foreign masters, Puvis de Chavannes, Segantini, Besnard, Brangwyn, Meunier, Khnopff, Henri Martin, Vischer, who had until then been practically unknown in Austria, so that the public only then realized the inferiority of their countrymen's artistic work. Thus while acquainting the Viennese public with the strivings of European art, the Secession endeavoured at the same time to produce, in rivalry with foreigners, works of equal artistic merit. Leading foreign masters now joined the movement, and Vienna, which had so long stood aside, through inability to be represented worthily at international exhibitions, became once more a factor in contemporary European art.

Among the painters of the Secession, Gustav Klint possesses, perhaps, the most powerful original talent. Refined portraits, subtle landscapes, and decorative pictures, painted for the Tumba Palace and for the Vienna Hof Museum, first brought his name before the world. But he became famous in consequence of the controversy which arose around his picture, "Philosophy." He had been commissioned to paint the large ceiling piece for the "Aula" of the Vienna University, and instead of selecting a classical subject he essayed an independent work. The heavens open; golden and silvery stars twinkle; sparks of light gleam; masses of green cloud and vapour form clusters; naked human forms float about; a fiery head, crowned with laurel, gazes on the scene with large, serious eyes. Science climbs down to the sources of Truth: yet Truth always remains the inscrutable Sphinx. Klint paid the penalty of his bold originality by his work remaining dark and incomprehensible to most people. It has, notwithstanding, a historical importance for Austria corresponding to that which similar works of Besnard have for France. It embodies the first attempt to place monumental painting upon a purely colouristic basis, and to portray allegorical subjects as pure visions of colour. After Klint, Josef Engelhart (b. 1864) is deserving of notice. He is the true painter of Viennese life. On his first appearance his art was centred in his native place, and was strong in local colour, which was lacking in refinement. To acquire subtlety, he studied the great foreign masters and became a clever juggler with the brush, showing as much dexterity as any of them. Yet this virtuosity meant, in his case, only a good schooling, which should enable him to return with improved means to those subjects best suited to his talent. His works are artistic, but at the same time distinctly local.

Carl Moll (b. 1861) understands how to render with equal skill the play of light in a room and that of the sunbeams upon the fresh green grass. The rural pictures of Rist produce a fresh, cool, and sunny effect upon the eye; like a refreshing draught from a cool mountain spring—a piece of Norway on Austrian soil. Zettel's landscapes are almost too markedly Swiss in colour and conception. Julius von Kollmann worked a long time in Paris and London, and acquired, in intercourse with the great foreign painters—notably Carrière and Watts—an exquisitely refined taste, an almost hyperæsthetical sense for discreetly toned-down colour, and for the music of the line. In Friedrich König, M. von Schwindt's romantic vein is revived. Even the simplest scenes from nature appear under his hand as enchanted groves whispering secrets. Everything is true and, at the same time, dreamy and mysterious. The mythical beings of old German legends—dragons and enchanted princesses—peer through the forest thicket. Ernst Nowak (b. 1851), compared with him, is a sturdy painter, who knows his business well. He sings no delicate lyric. When one stands close by, his pictures appear like masonry—like reliefs. Seen from a distance, the blotches of colour unite into large powerful forms. Bernatzik understands how to interpret with great subtlety twilight moods—moonshine struggling with the light of street lamps, or with the dawn. Ticky followed Henri Martin in painting solemn forest pictures. Ferdinand André leans towards the austere power of Millet. He tells us in his work of labour in the fields, of bronzed faces and hands callous with toil; and especially must his charcoal drawings be mentioned, in which the colour overlays the forms like light vapour, and which, small as they are, have a sculptural effect. Auchentelier—known for his female studies—and Hänisch and Otto Friedrich (b. 1862), refined and subtle as landscape painters, must also be mentioned.

In rivalry with the Secession, the "Künstlergenossenschaft" has taken a fresh upward flight. Among figure painters, Delug, Goltz (b. 1857), Hirschl, and Veith are conspicuous; but still greater fascination is exercised by landscape painters such as Amesadan, Charlemont, &c., whose works show Austrian art in its most amiable aspect. Apart from Austrians proper, there are also representatives of the other nationalities which compose "the monarchy of many tongues." Bohemia takes the lead with a celebrity of European reputation—Gabriel Max (b. 1840), who, although of Piloty's school and residing in Munich, has never repudiated his Bohemian origin. The days of his youth were passed in Prague; and Prague, the mediæval, with its narrow winding alleys, is the most mysterious of all Austrian cities, enveloped in the breath of old memories and bygone legends. From this soil Max drew the mysterious fragrance that characterizes his pictures. His earliest work, the "Female Martyr on the Cross" (1867), struck that sweetly painful, half-tormenting, half-enchanting keynote that has since remained distinctively his. Commonplace historical painting received at Max's hands an entirely new *nuance*. The morbidness of the mortuary and the lunatic asylum, interspersed with spectres—something perverse, unnatural, and heartrending, —this is the true note of his art. His martyrs are never men—only delicate girls and helpless women. His colouring corresponds to his subjects. The sensations his pictures produce are akin to those which the sight of a beautiful girl lying in a mortuary, or the prison scene in *Faust* enacted in real life, might be expected to excite. He even applies the results of hypnotism and spiritualism to Biblical characters. In many of his pictures refinement in the selection of effects is missing. By over-production Max has himself vulgarized his art. Yet, despite his

manner of depicting the mysteries of the realms of shadows, and the intrusion of the spirit-world into realism, he remains a modern master. A new province—the spectral—was opened up by him to art.

Hans Schwaiger is the real *raconteur* of Bohemian legends. He, likewise, passed his youth in a small Bohemian village, over which old memories still brooded. In Hradec, places upon which the gallows had stood were still pointed out. The lonely corridors and passages of the ruined castle were haunted by the shades of its old possessors. This is the mood that led Schwaiger to legend-painting. But underlying his fairy tales there are the gallows or the alchemy of Faust. The landscape with its gloomy skies, the wooden huts, turrets, dwarfed trees—such are ever the accompaniments of his figures.

Of the younger generation of painters, Emil Orlick (b. 1870) seems to be the most versatile. Having acquired technique in Paris and Munich, he practically discovered Old Prague to the world of art. The dark little alleys of the ancient town, swarming with life compressed within their narrow compass, fascinated him. In order to retain and convey all the impressions that crowded in upon him in such superabundant plenitude, he learned how to use the knife of the wood-carver, the needle of the etcher, and the pencil of the lithographer. His studio more resembles the workshop of a printer than the atelier of a painter. In the field of lithography he has attained remarkable results. Orlick has also made his own everything that can be learned from the Japanese. Besides these masters, Albert Hynais, the creator of decorative pictures, almost Parisian in conception, must be mentioned. The landscape painters Wickener, Jansa, Slavicek, and Hudecek relate, in gentle melancholy tones of colour, the atmosphere and solitude of the wide plains of Bohemia.

In Poland, painting has its home at Cracow. Down to the year 1893 Johann Matejko was living there, in the capacity of director of the Academy. His pictures are remarkable for their originality and almost brutal force, and differ very widely from the conventional productions of historical painters. At the close of the 19th century Axentowicz, Olga Hojnanska, Mehoffer, Stanislawski, and Wyotkowski attracted attention. Although apparently laying much less stress on their Polish nationality than their Russian countrymen, their works proclaim the soul of the Polish nation, with its chivalrous gallantry and mute resigned grief, in a much purer form.

Hungary in the spring of 1899 lost him whom it revered as the greatest of its painters—Michael Munkacsy. Long before his death his brush had become idle. To the younger generation, which seeks different aims, his name has become almost synonymous with a wrongly-conceived old-masterly coloration, and with sensation painting and hollowness. "The Last Day of the Condemned Prisoner," his first youthful picture, contained the programme of his art. Then came "The Last Moments of Mozart," and "Milton dictating *Paradise Lost.*" These titles summon up before our eyes a period of all that is false in eclectic art, dominated by Delaroche and Piloty. Even the simple subjects of the Gospel were treated by Munkacsy in Piloty's meretricious style. "Christ before Pilate," "Ecce Homo," "The Crucifixion"—all these are gala representations, costume get-up, and, to that extent, a pious lie. But when we condemn the faults of his period, his personal merit must not be forgotten. When he first came to the fore, ostentation of feeling was the fashion. Munkacsy is, in this respect, the genuine son of the period. He was not one of those who are strong enough to swim against the stream. Instead of raising others to his level, he descended to theirs. But he has the merit of having painted spectacular scenes, such as the period demanded, with genuine artistic power. Like Rahl, Ribot, Roybet, and Makart, he was a *maître-peintre*, a born genius with the brush. Von Uhde and Liebermann were disciples of his school. And if these two painters have left that period behind them, and if independent natural sight has followed upon the imitation of the old masters, it is Munkacsy who enabled them to take the leap. (R. MR)

ITALY.

Modern Italy has produced one artist who towers over all the others, Giovanni Segantini (*q.v.*). Segantini owes as little to his period of study in Milan as Millet did to his sojourn at Delaroche's school. Both derived from their teachers a complete mastery of technique, and as soon as they were in possession of all the aids to art, they discarded them in order to begin afresh. Each painted what he had painted as a youth. They dwelt far from the busy world—Millet in Barbizon, Segantini at Val d'Albola, 5000 feet above the sea-level. They are equally closely allied in art. Millet, who rejected all the artifice of embellishment and perceived only beauty in things as they are, learned to see in the human body a heroic grandeur, in the movements of peasants a majestic rhythm, which none before him had discovered. Although representing peasants, his works resemble sacred pictures, so grand are they in their sublime, solemn simplicity. The same is true of Segantini's works. Like Millet, he found his vocation in observing the life of poor, humble people, and the rough grandeur of nature, at all seasons and all hours. As there is in Millet's, so also is there in Segantini's work a primitive, almost classical, simplicity of execution corresponding to the simplicity of the subjects treated. His pictures, with their cold silvery colouring, remind us of the wax-painting of old times and of the mosaic style of the Middle Ages. They are made up of small scintillating strokes; they are stony and look hard like steel. This technique alone, which touches in principle but not in effect, that of the *pointillistes*, permitted of his rendering what he wished to render, the stony crags of Alpine scenery, the thin scintillating air, the firm steel-like outlines. Finally, he passed from realistic subjects to thoughtful, Biblical, and symbolical works. His "Annunciation," the "Divine Youth," and the "Massacre of the Innocents" were products of an art that had abandoned the firm ground of naturalism and aimed at conquering supernatural worlds. This new aim he was unable to realize. He left the "Panorama of the Engadine," intended for the Paris Exhibition, in an unfinished state behind him. He died in his 42nd year, his head full of plans for the future. Modern Italy lost in him its greatest artist, and the history of art one of the rare geniuses.

Few words will suffice for the other Italian painters. The soil that had yielded down to Tiepolo's days such an abundant harvest was apparently in need of rest during the 19th century. At the Paris Exhibition of 1867 About called Italy "the tomb of art," and indeed until quite recent times Italian painting has had the character of mere pretty saleable goods. Francesco Vinea, Tito Conti, and Frederigo Andreotti painted with tireless activity sleek drapery pictures, with Renaissance lords and smiling Renaissance ladies in them. Apart from such subjects, the comic, genre, or anecdote ruled the fashion—somewhat coarse in colour and of a merrier tendency than is suitable for pictures of good taste. It was not until nearly the end of the 19th century that there was an increase in the number of painters who aim at real achievement. At the Paris Exhibition of 1900 only Detti's "Chest" and Signorini's "Cardinal" pictures reminded one of the comedy subjects formerly in vogue. The younger masters employ neither

"drapery-mummeries" nor spicy anecdote. They paint the Italian country people with refined artistic discernment, though scarcely with the naturalism of Northern nations. Apparently the calm, serious, ascetic, austere art initiated by Millet is foreign to the nature of this volatile, colour-loving people. Southern fire and delight in brilliant hues are especially characteristic of the Neapolitans. A tangle of baldacchinos, priests and choir boys, peasants making obeisance and kneeling during the passing of the Host, weddings, horse-races, and country festivals, everything sparkling with colour and glowing in Neapolitan sunlight—such are the contents of Paolo Michetti's, Vincenzo Capri's, and Edoardo Dalbono's pictures. But Michetti, from being an adherent of this glittering art, has found his way to the monumental style. The Venetians acknowledge and honour as their leader Giacomo Favretto, who died very young. He painted drapery pictures like most artists of the 'eighties, but they were never lackadaisical, never commonplace. The Venice of Canaletto and Goldoni, the magic city surrounded by the glamour of bygone splendour, rose again under Favretto's hands to fairylike radiance.

The older masters, Signorini, Tito Tommasi, Dall 'oca Branca, who depict the Piedmontese landscape, the light on the lagoons, and the colour charm of Venetian streets with so refined a touch, have numerous followers, whose pictures likewise testify to the seriousness that again took possession of Italian painters after a long period of purely commercial artistic industry. Side by side with these native Italians two others must be mentioned, who occupy an important place as interpreters of Parisian elegance and French art-history. Giuseppe de Nittis (born in Naples; died in Paris 1884) was principally known by his representations of French street life. The figures that enlivened his pictures were as full of charm as his rendering of atmospheric effects was refined. Giovanni Boldini, a Ferrarese living in Paris, also painted street scenes, full of throbbing life. But he excelled, besides, as a portrait-painter of ladies and children. He realized the aim of the Parisian Impressionists, which was to render life, and not merely mute repose. He understood in a masterly fashion how to catch the rapid movement of the head, the fleetest expression, the sparkling of the eye, a pretty gesture. From his pictures posterity will learn as much about the sensuous life of the 19th century as Greuze has told us about that of the 18th.

Among those who have been the leaders of modern Italian art, not already mentioned, are Domenico Morelli, Giovanni Costa, landscape painter; Sartorio, an Italian Pre-Raphaelite; Pasini, painter of the East; Muzzioli, a follower of Alma-Tadema; Barabino, historical painter; and most striking and original of all, Monticelli, whose glow of colours was often obtained, not only by palette-knife painting, but by squeezing the colour straight from the tubes on to the canvas.

SPAIN AND PORTUGAL.

Modern Spanish painting began with Mariano Fortuny (*q.v.*), who, dying as long ago as 1874, nevertheless left his mark even on the following generation of artists. During his residence in Paris in 1866 he had been strongly influenced by Meissonier, and subsequently selected similar subjects—scenes in 18th-century costume. In Fortuny, however, the French painter's elaborate finish is associated with something more intense and vivid, indicative of the southern Latin temperament. He collected in his studio in Rome the most artistic examples of mediæval industry. The objects among which he lived he also painted with incisive spirit as a setting for elegant figures from the world of Watteau and of Goya, which are thrown into his pictures with amazing dash and sparkle; and this love of dazzling kaleidoscopic variety has animated his successors. Academic teaching tries to encourage historical painting. Hence, since the 'seventies, the chief paintings produced in Spain have been huge historical works, which have made the round of European exhibitions and then been collected in the Gallery of Modern Art at Madrid. There may be seen "The Mad Queen Juana," by Pradilla; "The Conversion of the Duke of Gandia," by Moreno Carbonero; "The Bell of Huesca," by Casado; "The Last Day of Numantia," by Vera; "Ines de Castro," by Cabello.

It is possible, of course, to discern in the love of the horrible displayed in these pictures an element of the national character, for in the land of bull-fights even painting turns to murder and sudden death, poison and the rope. However, at least we must admit the great power revealed, and recognize the audacious colouring. But in point of fact these works are only variants on those executed in France from the time of Delaroche to Jean Paul Laurens, and tell their story in the style that was current in Parisian studios in the 'sixties. What is called the national garb of Spain is mainly the cast-off fashion of Paris. After all this magniloquent work Fortuny's rococo became the rage. The same painters who had produced the great historical pictures were now content to take up a brilliant and dazzling miniature style; either, like Fortuny himself, using small and motley figures in baroque subjects, or adapting the modern national life of Spain to the rococo style.

Here again we observe the acrobatic dexterity with which the painters, Pradilla especially, use the brush. But here again there is nothing essentially new—only a repetition of what Fortuny had already done twenty years before. The Spanish school, therefore, presented a very old-fashioned aspect at the Paris Exhibition of 1900. The pictures shown there were mostly wild or emotional. Bedouins fighting, an antique quadriga flying past, the inhabitants of Pompeii hastily endeavouring to escape from the lava torrent, Don Quixote's Rosinante hanging to the sail of the windmill, and the terrors of the Day of Judgment were the subjects; Alvarez Dumont, Benlliure y Gil, Ulpiano Checa, Manuel Ramirez Ibañez, and Morena Carbonero were the painters. Among the huge canvases, a number of small pictures, things of no importance, were scattered, which showed only a genre-like wit. Spain is a somewhat barren land in modern art. There painting, although active, is blind to life and to the treasures of art which lie unheeded in the road. Only one artist, Agrasot, during the 'seventies painted pictures of Spanish low life of great sincerity; and much later two young painters appeared who energetically threw themselves into the modern movement. One was Sorolla y Bastida, by whom there is a large fishing picture in the Luxembourg, which in its stern gravity might be the work of a Northern painter; the other was Ignacio Zuloaga, in whom Goya seems to live again. Old women, girls of the people, and *cocottes* especially, he has painted with admirable spirit and with breadth. Spain, which has taken so little part in the great movement since Manet's time, only repeating in old-fashioned guise things which are falsely regarded as national, seems at last to possess in Zuloaga an artist at once modern and genuinely national.

Portugal took an almost lower place in the Paris Exhibition. For whereas the historical Spanish school has endeavoured to be modern to some extent, at least in colour, the Portuguese cling to the blue-plush and red-velvet splendours of Delaroche in all their crudity. Weak pictures of monks and of visions are produced in numbers, together with genre pictures depicting the popular life

of Portugal, spiced to the taste of the tourist. There are the younger men who aim at availing themselves of the efforts of the open-air painters; but even as followers of the Parisians they only say now what the French were saying long years ago through Bastien-Lepage, Puvis de Chavannes, and Adrien Dumont. There is always a Frenchman behind the Portuguese, who guides his brush and sets his model. The only painter formed in the school is Carlos Reis, whose vast canvas "Sunset" has much in common with the first huge peasant pictures painted in Germany by Count Kalckreuth. One painter there is, however, who is quite independent and wholly Portuguese, a worthy successor of the great old masters of his native land, and this is Columbano, whose portraits of actors have a spark of the genius which inspired the works of Velasquez and Goya. (R. MR.)

Denmark.

Denmark resembles Holland in this: that in both, nature presents little luxury of emphasized colour or accentuated majesty of form. Broad flats are everywhere to be seen—vague, almost indefinable, in outline. Danish art is as demure and staid as the Danish landscape. As in Holland, the painters make no bold experiments, attempt no pretentious subjects, no rich colouring, nothing sportive or light. Like the Dutch, the Danes are somewhat sluggishly tranquil, loving dim twilight and the swirling mist. But Denmark is a leaner land than Holland, less moist and more thinly inhabited, so that its art lacks the comfortable self-satisfied character of Dutch art. It betrays rather a tremulous longing, a pleasing melancholy and delight in dreams, a trembling dread of contact with coarse and stern reality. It was only for a time, early in the 'seventies, that a touch of cosmopolitanism affected Danish art. The phase of grandiose historical painting and anecdotic genre was experienced there, as in every other country. In Karl Bloch (b. 1834), Denmark had a historical painter in some respects parallel with the German Piloty; in Axel Helsted (b. 1847), a genre painter reminding us of Ludwig Knaus. The two artists Laurits Tuxen (b. 1853) and Peter Kröyer (b. 1851), who are most nearly allied to Manet and Bastien-Lepage, have a sort of elegance that is almost Parisian. Kröyer, especially, has bold inventiveness and amazing skill. Open-air effects and twilight moods, the glare of sunshine and artificial light, he has painted with equal mastery. In portraiture, too, he stands alone. The two large pictures in which he recorded a "Meeting of the Committee of the Copenhagen Exhibition, 1887," and a "Meeting of the Copenhagen Academy of Sciences," are modern works which in power of expression may almost compare with those of Frans Hals. Such versatility and facile elegance are to be found in no other Danish painter. At the period of historic painting it was significant that next to Bloch, the cosmopolitan, came Kristian Zahrtmann (b. 1843), who painted scenes from the life of Eleonora Christina, a Danish heroine (daughter of Christian IV.), with the utmost simplicity, and without any emotional or theatrical pathos. This touching feeling for home and country is the keynote of Danish art. The Dane has now no sentiment but that of home; his country, once so powerful, has become but a small one, and has lost its political importance. Hence he clings to the little that is left to him with melancholy tenderness. Viggo Johansen (b. 1851), with his gentle dreaminess, is the best representative of modern Danish home-life. He shows us dark sitting-rooms, where a quiet party has met around the tea-table. "An Evening at Home," "The Christmas Tree," "Grandmother's Birthday," are typical subjects, and all have the same fresh and fragrant charm. He is also one of the best Danish landscape painters. The silvery atmosphere and sad, mysterious stillness of the island-realm rest on Johansen's pictures. Not less satisfactory in their little world are the rest: Holsöe (b. 1866), Lauritz Ring (b. 1854), Haslund, Syberg (b. 1862), Irminger (b. 1850), and Ilsted paint the pleasant life of Copenhagen. In Skagen, a fishing town at the extreme end of Jutland, we find painters of sea life: Michael Ancher (b. 1849), Anna Ancher (b. 1859), and C. Locher (b. 1851). The landscape painters Viggo Pedersen (b. 1854), Philipsen (b. 1840), Julius Paulsen (b. 1860), Johan Rohde (b. 1856) have made their home in the villages round Copenhagen. Each has his own individuality and sees nature with his own eyes, and yet in all we find the same sober tone, the same gentle, tearful melancholy. The new Idealism has, however, been discernible in Denmark. Joakim Skovgaard (b. 1856), with his "Christ among the Dead" and "Pool of Bethesda," is trying to endow Denmark with a monumental type of art. Harald Slott-Möller (b. 1864) and J. F. Willumsen (b. 1863) affect a highly symbolical style. But even more than these painters, who aim at reproducing ancient folk-tales through the medium of modern mysticism, two others claim our attention, by the infusion into the old tradition of a very modern view of beauty approaching that of Whistler and of Carrière: one is Ejnar Nielsen, whose portraits have a peculiar, refined strain of gentle Danish melancholy; the other, V. Hammershöj, who has an exquisite sense of tone, and paints the magical effect of light in half-darkened rooms. Among the more noteworthy portrait painters, Aug. Jerndorff and Otto Bache should be included; and among the more decorative artists, L. Frölich. Hans Tegner is the greatest illustrator of the day. (R. MR.)

Sweden.

There is as great a difference between Danish and Swedish art as between Copenhagen and Stockholm. Copenhagen is a homely provincial town, and life is confined to home circles. In Stockholm we find the whirl of life and all the elegance of a capital. It has been styled the Paris of the North, and its art also wears this cosmopolitan aspect. Düsseldorf, where in the 'sixties most painters studied their art, appeared to latter-day artists too provincial. Munich and, to a still greater extent, Paris became their "Alma Mater." Salmson (1843–1894) and Hagborg (b. 1852), who were first initiated into naturalism in Paris, adopted this city for a domicile. They paint the fishermen of Brittany and the peasants of Picardy; and even when apparently interpreting Sweden, they only clothe their Parisian models in a Swedish garb. Those who returned to Stockholm turned their Parisian art into a Swedish art, but they have remained cosmopolitan until this day. Whilst there is something prosy and homely about Danish art, that of Sweden displays nervous elegance and cosmopolitan polish. Simplicity is in her eyes humdrum; she prefers light and brilliant notes. There, a naturalness and simplicity allow us to forget the difficulties of the brush: here, we chiefly receive the impression of a cleverly solved problem. There, the greatest moderation in colour, a soft all-pervading grey: here, a cunning play with delicate tones and gradations—a striving to render the most difficult effects of light with obedient hand. This tendency is particularly marked in the case of the landscape painters: Per Ekström (b. 1844), Niels Kreuger (b. 1858), Karl Nordström (b. 1865), Prince Eugen (of Sweden, b. 1865), Axel Sjöberg Wallander (b. 1862), and Wahlberg (b. 1864). Nature in Sweden has not the idyllic softness, the veiled elegiac character, it displays in Denmark. It is more coquettish, southern, and French, and the painters regard it also with French eyes.

As a painter of animals, Bruno Liljefors (b. 1860) created a sensation by his surprising pictures. Whatever his subjects—quails, capercailzies, dogs, hares, magpies, or thrushes—he has caught the fleetest motions and the most transitory effects of light with the cleverness of a Japanese. With this exception, the Swedish painters cannot be classified according to "subjects." They are "virtuosi," calling every technical aspect of art their own—as well in fresco as in portrait painting. Oscar Bjórek (b. 1860), Ernst Josephson (b. 1851), Georg Pauli (b. 1855), Richard Bergh (b. 1858), Hanna Hirsch (now Pauli, b. 1864), are the best-known names. Carl Larsson's (b. 1853) decorative *panneaux* fascinate by their easy lightness and coquettish grace of execution. Ander Zorn (b. 1860), with his dazzling virtuosity, is as typical of Swedish as the prosaic simplicity of Johansen is of Danish art. His marine pictures, with their undulating waves and naked forms bathed in light, belong to the most surprising examples of the cleverness with which modern art can stereotype quivering motions; and the same boldness in handling his subjects, which triumphs over difficulties, makes his "interiors," his portraits and etchings, objects of admiration to every painter's eye. In his "Dance before the Window" all is vivacity and motion. His portrait of a "Peasant Woman" is a powerful harmony of sparkling yellow-red tones of colour. Besides these older masters who cleave to the most dazzling light effects, there are the younger artists of the school of Carl Larsson, who aspire more to decorative effects on a grander scale. Gustav Fjälstad (b. 1868) exhibited a picture in the Paris Exhibition of 1900 that stood out like mosaic among its surroundings. And great similarity in method has Hermann Normann, who, as a landscape painter, also imitates the classic style. (R. MR.)

NORWAY.

We enter a new world when in picture galleries we pass to the Norwegian from the Swedish section. From the great city we are transported to nature, solemn and solitary, into a land of silence, where a rude, sparse population, a race of fishermen, snatches a scanty sustenance from the sea. The Norwegians also contributed for a time to the international market in works of art. They sent mainly genre pictures telling of the manners and customs of their country, or landscapes depicting the phenomena of Northern scenery. Adolf Tidemand (1814–1876) introduced his countrymen—the peasants and fishermen of the Northern coast—to the European public. We are introduced to Norwegian Christmas customs, accompany the Norseman on his nocturnal fishing expeditions, join the "Brudefærd" across the Hardanger fjord, sit as disciples at the feet of the Norwegian sacristan. Ferdinand Fagerlin (b. 1825) and Hans Dahl are two other painters who, educated at Düsseldorf and settled in Germany, introduced the style of Knaus and Vautier to Norwegian art circles. Knud Badde (1808–1879), Hans Gude (b. 1825), Niels Bjórnsen Möller, Morten-Müller (b. 1828), Ludvig Munthe (1843–1896), and Adelsten Normann (b. 1848) are known as excellent landscape painters, who have faithfully portrayed the majestic mountain scenery and black pine forests of their native land, the cliffs that enclose the fjords, and the sparkling snowfields of the land of the midnight sun. But the time when actuality had to be well seasoned, and every picture was bound to have a spice of genre or the attraction of something out of the common to make it palatable, is past and gone. As early as the 'sixties Björnson was president of a Norwegian society which made it its chief business to wage war against the shallow conventionalities of the Düsseldorf school. Ibsen was vice-president. In the works of the more modern artists there is not a single trace of Düsseldorf influence. Especially in the 'eighties, when naturalism was at its zenith, we find the Norwegians its boldest devotees. They portrayed life as they found it, without embellishment; they did not trouble about plastic elegance, but painted the land of their home and its people in a direct, rough-hewn style. Like the people we meet in the North, giants with stalwart iron frames, callous hands, and sunburnt faces, with their sou'-westers and blue blouses, who resemble sons of a bygone heroic age, have the painters themselves—notably Niels Gustav Wentzel (b. 1859), Svend Jórgensen (b. 1861), Kolstœ (b. 1860), Christian Krohg—something primitive in the directness, in, one might almost say, the barbarous brutality with which they approach their subjects. They preferred the most glaring effects of *plein-air*; they revelled in all the hues of the rainbow.

But these very uncouth fellows, who treated the figures in their pictures with such rough directness, painted even in those days landscapes with great refinement; not the midnight sun and the precipitous cliffs of the fjords, by which foreigners were sought to be impressed, but austere, simple nature, as it lies in deathlike and spectral repose—lonely meres, whose surface is unruffled by the keel of any boat, where no human being is visible, where no sound is audible; the hour of twilight, when the sun has disappeared behind the mountains, and all is chill and drear; the winter, when an icy blast sweeps over the crisp snowfields; the spring, almost like winter, with its bare branches and its thin young shoots. Such were their themes, and painters like Amaldus Nilsen (b. 1838), Eilif Petersen (b. 1852), Christian Skredsvig (b. 1854), Fritz Thaulow (b. 1848), and Gerhard Munthe (b. 1849) arrested public attention by their exhibition of pictures of this character.

Latterly these painters have become more civilized, and have emancipated themselves from their early uncouthness. Jörgensen, Krohg, Kolstœ, Soot, Gustav Wentzel, no longer paint those herculean sailors and fishermen, those pictures of giants that formerly gave to Norwegian exhibitions their peculiar character. Elegance has taken possession of the Norwegian palette. This transformation began with Fritz Thaulow, and indeed his art threatened to relapse somewhat into routine, and even the ripples of his waters to sparkle somewhat coquettishly. Borgen (b. 1852), Hennig (b. 1871), Hjerlów (b. 1863), and Stenersen (b. 1862) were gifted recruits of the ranks of Norwegian painters, whilst Halfdan Strom (b. 1863), who depicts rays of light issuing from silent windows and streaming and quivering over solitary landscapes, dark blue streams and ponds, nocturnal skies, variegated female dresses, contrasting as spots of colour with dark green meadows, has a delicacy in colouring that recalls Cazin. Gerhard Munthe, who, as we have seen, first made a name by his delicate vernal scenery, has turned his attention to the classical side of art; and, finally, Erik Werenskjold (b. 1855), who was also first known by his landscapes and scenes of country life, afterwards gained success as an illustrator of Norwegian folk-lore. (R. MR.)

RUSSIA.

Until late in the 19th century modern Russian painting was unknown to western Europe. What had been seen of it in international exhibitions showed the traditions of primitive European art, with a distinct vein of barbarism. In the early 'fifties, painters were less bent on art than on political agitation; they used the brush as a means of propaganda in favour of some political idea. Peroff showed us the miserable condition of the serfs, the wastefulness and profligacy of the nobility. Vereschagin made himself the advocate of the soldier, painting the horrors of war long before the Tsar's manifesto preached universal disarmament. Art suffered from this praiseworthy

misapplication; many pictures were painted, but very few rose to the level of modern achievement in point of technique. It was only by the St Petersburg art journal *Mir Iskustwa*, and by a small exhibition arranged at Munich in 1892 by a group of Russian landscape painters, that it was realized that a younger Russian school had arisen, fully equipped with the methods of modern technique, and depicting Russian life with the stamp of individuality. At the Paris Exhibition of 1900 the productions of this young Russian school were seen with surprise. A florescence similar to that which literature displayed in Pushkin, Dostoiefsky, and Tolstoy seemed to be beginning for Russian painting. Some of these young painters rushed into art with unbridled zest, painting with primitive force and boldness. They produced historical pictures, almost barbaric but of striking force; representations of the life of the people full of deep and hopeless gloom; the poor driven by the police and huddled together in dull indifference; the popes tramping across the lonely steppes, prayer-book in hand; peasants muttering prayers before a crucifix. There is great pathos in "The Karamasow Brothers," or "The Power of Darkness." At the same time we feel that a long-inherited tradition pervades all Russia. We find a characteristic ecclesiastical art, far removed from the productions of the *fin de siècle*, in which the rigid tradition of the Byzantines of the 3rd century still survives. And, finally, there are landscapes almost Danish in their bloodless, dreamy tenderness. Among the historical painters Elias Repin is the most impressive. In his pictures, "Ivan the Cruel," "The Cossacks' Reply to the Sultan," and "The Miracle of Saint Nicholas," may be seen—what is so rare in historical painting—genuine purpose and style. Terror is rendered with Shakespearean power; the boldness with which he has reconstituted the past, and the power of pictorial psychology which has enabled him to give new life to his figures, are equally striking in "Sowing on the Volga" and "The Village Procession." He was the first to paint subjects of contemporary life, and the work, while thoroughly Russian, has high technical qualities—the sense of oppression, subjection, and gloom is all-pervading. But he does not "point the moral," as Peroff did; he paints simply but sympathetically what he sees, and this lends his pictures something of the resigned melancholy of Russian songs. Even more impressive than Repin is Philippe Maliavine. He has rendered peasants, stalwart figures of powerful build and, in a picture called "Laughter," Macbeth-like women, wrapped in rags of fiery red, are thrown on the canvas with astonishing power. Among religious painters Victor Vasnezoff, the powerful decorator of the dome in the church of St Vladimir at Kieff, is the most distinguished figure. These paintings seem to have been executed in the very spirit of the Russian Church; blazing with gold, they depend for much of their effect upon barbaric splendour. But Vasnezoff has painted other things: "The Scythians," fighting with lance and battle-axe; horsemen making their way across the pathless steppe; and woods and landscapes pervaded by romantic charm, the home of the spirits of Russian legend. Next to Vasnezoff is Michael Nesteroff, a painter also of monks and saints, but as different from him as Zurbaran from the mosaic workers of Venice; and Valentin Seroff, powerful in portraiture and fascinating in his landscape. It is to be remarked that although these artists are austere and unpolished in their figure-painting, they paint landscape with delicate refinement.

Schischkin and Vassilieff were the first to paint their native land in all simplicity, and it is in landscape that Russian art at the present time still shows its most pleasing work. Savrassoff depicts tender spring effects; Kuindshi light birch-copses full of quivering light; Sudkovski interprets the solemn majesty of the sea; Albert Benois paints in water-colour delicate Finnish scenery; Apollinaris Vasnezoff has recorded the dismal wastes of Siberia, its dark plains and endless primeval forest, with powerful simplicity.

A special province in Russian art must be assigned to the Poles. It is difficult indeed to share to the full the admiration felt in Warsaw for the Polish painters. It is there firmly believed that Poland has a school of its own, owing nothing to Russia, Austria, or Germany; an art which embodies all the chivalry and all the suffering of that land. The accessories are Polish, and so are the costumes. Jan Chelminski, Wojcliech Gerson, Constantine Gorski, Apolonius Kendzrierski, Joseph Ryszkievicz, and Roman Szvoinicki are the principal artists. We see in their pictures a great deal of fighting, a great deal of weeping; but what there is peculiar to the Poles in the expression or technique of their works it is hard to discover.

Finland, on the other hand, is thoroughly modern. Belonging by descent to Sweden rather than to Russia, its painters' views of art also resemble those of the "Parisians of the North." They display no ungoverned power, but rather supple elegance. The play of light and the caprice of sunshine are rendered with much subtlety. Albert Edelfeldt is the most versatile artist of the group; Axel Gallen, at first naturalistic, developed into a decorative artist of fine style; Eero Jaernefelt charms with his airy studies and brilliant landscapes. Magnus Enckell, Pekka Halonen, and Victor Vesterholm sustain the school with work remarkable for sober and tasteful feeling. (R. MR.)

BALKAN STATES.

Until quite recent times the Balkan States had no part at all in the history of art. But at the Paris Exhibition of 1900 it was noted with surprise that even in south-eastern Europe there was a certain pulsation of new life. And there were also signs that painting in the Balkans, which thitherto had appeared only as a reflex of Paris and Munich art, would ere long assume a definite national character. At this Exhibition Bulgaria seemed to be the most backward of all, its painters still representing the manners and customs of their country in the style of the illustrated papers. Market-places are seen, where women with golden chains, half-nude boys, and old Jews are moving about; or cemeteries, with orthodox clergy praying and women sobbing; military pageants, wine harvests, and horse fairs, old men performing the national dance, and topers jesting with brown-eyed girls. Such are the subjects that Anton Mittoff, Raymund Ulrich, and Jaroslav Vesin paint. More original is Mvkuicka. In his most important work he represented the late princess of Bulgaria sitting on a throne, solemn and stately, in the background mosaics rich in gold, tall slim lilies at her side. In his other pictures he painted Biblical landscapes, battlefields wrapped in sulphurous smoke, and old Rabbis—all with a certain uncouth barbaric power. The Bulgarian painters have not as yet arrived at the æsthetic phase. One of the best among them, who paints delicate pale green landscapes, is Charalampi Ilieff; and Nicholas Michailoff, who lives at Munich, has executed pictures, representing nymphs, that arrest attention by their delicate tone and their beautiful colouring.

Quite modern was the effect of the small Croatian-Slavonic Gallery in the Exhibition. Looking at the pictures there, the visitor might imagine himself on the banks of the Seine rather than in the East. The French saying, "*Faire des Whistler, faire des Dagnan, faire des Carrière*," is eminently applicable to their work. Vlaho

Bukovak, Nicola Masic, Csiks, and Medovic all paint very modern pictures, and in excellent taste, only it is surprising to find upon them Croatian and not Parisian signatures.

Precisely the same judgment must be passed with regard to Rumania. Most of the painters live in Paris or Munich, have sought their inspiration at the feet of the advanced masters there, and paint, as pupils of these masters, pictures just as good in taste, just as cosmopolitan and equally devoid of character. Irène Deschly, a pupil of Carrière, illustrates the songs of François Coppée; Verona Gargouromin is devoted to the pale symbolism of Dagnan-Bouveret. Nicolas Grant paints bright landscapes, with apple trees with their pink blossoms, like Darnoye. Nicolas Gropeano appears as the double of Aman-Jean, with his female heads and pictures from fairy tales. Olga Koruca studied under Puvis de Chavannes, and painted Cleopatra quite in the tone of her master. A landscape by A. Segall was the only work that appeared to be really Rumanian, representing thatched huts.

Servia is in striking contrast to Rumania. No trace of modern influence has penetrated to her. There historical painting, such as was in vogue in France and Germany a generation ago, is the order of the day. Risto Voucanovitch paints his scenes from Servian history in brown; Paul Ivanovitch his in greyish *plein-air*. But in spite of this *paté* painting, the latter's works have no modern effect —as little as the sharply-drawn small landscapes of his brother Svatislav Ivanovitch. (R. MR.)

UNITED STATES.

The history of painting in the United States is almost entirely a 19th-century record. The earlier years of the nation were devoted to establishing government, subduing the land and the aborigines, building a commonwealth out of primeval nature; and naturally enough the æsthetic things of life received not too much consideration. In Colonial times the graphic arts existed, to be sure, but in a feeble way. Painting was made up of portraits of prominent people; only an occasional artist was disposed towards historical pictures; but the total result added little to the sum of art or to the tale of history. The first artist of importance was J. S. Copley (1737–1815), with whom painting in America really began. Benjamin West (1738–1820) belongs in the same period, though he spent most of his life in England, and finally became President of the Royal Academy. As a painter he is not to be ranked so high as Copley. In the early part of the 19th century two men, John Trumbull (1756–1843), a historical painter of importance, and Gilbert Stuart (1755–1828), a pre-eminent portrait painter, were the leaders; and after them came John Vanderlyn (1776–1852), Washington Allston (1779–1843), Rembrandt Peale (1787–1860), J. W. Jarvis (1780–1834), Thomas Sully (born in England, 1783–1872)—men of importance in their day. The style of all this early art was modelled upon that of the British school, and indeed most of the men had studied in England under the mastership of West, Lawrence, and others. The middle or second period of painting in the United States began with the landscape work of Thomas Doughty (1793–1856) and Thomas Cole (1801–1848). It was not a refined or cultivated work, for the men were in great measure self-taught, but at least it was original and distinctly American. In subject and in spirit it was perhaps too panoramic and pompous; but in the hands of A. B. Durand (1796–1886), J. F. Kensett (1818–1872), and F. E. Church (1826–1900), it was modified in scale and improved in technique.

A group of painters called the Hudson River school finally emerged. To this school some of the strongest landscape painters in the United States owe their inspiration, though in almost every case there has been the modifying influence of foreign study. Contemporary with Cole came the portrait painters Chester Harding (1792–1866), C. L. Elliott (1812–1868), Henry Inman (1801–1846), William Page (1811–1885), G. P. A. Healy (1813–1894), Daniel Huntington, and W. S. Mount (1807–1868), one of the earliest genre painters. Foreign art had been followed to good advantage by most of these painters, and as a result some excellent portraits were produced. The excellence of the work was not, however, appreciated by the public generally, because art knowledge was not at that time a public possession. Little was required of the portrait painter beyond a recognizable likeness. A little later the teachings of the Düsseldorf school began to have an influence upon American art through Leutze (1816–1868), who was a German pupil of Lessing, and went to America to paint historical scenes from the Revolutionary War. But the foreign influence of the time to make the most impression came from France in 1855 with two American pupils of Couture—W. M. Hunt (1824–1879) and Thomas Hicks (1823–1890). Hunt had also been a pupil of Millet at Barbizon, and was the real introducer of the Barbizon painters to the American people. After his return to Boston his teaching and example had much weight in moulding artistic opinion. He, more than any other, turned the rising generation of painters towards the Paris schools. Contemporary with Hunt and following him were a number of painters, some self-taught and some schooled in Europe, who brought American art to a high standard of excellence. George Fuller (1822–84), Eastman Johnson, Elihu Vedder, produced work of much merit; and John La Farge and Winslow Homer were unquestionably in 1902 the foremost painters in the United States. In landscape the three strongest men have passed away — A. H. Wyant, George Inness, and Homer Martin. Swain Gifford, Edward Gay, Thomas Moran, Jervis McEntee, Albert Bierstadt, are other landscape painters of note who belonged to the middle period and reflected the traditions of the Hudson River school to some extent. With the Centennial Exhibition at Philadelphia in 1876 a widespread and momentous movement in American art began to shape itself. The display of pictures at Philadelphia, the national prosperity, and the sudden development of the wealth of the United States had doubtless much to do with it. Many young men from all parts of the country took up the study of art and began going abroad for instruction in the schools at Munich, and, later, at Paris. Before 1880 some of them had returned to the United States and founded schools and societies of art, like the Art Students' League and the Society of American Artists. The movement spread to the Western cities, and in a few years museums and art schools began to appear in all the prominent towns, and a national interest in art was awakened. After 1870 the predominant influence, as regards technical training, was French. Many students still go to Paris to complete their studies, though there is a large body of accomplished painters teaching in the home schools, with satisfactory results as regards the work of their pupils. From their French training, many of the American artists have been charged with echoing Parisian art; and the charge is partly true. They have accepted French methods because they think them the best, but their subjects and motives are sufficiently original.

Among the "younger element" in American art are W. M. Chase, for many years President of the Society of American Artists, Walter Shirlaw, T. W. Dewing, Kenyon Cox, Abbott Thayer, Robert Blum, J. C. Beckwith, G. W. Maynard, E. E. Simmons, W. H. Low, Robert Reid, Wilton Lockwood, C. Y. Turner, H. S. Mowbray, J. W. Alexander, Irving Wiles, E. R. Blashfield, J. McClure Hamilton—

painters who have done very good work in portraiture, in easel pictures, and in wall paintings. The most completely indigenous art yet produced in America has been in the field of landscape painting. In spite of the example of the famous Fontainebleau painters, the Americans have chosen the material of their own country and pictured it with fine atmospheric and colour effects, and no little sentiment. Men like D. W. Tryon, C. A. Platt, Alden Weir, J. H. Twachtman, Theodore Robinson, Childe Hassam, Horatio Walker, have received some inspiration from such French painters as Daubigny, Bastien-Lepage, and Monet, but no more than every painter receives from his master. Besides the painters who reside in the United States, there is a large contingent of Americans resident abroad which perhaps belongs to the American school as much as to any other. These painters do not, however, represent the land or the people to the extent usually assumed by Europeans. Indeed, it is questionable if they represent America in any way. James McNeill Whistler, though American-born, is an example of the modern man without a country. No nation can claim him as an artist, because he seems to have no nationality. E. A. Abbey, John S. Sargent, Mark Fisher, and J. J. Shannon are American only by birth. They are resident in London and are cosmopolitan in their methods and themes. This may be said with equal truth of many painters resident in Paris and elsewhere on the Continent. However good as art it may be, there is nothing distinctively American about the work of W. T. Dannat, Alexander Harrison, George Hitchcock, Gari Melchers, C. S. Pearce, E. L. Weeks, J. L. Stewart, and Walter Gay. If they owe allegiance to any centre or city, it is to Paris rather than to New York.

During the last quarter of the 19th century much effort and money were devoted to the establishment of institutions like the Metropolitan Museum in New York, the Carnegie Museum at Pittsburg, and the Art Institute in Chicago. Every city of importance in the United States has its gallery of paintings. Schools of technical training and societies of artists likewise exist wherever there are important galleries. Exhibitions during the winter season and at great national expositions, like the World's Fair at Chicago and the Pan-American Exhibition at Buffalo, give abundant opportunity for rising talent to display itself; and, in addition, there is a growing public patronage of painting, as shown by the extensive mural decorations in the Congressional Library building at Washington, in the Boston Public Library, in many colleges and churches, in courts of justice, in the reception-rooms of large hotels, in theatres and elsewhere. All these educational influences are being felt by the people, and there is an increasing appreciation of painting that augurs well for the future. (J. C. VAN D.)

Schorlau, or TCHORLAU, chief town of a sanjak in the vilayet of Rodosto, European Turkey, situated on an eminence on the right bank of a small tributary of the Erghĕnĕ, and about 2 miles from the station on the Constantinople-Adrianople Railway, 20 miles north-east of Rodosto. It possesses three mosques and several Christian churches. It has manufactures of woollen cloth (*chayak*) and native carpets, and exports cereals, oil-cloth, carpets, cattle, poultry, fresh meat, game, fruits, wine, alcohol, hides, and bones. Population, 11,500, of whom about one-half are Greeks, one-third Turks, and the remainder Armenians and Jews.

Schouvaloff. See SHUVALOV.

Schulze-Delitzsch, Franz Hermann (1808–1883), German economist, was born at Delitzsch, 29th August 1808. The place-name Delitzsch was added in 1848 to distinguish him from other Schulzes in the National Assembly. At the age of thirteen he was sent to the Nikolaischule at Leipzig; he proceeded to that university in 1827, and to Halle in 1829. Devoting himself to the study of law, he became at thirty years of age an assessor in the court of justice at Berlin, and three years later was appointed *patrimonialrichter* at Delitzsch. Entering the Parliament of 1848, he joined the Left Centre, and, acting as president of the Commission of Inquiry into the Condition of the Labourers and Artisans, became impressed with the necessity of co-operation to enable the smaller tradespeople to hold their own against the capitalists. He was a member of the Second Chamber in 1848–49; but as matters ceased to run smoothly between himself and the high legal officials, he threw up his public appointments in October 1851, and withdrew to Delitzsch. Here he devoted all his efforts to the organization and development of co-operation in Germany, and to the foundation of Vorschuss-vereine (people's banks), of which he had established the first at Delitzsch in 1850. These developed so rapidly that Schulze-Delitzsch in 1858, in *Die Arbeitenden Klassen und das Assoziationswesen in Deutschland*, enumerated twenty-five as already in existence. In 1859 he promoted the first *Genossenschaftstag*, or co-operative meeting, in Weimar, and founded a central bureau of co-operative societies. In 1861 he again entered the Prussian Chamber, and became a prominent member of the Progressist party. In 1863 he devoted the chief portion of a testimonial, amounting to 150,000 marks, to the maintenance of his co-operative institutions and offices. This, however, was only to meet an exceptional outlay, for he always insisted that they must be self-supporting, and refused repeated offers of pecuniary aid. The next three or four years were given to the formation of local centres, and the establishment of the Deutsche Genossenschafts-Bank, 1865.

The spread of these organizations naturally led to legislation on the subject, and this too was chiefly the work of Schulze-Delitzsch. As a member of the Chamber in 1867 he was mainly instrumental in passing the Prussian law of association, which was extended to the North German Confederation in 1868, and later to the Empire. Schulze-Delitzsch also contributed to uniformity of legislation throughout the states of Germany, in 1869, by the publication of *Die Gesetzgebung über die privatrechtliche Stellung des Erwerbs- und Wirthschaftsgenossenschaften, &c.* His life-work was now complete; and following the central idea of the *monts de piété*, he had placed the advantages of capital and co-operation within the reach of struggling tradesmen throughout Germany. His remaining years were spent in consolidating this work. Both as a writer and a member of the Reichstag, his industry was incessant, and he died in harness on the 29th April 1883 at Potsdam, leaving the reputation of a benefactor to the smaller tradesmen and artisans, in which light he must be regarded rather than as the founder of true co-operative principles in Germany. (G. F. B.)

Schumann, Clara Josephine (1819–1896), German pianist, daughter of the distinguished pianoforte teacher Friedrich Wieck, was born at Leipzig, 13th September 1819. She was taught the piano by her father from her fifth year, and first appeared in public in 1828, obtaining the honour of an appearance at the famous Gewandhaus Concerts as early as 1832, when she played a concerto by Moscheles. Before this she had made a tour to Weimar, Cassel, Frankfort, and Paris, making a great success wherever she was heard. Her powers as a composer were already dawning, and a theme and variations of her own appeared in some of her earliest programmes. A performance of Bach's triple concerto with Mendelssohn and Rakemann in November 1832 marked her definite entry into the world of the highest music, and thenceforward she devoted herself to the interpretation of

the classical composers. In 1836 she visited Vienna, and it was about this time that she aroused the admiration of Robert Schumann, to whom, after many delays and troubles of all kinds, arising from the opposition of her parents to the match, she was married on 12th September 1840. From this time forth she undertook the difficult task of compelling the public to understand Schumann's music, and she succeeded in winning for it the admiration of all cultivated musicians in the various countries where she played. Her first visit to England took place in 1856, two years after her husband's insanity had declared itself in an attempt at suicide. The leading critics of the day set themselves in violent opposition to Schumann's music, and although they accepted her as a great pianist, her reception was so far from enthusiastic that she did not pay London a second visit until 1865; but after that time her visits were annual until 1882, with the exception of some four seasons. From 1885 to 1888 she regularly appeared each year in London, arousing more and more enthusiasm. In 1878 she was appointed teacher of the piano at the Hoch Conservatorium at Frankfort, and held the post until 1892, when she was compelled to retire owing to a distressing affection of the auditory nerve, but from this she recovered almost completely, and her death on 20th May 1896 was almost unexpected. Her most prominent qualities as a pianist were the wonderful sympathy with which she interpreted nearly all schools of music, her mastery of tone-gradation, and her entire concealment of all manual effort. As a composer her work is worthy to be remembered, quite apart from her playing. Her compositions are mainly for the piano, and have individuality and charm, while her few songs are exquisitely expressive. She edited her husband's works for Breitkopf and Haertel, and wrote cadenzas to two of Beethoven's concertos, in addition to her original compositions. (J. A. F. M.)

Schurz, Carl (1829-——), American statesman and reformer, was born in Liblar, near Cologne, Germany, on 2nd March 1829. At the age of twenty he left the university of Bonn to join the revolutionary movement in South Germany, and in consequence was obliged to flee the country. After a short stay in England he went to the United States in 1852. Engaging in the practice of law and journalism in Wisconsin, he soon attained prominence as a Republican politician. In 1861 he was appointed minister to Spain, but soon resigned to join the Union army, in which he rose to the rank of major-general of volunteers. After the war he resumed editorial work at St Louis, and became United States senator from Missouri 1869–75. In 1872 he was conspicuous in the Liberal Republican (anti-Grant) movement, presiding at the National Convention. During the Hayes administration he was secretary of the interior (1877–81), and at its close removed to New York City, where he ever afterwards resided. As editorial writer on the New York *Evening Post* (1881–84) and *Harper's Weekly* (1892–98), and in other literary enterprises, he vigorously promoted the ideas through which Mr Cleveland was twice elected to the Presidency. With the cause of administrative reform he was peculiarly identified, serving continuously as president of the Civil Service Reform Association since 1893. Mr Schurz's books on *Henry Clay* and *Abraham Lincoln* are of considerable merit.

Schwabach, a town of Bavaria, district of Middle Franconia, Germany, 9 miles by rail south of Nuremberg. It possesses an interesting parish church (1469–95), with an altar-piece (1506) by Veit Stoss, and paintings and carved work by Wohlgemut, Martin Schön, and others, and a lofty pyx by Adam Krafft; also a fountain (1716), a Jewish theological school, and a teachers' seminary. It is a chief seat of the needle manufacture in Bavaria. Gold and silver wire work, haberdashery, and brewing are the principal industries. The Schwabacher Articles of 1529, drawn up by Luther, formed the foundation of the Augsburg Confession. Population (1900), 9385.

Schwarzburg-Rudolstadt, a principality of Germany, one of the Thuringian states, with an area of 363 square miles, and a population (1885), 83,836; (1900), 92,657; giving a density of 255 inhabitants to the square mile. In 1900, 45,082 of the inhabitants were males and 47,575 females; and nearly the whole were Evangelical Lutherans. Agriculture supports 27,195 persons, or 30·6 per cent. of the population. The number of farms in 1895 was 13,264, of which 12,258 were each less than 25 acres in extent, 986 were between 25 and 250 acres each, and 20 exceeded 250 acres. In 1900 the number of pigs was 31,877; of sheep, 23,562; of cattle, 22,152; and of horses, 3505. For the period 1900–02 the annual state revenue and expenditure were estimated to balance at £104,840; nearly one-half of the revenue is derived from domains and state property. There is a public debt of £201,530 (1900), and in 1901 the state contribution to the imperial exchequer was fixed at £46,920.

Schwarzburg-Sondershausen, a principality of Germany, one of the Thuringian states, with an area of 333 square miles, and population (1885), 73,606; (1900), 80,678; giving a density of 242 inhabitants to the square mile. In 1900, 39,401 of the inhabitants were males and 41,277 females. The people belong almost entirely to the Evangelical Lutheran Church. In 1895 agriculture supported 25,064 persons, or 32 per cent. of the population. The number of farms was 11,787, of which 10,622, or 90·1 per cent., were each less than 25 acres in extent, 1128 were between 25 and 250 acres, and 37 exceeded 250 acres. In 1900 the live stock consisted of 37,888 sheep, 40,863 pigs, 25,036 cattle, and 4948 horses. In 1900–02 the state revenue and expenditure were each estimated at £167,000 annually. The public debt amounted in 1899 to £162,400, and the state contribution in 1901 to the imperial exchequer to £40,825.

Schwaz, a market-place in Tirol, Austria, on the river Inn, 18½ miles north-east of Innsbruck, on the Austrian State Railway. It is dominated by the old château of Freundsburg, and on an adjoining hill is a Benedictine abbey, which was restored after a fire in 1868. There are some old silver, copper, and iron mines in the vicinity, and tobacco, stoneware, hosiery, woollen yarn, and wire are manufactured. Population (1890), 5888; (1900), 6545.

Schwechat, a market-place in Lower Austria, about 5 miles south-east of Vienna. It has the largest brewery of the monarchy (with an annual production of about 600,000 hectolitres), together with important smelting and iron works, cotton-spinning, factories of electrical plant, &c. The meeting at Schwechat of the Emperor Leopold I. with Sobieski in 1683 is commemorated by an obelisk. The imperial troops defeated the Hungarian insurgents in a battle fought here in October 1848. Population (1890), 6031; (1900), 8241.

Schweidnitz, a town of Prussia, province of Silesia, 35 miles by rail south-east of Liegnitz. It is the seat of a provincial industrial school, and manufactures woollens and linens, stoves, hosiery, carpets, and millstones in addition to the industries already named in the 9th edition. Population (1885), 23,669; (1900), 28,432.

Schweinfurt, a town of Bavaria, district of Lower Franconia, Germany, on the left bank of the Main, 27 miles by rail north-north-east of Würzburg. A new classical school was built in 1881 to replace the one founded by Gustavus Adolphus of Sweden in 1631. There are

monuments to Rückert (1890) and in commemoration of the war of 1870–71, a commercial institute, and a technical school. The industries remain as stated in the 9th edition, except that factories for steel shot and bicycle bearings have been added. Population (1885), 12,502; (1900), 15,295.

Schweinfurth, Georg August (1836– ——), explorer, was born at Riga, 29th December 1836, and educated at the universities of Heidelberg, Munich, and Berlin (1856–62), where he particularly devoted himself to botany and palæontology. Commissioned to arrange the collections brought from the Sudan by von Barnim and Hartmann, his attention was directed to that region; and he proceeded thither himself in 1863, when he travelled round the shores of the Red Sea, passed on to Khartum, and returned to Europe in 1866. His researches attracted so much attention that in 1868 the Humboldt-Stiftung of Berlin entrusted him with an important scientific mission to the interior of East Africa. Starting from Khartum in January 1869, he went up the White Nile to Bahr-el-Ghazal and Dyoor, and then, with a party of ivory dealers, through Dinka, Bongo, and Niam-Niam; but unfortunately nearly all his collections, sketches, and other belongings were lost in a fire in the camp. He returned in 1871 and published an account of the expedition, under the title of *Im Herzen von Afrika*, Leipzig, 1874, which also contains interesting notices of the pygmies of Akka. In 1873–74 he accompanied Rohlfs in his attempt to penetrate into the desert of Libya. Settling at Cairo in 1875, he founded a geographical society, under the auspices of the Khedive, and devoted himself exclusively to African studies, historical and ethnographical. In the following year he penetrated into the desert of Arabia with Güssfeldt, and continued the exploration at intervals until 1888, and during the same period made geological and botanical investigations in the neighbourhood of Cairo, in the valley of the Nile, &c. Since 1889 he has resided in Berlin; but he visited the Italian colony of Erithrea in 1891, 1892, and 1894. The accounts of all his travels and researches have appeared either in book form or in periodicals, such as *Petermanns Mitteilungen*, the *Zeitschrift für Erdkunde*, &c.

Schwerin, a town of Germany, capital of grand-duchy of Mecklenburg-Schwerin, 129 miles by rail north-west of Berlin and 20 miles south of the Baltic. The town has a fine equestrian statue of the grand-duke Frederick Francis II. (1893), a post office, a ducal library of about 180,000 volumes, a veterinary school, lunatic asylum, military and technical schools, and a "school of pages." Population (1885), 31,528; (1900), 38,667.

Schwerin, a town of Prussia, province of Posen, at the confluence of the Obra and the Warthe, 28 miles by rail east of Küstrin. There are tobacco and other factories. Population (1900), 7316.

Schwerte, a town of Prussia, province of Westphalia, 9 miles by rail north-east of Hagen. There are iron and nickel works, and it has a Romanesque church, with carved altar of 1523 and 14th and 15th century stained-glass. Population (1895), 9892; (1900), 12,261.

Schwetz, a town of Prussia, province of West Prussia, 29 miles by rail north-east of Bromberg, on the left bank of the Vistula. There are remains of a castle (1335–41) of the Teutonic Order, three churches, a provincial lunatic asylum, and some tanning and damask weaving. There is also a trade in wool and corn. Population (1900), 7010.

Schwetzingen, a town of Germany, grand-duchy of Baden, 9 miles by rail south-east of Mannheim. It has a grand-ducal castle (1656, destroyed by the French in 1689, subsequently rebuilt) and gardens laid out in the middle of the 18th century in imitation of those of Versailles. There is a technical school. Cigars, yeast, &c., are manufactured, and there is a trade in hops and tobacco. Population (1900), 6417.

Schwiebus, a town of Prussia, province of Brandenburg, 47 miles east of Frankfort-on-the-Oder by rail. It is still in part surrounded by its mediæval wall, and has an ancient market-place, a couple of churches, a castle, and an orphanage. Cloth, machinery, and stearine candles are manufactured, and there are flour-mills, breweries, distilleries, and lignite mines. Population (1900), 8659.

Schwyz, one of the Swiss cantons. Its total area is 350·6 square miles. Of this, 254·8 square miles are reckoned as "productive," forests, covering 62·4 square miles, and vineyards 1·1 square mile. The population in 1880 was 51,109, and in 1900, 55,385, or 158 inhabitants to each square mile. The population is almost wholly Roman Catholic, and also mostly German-speaking, the numbers of Italian-speaking and French-speaking inhabitants being quite inconsiderable. The capital is Schwyz, which in 1888 had 6616 inhabitants (in 1900, 7398); its port on the Lake of Lucerne is Brunnen. The largest town in the canton is Einsiedeln, which in 1900 had 8496 inhabitants. There are 6 administrative districts in the canton, comprising 30 "communes." In 1897 the state revenue was 534,467 francs (a rise of 47½ per cent. since 1885), and the state expenditure 510,210 francs (a rise of 46 per cent. since 1885). The cantonal financial management is very defective. In 1897 the public debt was 2,960,000 francs. In 1899 there were 417 mountain pastures, or "alps," in the canton, supporting 17,492 cows. There is a railway from Arth-Goldau to the Lake of Zürich, with a branch from Biberbrücke up to Einsiedeln. The cantonal constitution of 1876 was further revised in 1898. The legislature is elected for 4 years by the "Gemeinden" in the proportion of one member for each 600 (or fraction over 300) inhabitants. The 7 members of the executive are chosen for 4 years by popular vote in the whole canton. In case of elections to the legislature, it is provided that in each "Gemeinde" that is entitled to elect 3 or more members, the election shall take place according to the principles of proportional representation, the same system as in Zug. The "obligatory referendum" obtains in the case of all laws, and the "facultative referendum" at the demand of 2000 citizens as regards resolutions and decrees of the legislature. It must also be noted that 2000 citizens have the right of "initiative" as to the revision of the cantonal constitution, or as to legislative projects.

(W. A. B. C.)

Sciacca, a seaport town and bishop's see of Italy, Sicily, province of Girgenti, 30 miles west-north-west of Girgenti. It is the Sicilian headquarters of Mediterranean coral fishing. Down to 1888 such large quantities of coral were taken that in the year named fishing was suspended by Government order. It was resumed in 1893, during which and the year following 193 and 183 boats, manned by 2172 and 2205 men respectively, were engaged; and they brought up 613 and 633 tons of coral, valued at £78,325 and £88,390 respectively. Of these Sciacca sent 73 and 72 boats. The town has manufactures of bricks and pottery, barrels, baskets, and olive oil, and cures fish. In 1897 its port was cleared by 489 vessels of 74,690 tons. Population (1881), 20,709; (1899), 23,000.

Scilla, a seaport town of Italy, Calabria, province of Reggio, 14 miles by rail north by east of Reggio. It stands on a steep cliff overlooking the Strait of Messina, and has a citadel which withstood the French in 1806–08. It was

in great part rebuilt after the earthquake of 1783, and is famous for its silk and wine, and carries on fishing for tunny and sword-fish. It is the ancient *Scylla*. Population, about 7000.

Scillitan Martyrs.—The recovery in their original form of the Acts of the Scillitan Martyrs has given us the earliest documents of the Church of Africa and, it would seem, the earliest specimen of Christian Latin. The martyrs take their name from Scilla (or Scillium), a town in Numidia. Their trial and execution took place in Carthage under the Pro-consul Vigellius Saturninus, whom Tertullian declares to have been the first persecutor of the Christians in Africa. The date of their martyrdom is 17th July 180 A.D. It is thus the concluding scene of the persecution under Marcus Aurelius, which is best known from the sufferings of the churches of Vienna and Lyons. The great emperor died on 17th March of the year in question, and persecution ceased almost immediately upon the accession of Commodus. A group of sufferers called the Madaurian martyrs seems to belong to the same period: for in the correspondence of St Augustine, Namphamo, one of their number, is spoken of as "archimartyr," which appears to mean protomartyr of Africa. We have in this martyrdom an excellent example of "Acts of Martyrs" properly so called. The document is in brief legal form, beginning with the date and the names of the accused, and giving the actual dialogue between them and their judge. It closes with the sentence, based on "obstinate" persistency in an illicit cult, and with the proclamation by the herald of the names of the offenders and the penalty. All this may quite well be a transcript of the *acta*, or official report of the proceedings. A Christian appends the words: "And so they all together were crowned with martyrdom; and they reign with the Father and the Son and the Holy Ghost, for ever and ever. Amen."

The Scillitan sufferers were twelve in all—seven men and five women. Two of these bear Punic names (Nartzalus, Cintinus), but the rest Latin names. Six had already been tried: of the remainder, to whom these *acta* primarily relate, Speratus is the principal spokesman. He claims for himself and his companions that they have lived a quiet and moral life, paying their dues and doing no wrong to their neighbours. But when called upon to swear by the genius of the emperor, he replies: "I recognize not the empire of this world; but rather do I serve that God whom no man hath seen, nor with these eyes can see." Here he uses the language of 1 Tim. vi. 16; and it is interesting also to note that in reply to the question, "What are the things in your chest?" he says, "Books and letters of Paul, a just man." The martyrs are offered a delay of thirty days to reconsider their decision, but this they all alike refuse. These Acts have been long known in an expanded form, or rather in a variety of later recensions. The fame of the martyrs led to the building of a basilica in their honour at Carthage; and their annual commemoration required that the brevity and obscurity of their Acts should be supplemented and explained, to make them suitable for public recitation.

The historical questions connected with these martyrs are treated by Lightfoot, *Ignatius* (1889, ed. 2), i. 524 ff. The Latin text, together with later recensions and a Greek version, is published in *Texts and Studies*, i. 2 (Passion of Perpetua, 1890). The original Latin was published independently about the same time in the *Analecta Bollandiana*, viii. p. 5. (J. A. R.)

Scilly Islands, a group belonging to the county of Cornwall, England, 40 miles due west of Lizard Point, and reached by a service of steamers from Penzance. The government of the islands is vested in a county council, distinct from that of Cornwall, formed in 1892, consisting of a president, vice-president, 4 aldermen, and 18 councillors. Telephone and telegraph communication connects with the mainland. The early potato industry has given place largely to the raising of early asparagus and other vegetables, and spring flowers. This trade has increased so considerably that from 200 tons in 1889 it had risen to 515 tons in 1896. There is a coasting trade of about 20,000 tons clearances annually. The area of the principal islands is as follows:—St Mary's, 1613 acres; Tresco, 917 acres; St Martin's, 650 acres; St Agnes, 444 acres; and Bryher, about 350 acres. The population of the whole islands (area, 3980 acres) was in 1881, 2320; in 1891, 1911; in 1901, 1974. The population of St Mary's Island was in 1891, 1201; in 1901, 1275. Hugh Town, the capital of the islands, is on St Mary's. Its pier was extended in 1889 at a cost of £4000, and new public buildings were erected in the same year. In 1882 a new church to St Nicholas was erected on Tresco.

Scio, the classical *Chios*, an island on the west coast of Asia Minor, forming, with the islands of Ipsara, Nicaria, Leros, Calymnos, and Cos, a sanjak of the Archipelago vilayet. In 1881 Scio was visited by a very severe earthquake. Over 5600 persons lost their lives, the villages in the Kampos were destroyed, the monastery built by Constantine Monomachus was overthrown, and more than half the villages were seriously damaged. The island has now recovered its prosperity. A harbour has been made at Castro, and steam flour-mills, foundries, and tanneries have been established. Rich antimony and calamine mines are worked by a French undertaking, and good marble is quarried by an Italian company. In 1899 the exports—gum mastic, fruit, and leather—amounted to £247,400, and the imports to £265,000. The population of the island is 64,000 (Moslem 1000, Greeks 62,750, Jews 250), and of the town 16,000.

Scotland.—The population at the census of 1891 was 4,025,647 (1,942,717 males and 2,082,930 females), and at the census of 1901, 4,472,000 (2,173,151 males and 2,298,849 females). The net increase between 1881 and 1891 was 290,074 (143,242 males and 146,832 females), or at a rate of 7·8 per cent., and between 1891 and 1901, 446,353, or at the rate of 11·09 per cent. The areas (old and amended) and populations of the counties are given under the several headings which deal with them:—

Population, vital and social statistics.

TABLE I.—*Showing Grouping of Population in 1871, 1881, and 1891.*

	Total Population.			Increase or Decrease.				Percentage to Total Population.		
	1871.	1881.	1891.	1871 to 1881.		1881 to 1891.		1871.	1881.	1891.

[1] The incomplete returns show that in 1901 the town population was 75 per cent. of the whole.

Calculated according to the corrected area of 1891, the population of 1881 gave about 121 persons to the square

TABLE II.—*Showing Population of Chief Towns, 1881, 1891, and 1901.*

	1881.	1891.	1901.
Glasgow . .	551,415	565,839 (of enlarged area, 658,198)	780,423
Edinburgh .	226,357	261,225 (of enlarged area)	316,479
Dundee . .	140,239	153,330	160,871
Aberdeen . .	105,189	121,623	143,722
Paisley . .	55,638	66,425	79,355
Leith . .	59,485	67,700	76,667
Govan . .	50,492	63,625	76,351
Greenock . .	66,704	63,423	67,645
Partick . .	27,410	36,538	54,274
Coatbridge .	24,812	30,034	36,981
Kilmarnock .	23,901	28,447	34,161
Perth . .	28,980	29,899	32,872
Hamilton . .	18,517	24,859	32,775
Motherwell .	12,904	18,736	30,423

mile, instead of 125, as stated in the 9th edition of this work. In 1891 the density worked out at 131 persons to the square mile, and in 1901 at 149. Dumbarton, with 25·44, showed the largest rise between 1881 and 1891, owing to the development of its shipbuilding, engineering, and dyeing industries; Linlithgow, with 24·4, the largest between 1891 and 1901. Decreasing counties were purely agricultural in character; but Selkirk, owing to contraction of the woollen industry, showed the greatest loss—15·8. Table II. shows the population of the principal towns in Scotland in 1881, 1891, and 1901.

Of the four large towns, Aberdeen, with 22·9 per cent., increased most rapidly between 1891 and 1901; Dundee, with 4·5 per cent., most slowly. The iron town of Motherwell, with 62·5, shows the most phenomenal growth. Table III. shows the increase of population that should have taken place between 1871 and 1881 and between 1881 and 1891, compared with the actual increase, the grouping being into towns of over 25,000, towns with less than 25,000 and more than 10,000, towns between 10,000 and 2000, and rural districts. Comparison with Table IV. will show to what an extent the actual increase in large towns was due to immigration of Irish and English, in addition to immigration from Scottish rural districts:—

TABLE III.—*Showing Increase or Decrease of Population in 1871, 1881, and 1891.*

Groups.	Population according to Grouping in 1871.		Population according to Grouping in 1881.		Births.	Deaths.	Births.	Deaths.	Increase or Decrease, 1871–81.		Increase or Decrease, 1881–91.	
	1871.	1881.	1881.	1891.	1871–80.	1871–80.	1881–90.	1881–90.	Actual.	Excess of Births over Deaths.	Actual.	Excess of Births over Deaths.
Principal towns . . .	1,193,940	1,411,536	1,409,260	1,590,310	429,679	296,285	517,454	330,010	+217,596	+133,394	+181,050	+187,444
Large towns . . .	327,734	388,797	404,302	467,642	150,005	94,408	146,367	83,966	+61,063	+55,597	+63,570	+62,401
Small towns . . .	696,958	790,796	784,654	840,339	293,220	171,485	266,277	149,843	+93,838	+121,735	+55,685	+116,434
Rural districts . . .	1,141,386	1,144,444	1,137,357	1,127,356	361,367	203,200	321,832	179,763	+3,058	+158,157	−10,231	+142,069
	3,360,018	3,735,573	3,735,573	4,025,647	1,234,351	765,468	1,251,930	743,582	+375,555	+408,883	+290 074	+508,848

The novel facts to be noted in connexion with the distribution of the population in 1891 are:—The rural population, having previously all but ceased to rise, had actually begun to fall. The actual increase and the excess of births over deaths almost balanced one another in the large towns. In the principal towns the tide of immigration would seem to have turned by 1891, the actual increase of the population being 6394 less than the natural increase; whereas in 1881, owing to immigration, the actual increase over 1871 was 84,202 more than the natural increase. Table IV. shows the nationalities of the people of Scotland in 1881 and 1891, with the nationalities in burghs with a population of 10,000 and upwards:—

TABLE IV.—*Illustrating Nationalities in 1881 and 1891.*

Nationalities.	Scotland, 1881.		Scotland, 1891.		Burghs, 1891.	
	Number.	Percentage of Pop.	Number.	Percentage of Pop.	Number.	Percentage of Pop.

Welsh .	1,806	0·05	2,309	0·06	1,362	0·07
Channel Islanders	949	0·02	927	0·02	567	0·03
	3,735,573	100	4,025,647	100	1,995,511	100

In contradistinction to that of 1881, the census of 1891 showed both an actual and a proportional decrease of non-natives in the population of Scotland. There were 337,814 in 1881 and 336,947 in 1891, the proportions to population being 9·043 and 8·370 respectively, the decline of Irish immigration being the cause of the falling off. Non-natives, however, continued to increase between 1881 and 1891, the percentage of increase being 1·584.

The number of persons of Scottish birth in England in 1891 was 282,271 and in Ireland 27,323—total 309,594. On the other hand, the natives of these two countries in Scotland in 1891 numbered together 303,543. Table V. shows how the population was affected by emigration and immigration in four decades:—

TABLE V.—*Illustrating Emigration and Immigration.*

	1861–70.	1871–80.	1881–90.	1891–1901.
Excess of births over deaths . . .	414,594	468,363	508,348	498,135
Actual increase . .	297,385	375,555	290,074	446,310
Balance	117,209	92,808	218,274	51,825

The male population in 1891 was 1,942,717, an increase over 1881 of 7·9 per cent., the female population 2,082,930, an increase of 7·7 per cent. In 1901 the males numbered 2,173,151 and the females 2,298,849, showing increases of 11·8 and 10·4 per cent. respectively. The proportion of 105·8 females to 100 males was the lowest ratio experienced since 1801. The highest was 118·5 in 1811, and since then the decline has been almost regular from census to census. In Scotland the ratio in 1891 was greater than in England, where it was 106·8 to 100; or in Ireland, where it was 102·8 to 100. The percentage of illegitimate births, after falling almost continuously during the century, rose from 7·04 in 1871–80 to 8·16 in 1881–90, but fell again to 7·11 in 1891–1900, 6·73 in the large towns, 7·88 in the small town districts, 10·33 in the mainland rural, and 6·02 in the insular-rural districts. Wigtown and Ross and Cromarty exhibited the two extremes, the former—a lowland rural district—having an illegitimacy percentage of 16·51, and the former—a highland rural district—having only 4·92 per cent. Table VI. shows the percentages to population of births, deaths, and marriages registered in the four decades specified:—

TABLE VI.—*Showing Birth, Death, and Marriage Ratio.*

	1861–71.	1871–81.	1881–91.	1891–1901.
Birth-rate	3·48	3·47	3·22	3·01
Death-rate	2·19	2·15	1·91	1·84
Marriage-rate . . .	0·69	0·71	0·66	0·70

The marriage-rate in decade 1881–91 was higher than that for Scotland in six counties—Forfar, Renfrew, Ayr, Lanark, Linlithgow, and Edinburgh—and below in all the others. Renfrew had the highest rate—73·11 per ten thousand—and Sutherland the lowest—31·91. Five counties had a higher death-rate than Scotland—Forfar, Edinburgh, Bute, Renfrew, Lanark; of the others, which were below the mean, Peebles was lowest with 14·028. The mortality rate at ages under five years to the population alive at the same age varies from 1·7 in Orkney to 6·8 in Lanark. Table VII. gives the percentage of single, married, and widowed to the total of each sex in Scotland, England and Wales, and Ireland respectively in 1891:—

TABLE VII.—*Showing Percentage of Single, Married, and Widowed in the United Kingdom (1891).*

Sexes.	Scotland.			England and Wales.			Ireland.		
	Sing.	Mar.	Wid.	Sing.	Mar.	Wid.	Sing.	Mar.	Wid.
Males	66·3	30·3	3·2	62·0	34·5	3·5	69·5	24·4	3·9
Females	63·1	28·9	7·8	59·6	32·9	7·5	64·0	26·2	9·7

Blind, &c.—The number of blind persons in Scotland in 1891 was 2797 (1417 males and 1380 females), the proportion to the total population being 1 to 1439, as against 1 to 1182 in 1881. The deaf and dumb numbered 2125 (1195 males and 930 females), the proportion to the population being 1 to 1894, compared with 1 to 1744 in 1881. The number of lunatics was 10,455 (4918 males and 5527 females), equal to 1 to 385 of the population; in 1881 the number was 8406, or 1 in 444. In addition, there were 5017 imbeciles (2506 males and 2511 females), being 1 to 802 of the population, compared with 5991, or 1 in 623, in 1881.

Occupations.—Table VIII. exhibits the classification of the people in 1881 and 1891. The proportions of the professional, commercial, and industrial classes maintained the increase which they had shown in the preceding decade; and while the agricultural class continued to diminish, there was no cessation of the diminution of the unproductive class, whose falling away in 1881 was put down to a change in classification since the previous census:—

TABLE VIII.—*Classifying Population in Professions and Trades.*

Classes of Occupation.	1881.	1891.	Per cent. of Total Population.	
			1881.	1891.
Professional	96,103	111,319	2·57	2·76
Domestic	176,565	203,153	4·73	5·05
Commercial	132,126	180,952	3·54	4·49
Agricultural and fishing	269,537	249,124	7·21	6·19
Industrial	932,653	1,032,404	24·97	25·65
Unproductive	2,128,589	2,248,695	56·98	55·86

Pauperism.—In Scotland pauperism showed an almost continuous decline from 1868 to 1891, the ratio of ordinary poor per thousand of estimated population being 40 in the former year and 20 in the latter. The average in the decade 1881–90 was 22·5; it fell from 21 in 1890 to 20 in 1891, and stood at that figure till the end of the ensuing decade, except in 1897 and 1898, when it was 21. On the other hand, the ratio of lunatic poor per thousand of estimated population has risen from 1·8 in 1868 to 3·1 in 1900, the increase being undoubtedly due, in part at least, to the fact that greater care has been taken to segregate this class of the population, coupled with a growing disinclination of the working classes to be burdened with the mentally weak in the home.

Crime.—Although the prison accommodation in the large centres of population is more and more taxed every year, crime continues to decline steadily, as is shown by Table IX., albeit the figures for 1898 indicate a set back from 1897:—

TABLE IX.—*Classifying Crimes.*

Offences.	Average.					1900.		
	1884–88.	1888–92.	1893–97.	1891–95.	1896–1900.	Males.	Females.	Total.
Against person	789	685	656	663	643	565	66	631
Against property, with violence	565	547	601	581	594	610	33	643
Against property, without violence	895	906	831	862	840	627	170	797
Against property, malicious	82	42	31	30	24	14	2	16
Forgery, &c.	42	33	23	31	24	18	4	22
Other offences	104	123	82	107	61	52	6	58
Total	2477	2336	2224	2283	2186	1886	281	2107

Communications.—By the Local Government Act of 1889 the oversight of the roads in Scotland was transferred from the Road Trustees to county councils, and the management is in practice in the hands of district committees, composed of representatives of the county council and the parish councils of the district. Table X. shows the development of railway communication in Scotland. The total capital of all the railway companies in 1888 was £114,120,119; in 1898 it had been raised to £158,982,782—paid up and raised by loans and debenture stock.

TABLE X.—*Illustrating Growth of Railway Communications.*

Year.	Miles.	Passengers.				Receipts.		
	Open.	First Class.	Second Class.	Third Class.	Total.	Passenger.	Goods.	Total.
1884	2909	4,711,500	2,715,932	46,877,042	54,305,074	£2,931,737	£4,426,023	£7,357,760
1888	3097	4,026,971	1,043,992	62,142,386	68,413,319	3,103,105	4,504,627	7,094,427
1898	3476	4,718,024	..	109,389,421	114,107,445	4,350,182	6,105,581	10,873,318
1900	3485	5,875,084	..	116,825,118	122,201,102	4,715,592	6,431,693	11,003,010

The total disappearance of the second-class passenger from Scotland during the decade ended in 1898 will be noted, together with the almost constant number and real decrease of the first-class passengers. From the passing of the Light Railways Act of 1896 down to the end of 1898, the Board of Trade had sanctioned the construction of nine light railways in Scotland, with a total mileage of 66¾.

Agriculture.—The distribution of land in respect of ownership has not suffered an appreciable change since 1875. Table XI. is a comparative statement of the number and acreage of holdings in each class above five acres in the years 1885 and 1895:—

TABLE XI.—*Illustrating Distribution of Holdings above Five Acres.*

Years.	5 to 20 Acres.		20 to 50 Acres.		50 to 100 Acres.		100 to 300 Acres.		300 to 500 Acres.		500 to 1000 Acres.		Above 1000 Acres.		Total.	
	No.	Acres.	No.	Acres.	No.	Acres.	No.	Acres.	No.	Acres.	No.	Acres.	No.	Acres.	No.	Acres.
1885	22,132	236,995	10,677	361,675	9778	725,499	12,549	2,139,138	2034	768,823	632	409,641	90	137,104	57,892	4,778,870
1895	23,104	245,664	10,817	363,266	9834	731,977	12,968	2,203,207	2070	782,369	620	397,682	76	104,410	59,489	4,828,575

The table contains striking evidence of the reversal of the tendency, long prevalent, to abolish the lowland crofting class, and of the natural reversion to the division of land into farms of manageable size. There were altogether 54,071 holdings in 1895 under 50 acres (including 20,150 under 5 acres), or 67·89 of all the holdings in Scotland.

Since the passing of the Crofters Act of 1885, and the amending statutes of succeeding years, which added to the Commissioners' powers of fixing fair rents and cancelling arrears, the power of enlarging crofts and common grazings, political agitation among the Highland crofters has practically died out. The material condition of the class has not very markedly improved, except where, by Government assistance, crofter fishermen have been enabled to buy better boats; but in some districts, even in the Lewis, superior houses have been built. The Crofters' Commission has been continuously at work since 1886, and had up to the end of 1898 dealt with 19,862 applications to fix fair rents, covering 192,283 acres held in individual occupancy, and 1,243,328, acres of grazings or common hill pasture. The total amount of the fair rents fixed was £59,420, and the total amount of reduction on the old rents £21,446.

Of £183,930 of arrears of rent, £123,651 was cancelled; and 41,452 acres was assigned in enlargement of existing holdings. Under a Congested Districts (Scotland) Act of 1897, a Board expends £35,000 a year of public moneys, within certain districts of Argyll, Inverness, Ross and Cromarty, Sutherland, Caithness, Orkney and Shetland, in assisting migration, improving the breeds of live stock, building piers and boatslips, making roads and bridges, developing home industries, &c. Deer forests in 1899 covered 2,287,297 acres—an increase of 575,405 acres since 1883.

The epoch of agricultural depression which set in prior to 1885 was surmounted in Scotland with comparatively little trouble. A large amount of capital was lost by tenants, and a few farms were thrown here and there upon the landlords' hands, but in no district was rent extinguished or were holdings abandoned. The sub-commissioners who reported to the Royal Commission on Agriculture in 1895, found nearly everywhere a demand, sometimes competition, for farms, persisting throughout the crisis. In Banff, Nairn, Elgin, and the seven counties south of the Firth of Forth rent reductions varied from 25 to 30 per cent. In Perth, Fife, Forfar, and Aberdeen the average was 30 per cent.; but in all the counties of both groups, towards the end at least of the period of depression, the coexistent demand and competition for farms were observable. In some districts of the western division of the country rents fell very little; in others, especially sheep-farming districts, the fall was very severe. In Ayrshire the figure varied from 5 to 20 per cent.; for Dumfriesshire 16 per cent. was given as a fair average, but here too the distressed farmer was compelled to admit that if he gave up his holding there were others ready to take it. Now, owing to the increased attention given to stock-fattening, dairying, &c., and to a rise in prices all round, farming has reached a condition of equilibrium, and the most noticeable residuum of the period of depression is the large intrusion of the butcher and grazier class into the farmer class proper. Caithness-shire was declared to be the greatest sufferer by the period of depression; rents fell in that county by 30 to 50 per cent. on large farms, 20 to 30 per cent. on medium, and 10 to 60 per cent. on small farms. Table XII. shows the total area, the cultivated area, and the area under each kind of crops in 1888 and 1901: —

TABLE XII.—*Illustrating Acreage under Cultivation.*

Total Area (Foreshore excluded), 19,455,788 Acres.	1888.	1901.
Cultivated acreage	4,878,514	4,900,131
Permanent pasture	1,191,648	1,428,224
Arable land	3,686,866	3,471,907
Corn crops:		
Wheat	68,735	36,225
Barley or bere	223,468	235,115
Oats	1,015,395	956,389
Rye	9,690	5,541
Beans	15 738	13,037
Peas	1,423	1,349
Total corn crops	1,336,338	1,247,656
Green crops:		
Potatoes	157,605	130,176
Turnips	480,626	458,556
Mangolds	1,345	2,950
Cabbage, kohl-rabi, and rape	6,884	14,404
Vetches or tares	13,851	9,016
Other green crops	2,848	2,384
Total green crops	663,159	617,486
Grasses under rotation	1,668,453	1,593,461
Flax	327	4
Small fruit	3,416	6,079
Bare fallow	15,083	7,221

The most notable movement in corn crops, if we except the revival in a limited area of wheat-growing, has been in barley, the acreage of which responded to the rapid development of distilling in Scotland up to 1899. In regard to green crops, the figures relating to cabbage, &c., and to small fruit reflect the development of market-gardening in the neighbourhood of the large towns. The area under orchards rose from 1562 in 1880 to 2149 in 1898. Woods and plantations covered 811,703 acres in 1880 and 878,765 acres in 1895, of which 54,956 acres had been planted between 1881 and 1895.

Table XIII. shows the yield of the principal crops per acre in 1888 and 1899, with the average yield per acre in 1899:—

TABLE XIII.—*Showing Yield of Chief Crops per Acre.*

		1888.	1899.	Average per Acre. 1899.
Wheat	Bushels	2,139,282	1,768,320	37·42
Barley	,,	7.630,661	8,222,891	34·19
Oats	,,	34,986,742	33,313,304	34·73
Beans	,,	409,535	439,613	33·66
Peas	,,	26,740	26,515	24·04
Potatoes	Tons	767,271	649,428	5·11
Turnips	,,	6,218,905	5,751,738	12·23

Table XIV. shows the number of live stock in 1888 and 1901:—

TABLE XIV.—*Illustrating Increase of Live Stock.*

	1888.	1901.
Horses used for agriculture	146,913	153,918
Unbroken horses and breeding mares	42,874	40,975
Total	189,787	194,893
Cattle:		
Cows or heifers in milk or calf	410,256	433,981
Other cattle, 2 years and above	249,156	274,016
Under 2 years	450,878	521,284
Total cattle	1,110,290	1,229,281
Sheep:		
One year and above	4,431,535	4,627,066
Under one	2,299,032	2,774,343
Total	6,730,567	7,401,409
Pigs	154,599	124,821

The table shows, when collated with Table XIII., the extent to which Scottish farmers have turned their attention to stock-raising in preference to crop-raising. The cow stock of the country has risen steadily, and the regular increase of the number of cattle under one year points to the breeding industry being in a healthy state. Horse-breeding, as indicated by the numbers of unbroken horses and breeding mares, is a declining industry; it reached its maximum of prosperity in 1894, when the number of horses in the class named was 51,740.

Fisheries.—The development of the Scottish fisheries during the past decade is exhibited in Table XV.:—

TABLE XV.—*Showing Growth of Fisheries.*

	Total taken by Net and Line.			Total taken by Trawl.			Total Quantity and Value of Fish landed.		
	Cwt.	£	Price per Cwt.	Cwt.	£	Price per Cwt.	Cwt.	£	Price per Cwt.
1890	5,380,715	1,205,809	4/10	201,812	203,620	13/11	5,864,488	1,623,340	5/6
1898	5,774,331	1,420,033	4/11	783,436	453,233	11/7	6,657,708	1,879,866	5/8
1900	4,202,183	1,622,567	7/7	1,077,082	703,127	13/1	5,309,265	2,325,904	8/8

While net-fishing has not been at a standstill, the great progress of the fisheries has been due to the multiplication of beam-trawling vessels, in which a large amount of capital has been invested, and whose operations have scarcely been checked by the closing of the Moray Firth and other inshore waters to all but line boats. Line-fishing has suffered a decided set-back. For instance, while 1,420,789 cwt. of round fish were caught by line in 1890, only 650,000 cwt. were caught by line in 1900; trawlers landed 171,593 cwt. in 1890, and 892,000 cwt. in 1900. Trawlers have to go farther and farther afield for their fishing-grounds, and the line fishermen on the east coast are to some extent adapting themselves to changed conditions by employing larger boats, and in some cases having them propelled by steam; on the west coast, on the other hand, the tendency is towards the employment of smaller boats. In 1900, 82,809 persons were employed in connexion with the various branches of the sea fisheries; the fleet of fishing vessels numbered 11,275, manned by 40,192 fishermen; and total value of the fish landed on Scottish coasts was £2,401,900 (as against £2,270,484 in 1899 and £1,957,000 in 1898), made up of: herring, £1,248,407; sprats, £1876; sparling, £1086; mackerel, £5025; cod, £205,994; ling, £51,210; tusk, £2295; saithe, £12,208; haddocks, £512,660; whiting, £35,444; conger eel, £7765; turbot, £18,325; halibut, £40,801; sole, £41,688; flounder, plaice, and brill, £109,829; skate, £20,659: other white fish, £25,658; shell-fish, £75,906.

Mining Industries.—Table XVI. exhibits the development of the mineral industry of Scotland since 1885 so far as statistics are available:—

TABLE XVI.—*Illustrating Development of Mining Industry.*

	1885.		1895.		1900.

Imports of Iron Ore.						
	2,832,598	1,957,199	4,450,311	2,977,952	1,371,684	1,171,026

Pig-Iron Production.

	1885.	1895.	1900.
Furnaces in blast	92	76	85
Output in tons	1,003,562	1,048,774	1,156,885

Coal is found in 15 Scottish counties. Of the total output since 1876, Lanark contributed 55·90, Ayr 14·35, Fife and Kinross 11·95, Stirling 6·05, Edinburgh 3·75, Linlithgow 2·80, Dumbarton and Clackmannan each 1·40, Haddington 1·20, Renfrew 0·35, and Argyll, Dumfries, Perth, and Sutherland together 0·85. The total quantity worked up to the end of 1898 was 1,514,062,000 tons, and the quantity then remaining to work was estimated at 4,634,785,000 tons. The export of coal from the principal Scottish ports rose from 5,800,000 tons in 1889 to 9,000,000 tons in 1899. Lanark produces about 46 per cent. of the fire-clay production, and Ayr comes next with about 16 per cent.; Edinburgh, Renfrew, and Stirling are the other counties in which the mineral is found in quantity. Ayrshire, with an output of 36 per cent. of the whole, is the principal iron-mining county; Renfrew follows with 20 per cent., and Lanark with 18 per cent.; iron ore is worked also in Edinburgh, Linlithgow, and Dumbarton on a considerable scale. Oil shale is found in Linlithgow, Ayr, Lanark, Stirling, and Renfrew; but more than half the total output is credited to Linlithgow, where the principal refining works are situated. Argyllshire furnishes the bulk of the slate production. Limestone is found mainly in Lanark, Renfrew, Banff, Ayr, Stirling, and Haddington, in the order stated. Granite occurs in Aberdeen, Kirkcudbright, Argyll, Kincardine, the Aberdeen production being 69 per cent., of Kirkcudbright 15 per cent., and of Argyll 10 per cent., of the whole.

There are 25 iron-works in Scotland, and all were in active operation in 1900. They are owned by 22 firms and employ about 7000 operatives. The product consists of all classes of malleable iron—bars, angles, tees, hoops, strips, sheets, and plates, and amounts to some 350,000 tons per annum. There were working in the West of Scotland in 1900 about 115 open-hearth Siemens-Martin steel furnaces, ranging in capacity from 50 down to 20 tons per furnace. The average output per furnace is 210 tons a week—total, 24,150 tons; and the total produce of the year of 48 working weeks, 1,149,200 tons of ingot steel. There are also 2 Bessemer converters, which produce about 1000 tons weekly, so that the output of ingot steel in West Scotland is nearly 1¼ million tons.

Manufactures.—The detailed statistics for 1890 about the manufactures exhibit the following facts:—The woollen industry has the widest spread of all the textiles. There were in that year 2 wool-spinning factories in the northern district, 2 in the north-western, 8 in the north-eastern, 23 in the east midland, 8 in the west midland, 14 in the south-western, 14 in the south-eastern, and 14 in the southern. In 1900 there were 256 worsted and woollen factories, and 91 hosiers' and wool workshops. Weaving has its principal seats in Hawick, Galashiels, Dumfries, Elgin, Aberdeen, Inverness. Table XVII. shows the progress made in the previous decade:—

TABLE XVII.—*Illustrating Growth of Woollen Industry.*

	Factories.	Spindles.		Power Looms.	Persons employed.		
		Spinning.	Doubling.		Male.	Female.	Total.
1878	246	559,021	62,013	6284	10,083	12,584	22,667
1890	282	565,146	73,978	9836	12,915	18,162	31,077

The employés in this industry numbered 29,218 in 1897.

The linen industry is confined mainly to the counties of Forfar, Fife, Aberdeen, Perth, and the speciality of thread-spinning to Paisley. Table XVIII. offers a comparison between its condition in 1878 and 1890, and it may be said generally that the persistence of hostile tariff legislation in the United States has prevented a recurrence of its former activity:—

TABLE XVIII.—*Illustrating Growth of Linen Industry.*

	Factories.	Spindles.		Power Looms.	Persons employed.
		Spinning.	Doubling.		
1878	155	265,263	18,495	16,756	36,476
1890	136	187,755	20,599	18,687	34,222

There were in 1890, 27 hemp factories, with 14,450 spinning and 1735 doubling spindles and 3216 employés; and 103 jute factories, with 242,205 spinning and 10,868 doubling spindles, 12,897 power looms, and 13,007 male and 26,878 female employés. In 1900 factories engaged in flax, jute, hemp, and tow numbered 243.

Cotton manufacture has stagnated in Scotland as compared with England, and it is certain that there has been no development of the industry since the publication of the last official statistics. Table XIX. gives particulars for 1875, 1885, and 1890. The most important factories are still confined to Glasgow and neighbourhood:—

TABLE XIX.—*Illustrating Growth of Cotton Industry.*

	Factories.	Spindles.	Power Looms.	Persons employed.
1875 .	96	1,711,214	29,171	35,652
1885 .	147	1,149,514	19,684	37,167
1890 .	124	1,204,113	28,093	34,878

The employés numbered 29,540 in 1897. In 1900 there were 92 cotton factories and 18 textile workshops engaged in cotton.

The textile industry that has made most marked progress in Scotland is the weaving of lace curtains, which is carried on chiefly in a number of Ayrshire towns and in Glasgow. In 1878 there was only one lace factory, employing 45 hands; in 1890 there were 19 factories, with 2087 hands; and the number has increased since. There were 11 silk factories in the south-western district in 1890, with 7917 spindles and 734 power looms, employing 1334 hands (2244 in 1897). Table XX. shows particulars of all textile factories in Scotland subject to the Factories and Workshops Acts for a series of years:—

TABLE XX.—*Illustrating Position of all Textile Factories.*

Years.	Factories.					Number of Spindles.		Number of Power Looms.
	Spinning.	Weaving.	Spinning and Weaving.	Other.	Total.	Spinning.	Doubling.	
1875	229	195	211	45	680	2,436,947	446,429	74,195
1885	251	221	190	114	776	1,725,173	643,931	72,279
1890	220	227	184	116	747	1,713,899	699,836	71,471
1900	...	...	...	...	725	...	...	...

The Scottish industries that have made decided progress are the manufacture of iron and steel, of which statistics are given above, and distilling and brewing. In the year 1900, out of a total of 199 distilleries at work in the United Kingdom, 159 were situated in Scotland. Table XXI. gives an indication of the progress of distilling and brewing actually and relatively to the United Kingdom:—

TABLE XXI.—*Illustrating Growth of Distilling and Brewing.*

	Scotland.		United Kingdom.	
	1890.	1900.	1890.	1900.
	£	£	£	£
Spirit duty .	4,372,400	7,650,675	13,860,002	20,124,003
Beer duty .	441,542	746,894	9,410,426	13,940,536
Total excise net receipt .	5,158,096	8,397,569	27,127,651	34,064,539

The number of gallons of whisky distilled in Scotland in 1900 was 31,798,465 (United Kingdom 59,246,277), compared with 21,472,441 in 1894 and 20,164,962 in 1884. The number of barrels of beer brewed in Scotland (in Edinburgh, Leith, and Alloa chiefly) was 2,137,030 in 1900 (United Kingdom 36,394,565), compared with 1,744,512 in 1894. The number of barrels retained for home consumption in 1899 was 1,918,426, compared with 1,425,769 in 1890.

The cheapness of sugar, while it ruined the refining industry of Greenock, brought about an enormous development of the manufacture of confectionery and preserves in Scotland, and helped, with the increase in the importation of flour, to develop the bakery trade. Preserve and confectionery making is, however, mainly confined to Glasgow, Edinburgh, Dundee, and Forfar. Printing continues to be one of the most important industries of Edinburgh, linoleum and floor-cloth manufacture of Kirkcaldy, granite-polishing and comb-making of Aberdeen. The manufacture of chemicals has its principal seat in Glasgow and neighbourhood, the manufacture of explosives in Ayrshire. German competition has almost killed the glass-bottle industry, and all the important potteries are concentrated in Glasgow, Edinburgh district, and Fife. The other widely spread industries of the country do not call for special notice.

Commerce and Shipping.—In order of commercial importance the ports of Scotland now stand as follow: Glasgow, Leith, Dundee, Grangemouth, Greenock, Aberdeen, Kirkcaldy, Granton. Table XXII. shows the net tonnage registered at Scottish ports for 1889 and 1900:—

TABLE XXII.—*Showing Registered Tonnage in Port for 1889 and 1900.*

	1889.		1900.	
	No.	Tons.	No.	Tons.

	£	£
1889 . .	36,771,016	22,310,006
1898 . .	36,224,982	23,643,143
1900 . .	38,691,245	32,166,561

Foreign and colonial merchandise transhipped was valued at £989,289 in 1889 and £738,440 in 1900. The customs revenue rose from £1,965,080 in 1894 to £2,305,259 in 1900.

Notwithstanding one or two set-backs, shipbuilding made steady and satisfactory progress, chiefly on the Clyde. Table XXV. gives details of the Scottish output in each of the years from 1895, showing the decadence of sailing shipbuilding, the progress made in steam shipbuilding, and the increase in the size of the steamers turned out:—

TABLE XXV.—*Illustrating Position of Shipbuilding Trade since 1895.*

	Sailing Vessels.		Steamers.		Total.

National Wealth.—The total amount of property and profits assessed to the income tax in Scotland was £61,125,422 in 1885 and £75,833,242 in 1900, the total remaining almost a constant tenth of the total for the United Kingdom. Real property under Schedule A increased in annual value from £19,790,187 in 1885 to £22,949,891 in 1900, and the amount under Schedule D (profits and trades) from £30,879,677 in 1885 to £45,390,788 in 1900. The amount which the Post Office and Trustees Savings Banks owed depositors in Scotland increased by about 250 per cent. between 1884 and 1900, the figure for the former year being £8,612,910 and for the latter £21,568,415; and while the Scottish total was little more than an eleventh of the total for the United Kingdom in 1894, it was between an eighth and a ninth in 1898. Joint-stock companies registered in Edinburgh averaged 268 yearly in 1891–1900, with an average total capital of £12,330,313. The total paid-up capital of the Scottish banks, 10 in number, at date of balance in 1901 was £9,302,000, and their total assets, £138,317,871.

Universities and Schools.—The four Scottish universities—St Andrews, Glasgow, Aberdeen, and Edinburgh—had in 1899, 128 professors in all and 97 lecturers. Radical changes were made in their constitution by an Act of 1889 and a Royal Commission which carried out its provisions. The University Court of each was made supreme authority in regard to finance, discipline, and the regulation of the duties of professors and lecturers; the universities were empowered to affiliate other academical institutions; an entrance examination was instituted; and large options were introduced into the course of study and the subjects of examination for old and new degrees; and women students were admitted on an equal footing with men. Under the Act the University College of Dundee was incorporated with the University of St Andrews, and Queen Margaret College became a part of the University of Glasgow, the buildings and endowments, which are used for women students exclusively, being handed over to the University Court. St Mungo's College, Glasgow, incorporated in 1889 under a Board of Trade licence, has medical and law faculties, and Anderson's College Medical School, Glasgow, was instituted in 1887. These are on the same footing as the extra-mural Edinburgh medical schools, their medical curricula qualifying for licence only, and not for Scottish university degrees. The Glasgow and West of Scotland Technical College, instituted in 1886 by the union of the non-medical part of the Andersonian University and other institutions in Glasgow, and the Heriot-Watt College, Edinburgh, incorporated under the Educational Endowments Act of 1882, are the leading technical schools of Scotland, and there are schools of almost equal rank at Aberdeen, Paisley, Coatbridge, and elsewhere. By the erection of chairs and lectureships in education, and otherwise, the training of teachers has been brought into closer touch with the universities, but the separate normal schools managed by the Churches are still carried on—the Established and Free Churches having each schools for both men and women in Edinburgh, Glasgow, and Aberdeen, the Episcopal Church a training school for women in Edinburgh, and the Roman Catholic Church one for women in Glasgow.

The secondary education system of the country has been largely reformed. After the reorganization of the Scottish Education Department in 1885, when it was separated from the English Department, it undertook the inspection of higher class schools; two years later it instituted a leaving certificate, which has, in conjunction with inspection, improved the efficiency of these schools, and also of the secondary departments of elementary schools, to which it was applied in 1893; 86 higher class schools (public, endowed, and voluntary) are under inspection, and pupils from 398 schools sat for the leaving certificate in 1898. In 1898 the functions of the Science and Art Department, as far as Scotland is concerned, were transferred to the Department, and arrangements are being made for spending part of the money available in encouraging school boards to provide organized course of instruction for children who have passed the elementary stage of education. Parliament has since 1892 subsidized secondary education under an Education and Local Taxation Act of that year, some £50,000 being dispensed by burgh and county committees, specially elected, to the managers of public secondary schools and the higher departments of elementary schools, and a further sum was made available by a Local Taxation Account of 1898 for similar purposes. A Technical Schools Act was passed in 1887, and has been applied by a few local authorities; but under an Act of 1890 burgh and county councils were empowered to expend a State subvention known as the "Residue" grant in supporting technical education, and about two-thirds of a sum which averages nearly £50,000 is either spent by the councils directly in subsidizing technical, science, and art institutions and classes, or handed over to the county committees mentioned above for allocation. In 1900 a Bill was introduced into Parliament which proposed to reconstitute the burgh and county committees, to give them complete control of the moneys mentioned above, and considerable

powers of supervision and guidance in regard to secondary and technical education.

Table XXVI. shows the progress that has been made in elementary education since the passing of the Education Act in 1872 :—

Table XXVI.—*Illustrating Educational Progress since 1872.*

	1872.	1880.	1890.	1900.
Estimated population . .	3,395,808	3,705,314	4,109,275	4,324,944
Number of schools inspected .	1,979	3,064	3,076	3,135
Accommodation . . .	281,688	602,054	714,865	893,842
Average attendance :				
Day scholars	213,549	404,618	512,690	626,089
Evening scholars . . .	3,653	14,297	11,636	43,962
Number of teachers :				
Certificated	2,566	5,330	7,745	10,845
Assistant	..	444	1,320	2,418
Pupil	3,642	4,582	3,883	3,926

The percentage of average attendance to estimated population increased from 12·08 in 1884–85 to 14·48 in 1899–1900. For the purposes of education in Scotland there was raised by rates in 1898–99, £861,078, by an average rate of 9·25 pence compared with 9·23 in the previous year ; by voluntary subscriptions, £28,883 ; in lieu of school fees there was granted to boards and managers, mostly out of a parliamentary vote, £367,618 ; and the ordinary parliamentary vote for day schools under inspection amounted to £677,964—total, £1,935,543. Thus the cost of maintenance per child in average attendance was in public schools £2 13s. 7¾d., in voluntary schools £2 6s. 9d. School fees were almost entirely abolished in 1889, and the loss is made up mainly by annual parliamentary grant and partly by a proportion, earmarked for the purpose, of the proceeds of imperial taxation diverted to local purposes under various Acts. Down to March of 1900, £7,684,577 had been spent in Scotland since 1872 in building public schools. The most important change effected in the elementary education system was the abolition of individual inspection of the lower standards, which was brought about in 1886. This reform has since been extended to the whole of the standards, and inspectors now apply a collective test to the efficiency of a school. By the Code of 1899 a merit certificate was instituted, which at once fixes a standard of attainment for pupils who have passed through an elementary school course, and qualifies for entrance upon courses of higher education in higher grade schools or departments which managers were, by the same code, liberally encouraged to organize for systematic instruction in science, subjects appertaining to commerce, or specially suited to girls. A Superannuation Act for teachers was passed in 1898.

Churches.—For the history of the Scottish Churches in recent years reference may be made to the separate articles, Scotland, Churches of, and Scotland, the Episcopal Church in. Table XXVII. gives comparative statistics (up to the union of the Free and United Presbyterian bodies in 1900) for the three Presbyterian Churches which command the allegiance of the bulk of the people of Scotland :—

Table XXVII.—*Illustrating Distribution and Contributions of Presbyterian Churches.*

	Congregations.		Members.		Contributions.	
	1885.	1899.	1885.	1899.	1885.	1899.
Church of Scotland.	1479	1770	565,261	648,476	£366,431	£484,275
Free Church . .	1067	1109	329,451	404,828	626,028	712,742
U.P. Church . .	543	589	177,517	197,476	387,355	428,106

The membership of the Free Church included in 1899, 111,144 adherents who were not communicants. The Reformed Presbyterian Church had in 1899 2 presbyteries and 12 churches ; the Original Secession Church, 4 presbyteries and 29 charges ; the Evangelical Union Church (the section which refused to unite with the Congregational Union in 1896), 10 charges ; and the Free Presbyterian Church, which separated from the Free Church on account of the Declaratory Act of 1892, had 12 congregations. The Congregational Union of Scotland embraced 184 churches in 1899 ; the Baptist Union of Scotland had 109 churches and 15,260 members ; the Wesleyans had 44 congregations and missions and 8502 members. The Episcopal Church of Scotland had 356 congregations, including missions, in 1899, 114,315 members, including 45,571 communicants, and raised £110,178 ; the corresponding figures for 1885 being 250 churches, 80,000 members, and 30,000 communicants. The Roman Catholic Church had in 1898, 346 churches, chapels, and stations, compared with 327 in 1885, and its missions numbered 209, while the "Catholic population" was 413,000, as against 340,000 in 1885.

Local Administration.—A large number of new police burghs have been formed since the passing of the Burgh Police (Scotland) Act, which consolidated burgh law and enlarged the powers of police commissioners. But the most important change introduced into local administration during the latter part of the 19th century was effected by the Local Government Act of 1889, which constituted county councils and abrogated nearly all the powers of the commissioners of supply. The council of each county exercises (with two exceptions) the whole powers and functions of the commissioners of supply and of the old Road Trust, acts as local authority under the Contagious Diseases (Animals) Act, as local authority under the Public Health Acts in all parishes (burghs and police burghs excluded), and performs all the administrative duties formerly committed to the justices of the peace. Only the judicial powers of the justices were left to them, and the principal function now discharged by the commissioners of supply is the appointment of half (the county council appointing the other half) of the members of the standing joint committee, which manages the county police, and whose consent in writing must be obtained before the county council undertakes any work involving capital expenditure. All but the smallest counties are subdivided into districts, and the Road Acts and the Public Health Acts are administered in these areas by district committees, composed of members of the county council and representatives of the parish and burgh councils of the district. The county council may also enforce the Rivers Pollution Act within the area under its jurisdiction. Another Local Government Act for Scotland was passed in 1894, by which the Board of Supervision was replaced by a Local Government Board, composed of the secretary for Scotland, the solicitor-general, and the under-secretary, and three appointed members—a vice-president, an advocate, and a medical practitioner. Parochial boards were abolished, and provision was made for the election in every poor-law parish of a parish council, to which the powers of the parochial board were transferred in regard to poor law, vaccination, registration, burial-grounds, &c. New powers conferred on the parish councils include the following :—A parish council may take over the management of any parish trust at the option of the trustees, and may accept the charge of churchyards, and move the county council in the matter of vindicating rights of way, or the formation of special lighting or scavenging districts ; and is entitled to the majority of seats in the sub-committee appointed to manage the affairs of such districts. The parish council may acquire recreation grounds, act as managers under the Allotments Acts, and may lease land for allotments ; and has certain powers of ensuring that the public health of its parish is properly looked after by the county council or district committee. (W. WA.)

Scotland, Churches of.—The history of the Churches in Scotland during the last quarter of the 19th century was marked by increased ecclesiastical activity and a considerable decline in church-going, the number of baptisms, and the attendance at Sunday schools. The number of congregations of all denominations was 3827 in 1879 and 4248 in 1899—an increase of 421. During the same period the population increased by 580,151, so that the addition to the number of congregations kept pace fairly well with the addition to the population; there were 987 persons per congregation in 1879 and 1002 persons per congregation 1899. On the other hand, censuses of church attendance, taken in a number of urban and rural communities in 1876 and 1896, showed that the average best attendance per thousand members at the churches of the three leading Presbyterian bodies in these places had fallen from 861 in the former to 636 in the latter year, and it is estimated that there is probably a churchless population in Scotland equal to 37½ per cent. of the whole, or more than 1,600,000 persons. The indifference of the age was, however, constantly combated, not only by church-planting, but by numerous additions to the Church agencies for Christian work. The labours of the Church of Scotland Committee on Christian Life and Work were emulated by the other Presbyterian Churches, and many elaborate inquiries into such subjects as the religious condition of the people resulted in the creation of new organizations for stimulating the religious sentiment, and checking the tendency to lapse from Church connexion. But the Committee on Life and Work kept the lead which it established in 1875, at least in devising novel aids to the parish minister. Women's work in the Church was fully recognized by the Assembly of the Establishment in 1886, and a Young Women's Guild and

Order of Deaconesses were founded, with a training home and Deaconess Hospital. Six years, from 1890 to 1896, were spent by a committee of the same Assembly in investigating all over Scotland the "state of religion and morals," and in preparing a series of interesting reports thereon; and a similar function is performed by a standing committee of the Free Church on Religion and Morals. The standard of parochial and congregational activity was everywhere raised; most congregations have agencies for overtaking different departments of socio-ecclesiastical work, in which the laity co-operate with the clergy; Young Men's Guilds, especially in the Church of Scotland, have an undoubted vitality; and the Free Church, at all events, has grappled seriously with the problem how to rid itself of inefficient ministers.

Concurrent with this evangelical energizing was a decided growth of tolerance and liberality of thought and scholarship in all the Presbyterian Churches. In contrast with the immediately preceding period, it was the Free Church, rather than the Establishment, that was, during the last twenty years of the 19th century, most "troubled" by advanced thinkers and scholars among its clergy; and while it constantly swelled the roll of its bold and distinguished Biblical critics and liberal thinkers, since the removal of the late Professor Robertson Smith from his chair in the Aberdeen College in 1881, it steadfastly refused to permit a prosecution for heresy; while the Established Church indulged in a heresy hunt so lately as 1896–97, when the Rev. Alexander Robinson, minister of Kilmun, was deposed for refusing to recant the views expressed in his book, *The Saviour in the Newer Light.* Development in the Church of Scotland in this respect has taken the line of mutual tolerance of the High, Broad, and Evangelical schools, which have marked themselves off more clearly from one another, while freely recognizing each other's right to be within the Church. The first-named school founded in 1892 the Scottish Church Society, "to defend and advance Catholic doctrine as set forth in the Ancient Creeds and embodied in the Standards of the Church of Scotland"; and the Kilmun prosecution was followed by the foundation of the Scottish National Church Union by members of the Broad school. In the Free Church the College chairs were almost uniformly filled by advanced critics or theologians, inspired more or less by Professor A. B. Davidson, who went to the Hebrew chair in the New College, Edinburgh, in 1863. Dr A. B. Bruce (author of *The Training of the Twelve*, &c., d. 1899) was appointed to the chair of Apologetics and New Testament Exegesis in the Glasgow College in 1889. Henry Drummond (author of *Natural Law in the Spiritual World*, &c., d. 1897) was made lecturer in Natural Science in the same College in 1879, and became professor in 1883; and Dr George Adam Smith (author of *The Twelve Prophets*, &c.) was called to the Hebrew chair in 1892. Attempts were made between 1890 and 1895 to bring all these professors, except Davidson, to the bar of the Assembly for unsound teaching or writing, but in every case these were abortive, the Assembly never taking any step beyond warning the accused that "their primary duty was to teach and defend the Church's faith as embodied in the Confession." After the failure of the first movement towards union of the Free and United Presbyterian Churches, the latter paid more attention to the efficient training of its ministry, and in 1891 its College was remodelled so as to furnish a full and regular theological curriculum, similar to those of the University Divinity Halls and the Free Church Colleges.

This Church showed the way to the others, with its Declaratory Act of 1879, in relaxing the stringency of the subscription to the Westminster Confession of Faith. In 1889 the Church of Scotland modified its formula for office-bearers' subscription; and a Declaratory Act, similar to that of the United Presbyterian Church, was passed by the Free Church Assembly in 1892, with the result that a small number of ministers and congregations severed their connexion with the Church and formed the Free Presbyterian Church of Scotland, on strictly and straitly orthodox lines. From 1885 till about 1895 much of the energy of all the Presbyterian Churches was absorbed by the Disestablishment agitation. In the former year the Free Church, having almost entirely shed the Establishment principle on which it was founded, began to rival the United Presbyterian Church in its resolutions calling for the Disestablishment of the Church of Scotland; and while the Established Assembly at first responded with offers to confer with both the dissenting Churches about union, the assaults upon its status waxed in vigour till in 1893 the Free Assembly hailed the result of the general election as a verdict of the constituencies in favour of Disestablishment, and insisted upon the Government of the day taking up Dr Cameron's Disestablishment Bill. The Church of Scotland began to counteract the agitation in 1890 by forming a defence organization all over the country, which was considered to be practically complete in 1895. After the general election of that year, however, the agitation became much less active. During the last four or five years of the 19th century the Free and United Presbyterian Churches devoted the greater part of their energy to arranging an incorporating union between them. The minor Courts of the Free Church first moved in the matter; and the supreme Court of the United Presbyterian Church in 1896 resolved to "take steps towards union." In the following year the Free Assembly responded by appointing a committee to confer with a committee of the other Church. The joint-committee discovered a "remarkable and happy agreement" between the doctrinal standards and rules and methods of the two bodies, and with very little of concession on either side a common constitution and common "questions and formula" for the admission of ministers and office-bearers were arranged. The supreme Courts approved the proposals of the joint-committee, which embraced, besides a Uniting Act, declarations conserving the liberty and privileges of individual members and congregations on either side in various important respects; and the union was completed in October 1900, at a meeting of the first General Assembly of the United Free Church of Scotland. The use of instrumental music was sanctioned in Free churches during this period. The jubilee of the Free Church was celebrated in 1893, and of the United Presbyterian Church in 1897. Church congresses on the English model were held for the first time in 1899 by the Established and Free Churches.

The following table shows the material progress of the principal Churches in Scotland during the last twenty years of the 19th century:—

	1879.	1899.
Population	3,677,558	4,257,709
Congregations—		
Established Church	1,337	1,447
Free Church	1,033	1,101
United Presbyterian	533	577
Other Denominations in 1885	924	1,123
Membership—		
Established Church	518,146	648,476
Free Church	246,250	293,684
United Presbyterian	172,150	195,498
Income—	1885-86.	1889-1900.
Established Church	£311,378	£492,816
Free Church	594,050	706,546
United Presbyterian	367,915	392,116

While the population of Scotland increased by 580,151 in the twenty years, or 15·78 per cent., congregations increased in the Established Church 8·23 per cent., the Free Church 6·58 per cent., the United Presbyterian Church 8·25 per cent., and in other denominations (1885–1899) 21·54 per cent.; and the membership of the Established Church 25·15 per cent., of the Free Church 19·26 per cent., and of the United Presbyterian Church 13·56 per cent. It has to be pointed out, however, that the only thoroughly trustworthy index of progress is the increase of congregations (the Church of Scotland, by the way, completed in 1900 the endowment of 408 new parishes since the Disruption). In the first place, a local reluctance to communicate relegates to the category of "adherents" a body of adults in the Highlands fairly estimated at about 61,500, and by so many diminishes the membership of the Free Church. In the second place, the accuracy of the returns of membership of all the Churches is seriously impugned on the ground of the discrepancy between the death-rate of the country and the death-rates of the communicants of the three Presbyterian Churches; for instance, in 1899 the death-rate for Scotland per ten thousand of the population was 185·78; and of the Church of Scotland per ten thousand communicants 145·20, of the Free Church 181·83, and of the United Presbyterian Church 176·36. In the Free Assembly Reports for 1900 it is correctly calculated that if the death-rate of the communicants of the three denominations were the same as the death-rate of the country, the exact number on the rolls of the Church of Scotland in the middle of 1899 would have been 509,798 (instead of 656,112), of the Free Church 288,622 (instead of 296,085), and of the United Presbyterian Church 188,234 (instead of 199,089).

The greater proportional increase of the congregations of "other denominations" is accounted for mainly by the remarkable growth of the Scottish Episcopal Church. During the last fifteen years of the 19th century, while the population rose by 7·78 per annum, the congregations of this Church increased by no less than 32·63 per 1000 per annum, as compared with 4·11 in the case of the Established Church, 3·29 in the case of the Free, and 4·13 in the case of the United Presbyterian Church.

The Roman Catholic hierarchy was restored in Scotland in 1878. There are six dioceses (with two archbishops, one of Edinburgh and St Andrews and the other of Glasgow), with, in 1900, 452 priests; 358 churches, chapels, and stations; and a Catholic population estimated at 413,400.

The Original Secession Church has 4 presbyteries and 27 congregations; and the remnant of the Reformed Presbyterian Church which did not join the Free Church in 1876, 2 presbyteries and 12 congregations. The Congregational and Evangelical Union (formed by the amalgamation of the Congregational and Evangelical Unions in 1896) has 179 churches; and the remnant of the Evangelical Union, 9 churches. The Baptist Union has 121 congregations, and the Wesleyan Methodists, 49 churches. (W. WA.)

Scotland, The Episcopal Church in, in communion with, but historically distinct from, the Church of England, is composed of seven dioceses: Aberdeen and Orkney; Argyll and the Isles; Brechin; Edinburgh; Glasgow and Galloway; Moray, Ross and Caithness; and St Andrews, Dunkeld and Dunblane. All, except Edinburgh, founded by Charles I., are pre-Reformation sees. The bishops constitute the Episcopal Synod, the supreme Court of appeal, whose president, elected by the members from among themselves, has the style, not the functions, of a metropolitan, being called Primus. The legislature is the Provincial Synod, consisting of the bishops, at whose discretion it is summoned, and a lower chamber of presbyters. The Canons have the authority of this Synod. The Representative Church Council, including laymen, administers finance. Each diocese has its Synod of the clergy. Its Dean is appointed by the Bishop, and, on the voidance of the see, summons the clerical and lay electors, at the instance of the Primus, to choose a bishop, who is presented to the Episcopal Synod for confirmation and to the Primus for consecration. There are cathedrals at Perth, Inverness, Edinburgh, and Cumbrae; the sees of Aberdeen, Brechin, and Glasgow have no cathedrals. The Theological College was founded in 1810, incorporated with Trinity College, Glenalmond, in 1848, and re-established at Edinburgh in 1876. There are 356 congregations, with a total membership of 124,335, and 324 working clergy (1900). No existing ministry can claim regular historic continuity with the ancient hierarchy of Scotland, but the bishops of the Episcopal Church are direct successors of the prelates consecrated to Scottish sees at the Restoration. On the refusal of the bishops to recognize William III. (1689), the presbyterian polity was established in the Kirk, the effect of which on its ecclesiastical status is a matter of theological opinion, but the Comprehension Act of 1690 allowed episcopalian incumbents, on taking the Oath of Allegiance, to retain their benefices, though excluding them from any share in the government without a further declaration of presbyterian principles. Many Non-jurors also succeeded for a time in retaining the use of the parish churches. The extruded bishops were slow to organize the episcopalian remnant under a jurisdiction independent of the State, regarding the then arrangements as provisional, and looking forward to a reconstituted national kirk under a "legitimate" sovereign. A few prelates, known as college bishops, were consecrated without sees, to preserve the succession rather than to exercise a defined authority. But at length the hopelessness of the Stewart cause and the growth of congregations outside the Establishment forced the bishops to dissociate canonical jurisdiction from royal prerogative and to reconstitute for themselves a territorial episcopate. The act of Queen Anne (1712), which protects the "Episcopal Communion," marks its virtual incorporation as a distinct society. But matters were still complicated by a considerable, though declining, number of episcopalian incumbents holding the parish churches. Moreover, the Jacobitism of the Non-jurors provoked a State policy of repression in 1715 and 1745, and fostered the growth of new Hanoverian congregations, served by clergy episcopally ordained but amenable to no bishop, who qualified themselves under the Act of 1712. This Act was further modified in 1746 and 1748 to exclude clergymen ordained in Scotland. These causes reduced the Episcopalians, who included at the Revolution a large section of the people, to what is now, save in a few corners of the west and north-east of Scotland, a small minority. The official recognition of George III. on the death of Charles Edward in 1788, removed the chief bar to progress. The "qualified" congregations were gradually absorbed, though traces of this ecclesiastical solecism still linger. In 1792 the penal laws were repealed, but clerical disabilities were only finally removed in 1864. In 1784 Seabury, the first American bishop, was consecrated at Aberdeen. The Book of Common Prayer, which came into general use at the Revolution, is now the authorized service book. The Scottish Communion Office, compiled by the Non-jurors in accordance with primitive models, has had a varying co-ordinate authority, and the modifications of the English liturgy adopted by the American Church were mainly determined by its influence. Among the clergy of

post-Revolution days the most eminent are Bishop Sage, a well-known patristic scholar; Bishop Rattray, liturgiologist; John Skinner, of Longside, author of *Tullochgorum*; Bishop Gleig, editor of the 3rd edition of the *Encyclopædia Britannica*; Dean Ramsay, author of *Reminiscences of Scottish Life and Character*; Bishop A. P. Forbes; G. H. Forbes, liturgiologist; and Bishop Charles Wordsworth.

Scott, Robert (1811–1887), English divine and classical scholar, was born in 1811 at Bondleigh in Devonshire, of which parish his father was rector. Educated at Shrewsbury School under Dr Butler, he entered Christ Church, Oxford, and after a brilliant university career graduated in 1833 with a first class in *Literæ Humaniores*. In 1834 he won the Latin Essay and was elected fellow of Balliol, where he was tutor from 1835 to 1840. After holding successively the college livings of Duloe and South Luffenham, he was elected in 1854, on the death of Dr Jenkyns, master of Balliol. This office he held, together (from 1861) with that of the professorship of the exegesis of Holy Scriptures, down to 1870, when he accepted the deanery of Rochester. As master of Balliol he kept the college up to the high level it had attained under his predecessor. As a Greek scholar, Dr Scott had few equals among his contemporaries. His great literary achievement, which may be said to constitute his life's work, was his collaboration with Dean Liddell in the great Greek lexicon which bears their name. He died at Rochester on 2nd December 1887.

Scott, William Bell (1811–1890), British poet and artist, son of Robert Scott (1777–1841), the engraver, and brother of David Scott, the painter (*Ency. Brit.* xxi. 543), was born in Edinburgh, 12th September 1811. While a young man he studied art and assisted his father, and he published verses in the Scottish magazines. In 1837 he went to London, where he became sufficiently well known as an artist to be appointed in 1844 master of the Government school of design at Newcastle-on-Tyne. He held the post for twenty years, and did good work in organizing art-teaching and examining under the Science and Art Department. He did much fine decorative work, too, on his own account, notably at Wallington Hall, in the shape of eight large pictures illustrating Border history, with life-size figures, supplemented by eighteen pictures illustrating the ballad of *Chevy Chase* in the spandrels of the arches of the hall. For Penhill Castle, Perthshire, he executed a similar series, illustrating *The King's Quhair*. After 1870 he was much in London, where he bought a house in Chelsea, and he was an intimate friend of Rossetti and in high repute as an artist and an author. His poetry, which he published at intervals (notably *Poems*, 1875, illustrated by etchings by himself and Alma-Tadema), recalled Blake and Shelley, and was considerably influenced by Rossetti; he also wrote several volumes of artistic and literary criticism, and edited Keats, "L.E.L.," Byron, Coleridge, Shelley, Shakespeare, and Scott. He resigned his appointment under the Science and Art Department in 1885, and from then till his death (22nd November 1890) he was mainly occupied in writing his reminiscences, which were published posthumously in 1892, with a memoir by Professor Minto. It is for his connexion with Rossetti's circle that Bell Scott will be chiefly remembered.

Scranton, a city of Pennsylvania, U.S.A., capital of Lackawanna county. It is situated in 41° 24′ N., and 75° 43′ W., on the river Susquehanna, in the north-eastern part of the state, at an altitude of 738 feet. The city is well laid out with broad streets, is divided into 21 wards, is well paved (mainly with asphalt), has a good water-supply, and is well sewered. It is entered by five railways, the Central of New Jersey, the Delaware and Hudson, the Delaware, Lackawanna, and Western, the Erie and Wyoming Valley, and the New York, Ontario, and Western, which afford ample facilities for traffic. Scranton is in the heart of the anthracite coal region, and its industries relate to coal-mining and iron manufacture. In 1900 it contained 710 manufacturing establishments, in which was invested a total capital of $19,954,525. They employed 12,669 hands, and the product was valued at $27,646,418. Of this amount $10,231,139, or 37 per cent., consisted of iron and steel goods. Silk was manufactured to a value of $3,616,885, and foundry and machine shop products to a value of $1,755,909. It is perhaps the chief centre of distribution of the anthracite coal product of the country. In 1900 the assessed valuation of real and personal property was $23,354,046, on a very low valuation; the net debt of the city was but $747,463, and the rate of taxation was $38.70 per $1000. Population (1890), 75,215, showing 64 per cent. increase on the preceding ten years; (1900), 102,026, of whom 28,973 were foreign-born and 521 negroes. Of 28,075 males 21 years of age and over, 2985 were illiterate (could not write).

SCULPTURE.

BRITISH.

DURING the last quarter of the 19th century a great change came over British sculpture—a change so revolutionary that it gave a new direction to the aims and ambitions of the artist, and raised the British school to a level wholly unexpected. It cannot be pretended that the school equals, in technical accomplishment or in richness or elasticity of imagination, the schools of France and Belgium, for these have been built up upon the example of national works of many generations of sculptors during several centuries. British sculptors found themselves practically without a past of their own to inspire them, as there is no truly national tradition; so that with them it was simply a case of beginning at the beginning.

The awakening came from without, brought to England mainly by a Frenchman—Jules Dalou (d. 1902), and two Englishmen who had studied abroad, Alfred Gilbert and Onslow Ford. To Carpeaux, no doubt, the new inspiration was in a great measure due; for Carpeaux, who infused life and flesh and blood into his marble (too much of them to please the lovers of purism), was to his classic predecessors and contemporaries much the same that in painting Delacroix was to David and the cold professors of his formal school. But it was to Jules Dalou that was chiefly due the remarkable development in Great Britain. A political refugee at the time of the Commune, he received

a cordial welcome from the artists of England, and was invited to assume the mastership of the modelling classes at South Kensington. This post he retained for some years, until the amnesty for political offenders enabled him to return to his native land; but before he left, he had improved the work in the schools beyond all recognition. The whole conception of sculpture seemed to be modified, and intelligent enthusiasm was aroused in the students. When he departed, he left in his stead Professor Lantéri, who became a naturalized Englishman, and who exercised an influence equal to that of his predecessor. Meanwhile, the Lambeth Art Schools—where Mr W. S. Frith, a pupil of M. Dalou, was conducting his modelling class under the directorship of Mr John Sparkes—were being maintained with great success. And latterly at the Royal Academy, where in 1901 the professorship of sculpture was revived after many years, the inspiring genius of Mr Alfred Gilbert aroused in the students an enthusiasm curiously contrasting with the comparative apathy of earlier days. British sculpture, therefore, when it is not coloured directly from the Italian Renaissance, is certainly influenced from France. But it is remarkable that in spite of this turning of British sculptors to romantic realism as taught by Frenchmen and Italians, and in spite of the fact that the spirit of colour and decoration and greater realism in modelling, had been brought from abroad, the actual character of British sculpture, even in its most decorative forms, is not in the main other than British.

Nevertheless, there has been shown a strong tendency towards reviving the application of colour in sculpture which has not met with universal approval. Although the polychromatic work of the Renaissance, for example, may keep its place, it is held to clash with the idea of sculptural art; for though there is no absolute approach to imitation, there is a very strong suggestion of it. The use of a variety of marbles and metals, or other materials, such as has been increasingly adopted, does not offend in the same measure, as the result is purely formal. Yet, in the final result, the work becomes not so much sculpture as an "object of art."

Revival of polychromatic sculpture and metal-work.

Indeed, the sculptor has been greatly reinforced by the artificer in metal, enamel, and the like. But the revival of metal-work, cut, beaten, and twisted, however fine in itself, does not help sculpture forward very much. It may even keep it back; for popular and beautiful as it is, it really tends to divert the attention from form to design, and from light and shade, with planes, to ingenuity, in pleasing lines—a very beautiful and elevated art, but not sculpture. As an adjunct, it may be extremely valuable in the hands of a fine artist who does not mistake the mere wriggles and doublings which are the mark of the more extravagant phase of the so-called "New Art," for harmonious "line." But it must always suggest the man with the anvil, shears, and pincers, rather than the man with the clay and chisel. It is mainly to Mr Alfred Gilbert, R.A., that is due the delightful revival of metal-work in its finest form wedded to sculpture, with the introduction of marbles, gems, and the like, felicitous and elegant in invention and ornament, and so excellent in design and taste that in his hands, at least, it is subservient to the monumental character of his sculpture.

The first effectual rebellion against the Classic, and the birth of Individualism, dates back to Alfred Stevens (1817–1875; see 9th edition, vol. xxi. p. 561). The picturesque fancy of the Frenchman Roubiliac (1703–1762), with his theatrical arrangement and skilful technique, had left little mark on the Englishmen of his day. They went on, for the most part, with their pseudo-classic tradition, which Flaxman carried to the highest point. But until Stevens, few in England thought of instilling real life and blood and English thought and feeling into the clay and marble. It was not only life that Stevens realized, but dignity, nobility of form, and movement, previously unknown in English work. Follower though he was of Michael Angelo and the Italian Renaissance, he was entirely personal. He was no copyist, although he had the Italian traditions at his fingers' ends, and his feeling for architecture helped him to treat sculpture with fine decorative effect. Yet even Stevens and his brilliant example were powerless to weaken the passion for the Greek and Roman tradition that engrossed English sculptors—with their cold imitations and lifeless art, pursued in the name of their fetish, "the Antique."

Alfred Stevens, A.R.A.

Until towards the close of the 19th century this pseudo-classic art was blindly pursued by a non-Latin race, and a public favourite like W. Calder Marshall, R.A. (1813–1894) never attempted, except perhaps in the "Prodigal Son," to break away towards originality of thought.

W. Calder Marshall, R.A.

Thomas Woolner (*q.v.*), who had represented a modern heroine as a Roman matron, and had shown in his monument to Bishop Jackson in St Paul's Cathedral an archaic severity and dryness altogether excessive, sought elevation of conception such as brought him applause for his "Tennyson" in portraiture and for his "Virgilia Lamenting the Banishment of Coriolanus"—probably his most admirable and most exquisitely touching work.

T. Woolner, R.A.

Meanwhile, Baron Marochetti, R.A. (1805–1867), an Italian of French parentage, had tried to introduce a more modern feeling, and his "Richard Cœur de Lion" at Westminster evoked great enthusiasm. It is difficult, now, to admire the incongruity of the 12th-century king, mounted on a modern thoroughbred, and raising arm and weapon with an action devoid of all vigour. The intention was excellent and fruitful, notwithstanding, and the statue is not without merit. Later Charles Bell Birch, A.R.A. (1832–1893), with his German training, introduced a new picturesque element in his "Wood Nymph," "Retaliation," "The Last Call," and the "Memorial to Lieut. Hamilton, V.C., dying before Kabul"; but neither the vigour nor the individuality of his work influenced his contemporaries to any extent, doubtless on account of the German aspect in it, the outcome of his training.

Baron Marochetti, R.A.

C. B. Birch, A.R.A.

Sir J. Edgar Boehm, R.A. (1834–1890), an Austrian by birth, was more successful, and his influence, helped by the talent of able studio-assistants (Professor Lantéri, Mr Alfred Gilbert, and others), contributed somewhat to thaw the chill which the cold marble still seemed to shed around. There was not much inspiration in his monument of "General Gordon" in St Paul's Cathedral, and his "Wellington Memorial" is cold and empty, though correct enough; but the "Herdsman and Bull," among his ideal subjects, the "Carlyle" on Chelsea Embankment, among his portrait-statues, had the right feeling in them.

Sir J. Edgar Boehm, R.A.

J. H. Foley, R.A. (see vol. ix., 9th edition), who at first was all for "the unities" and a "pure style," seemed in his later years to throw his previous convictions to the winds, when he produced the finely spirited equestrian statue of "General Sir James Outram," now erected in India. This statue was welcomed with enthusiasm in the art-world, and helped to remind the public that monuments need not be staid to dulness, nor stiff and dead in their imperturbability.

SCULPTURE. Plate II.—BRITISH (*b*).

Meanwhile Mr Henry Hugh Armstead (b. 1828; R.A. 1879), in 1902 the oldest of the living exhibiting sculptors (Mr G. F. Watts is dealt with later), who had begun by devoting himself to the art of the silversmith, fashioning the "St George's Vase," "The Packington Shield," and "The Outram Shield," was working in the spirit of the younger school. He was carrying out commissions of great magnitude—in the Palace of Westminster, and in the Abbey itself, for which he executed the marble reredos with its many figures, the whole of the external sculptural decorations for the Colonial Office in Whitehall, as well as the eighty-four life-sized figures on two sides of the podium of the Albert Memorial, with the four bronze statues, "Chemistry," "Astronomy," "Medicine," and "Rhetoric." Portrait-figures of all ages are here classed together, and the work is a better-sustained piece of designing and carving than is commonly understood. The statue set up at Chatham of "Lieutenant Waghorn" is a good example of Armstead's sculpture, impressive by its breezy strength and picturesqueness; but a more remarkable work, technically speaking, is the memorial to a son of the earl of Wemyss, "David and the Lion," now fixed in the Guards' Chapel. It is in very flat relief; Ninevite in character of treatment, and carved wholly by the artist directly from the living model, it is, in point of technique, one of his best productions. The work of Mr Armstead is monumental in character—the quality which has been so rare among British sculptors, yet the finest quality of all; and in almost everything he does there is a "bigness" of style which assures him his place in the British school.

H. H. Armstead, R.A. First appearance in the Exhibitions (1851).

Following the chronological order of the artists' first public appearance, as being the most convenient and the only consistent method that will prevent overlapping, we come to Mr F. J. Williamson (b. 1853), who executed many works for Queen Victoria; Mr John Hutchison, R.S.A. (b. 1856), a Scottish sculptor of the Classic school; and Mr George A. Lawson, H.R.S.A. Mr Lawson was a pupil of Alexander Ritchie, of the Royal Scottish Academy, and in a measure of Rome. Born in 1832, he came to London in 1867, and soon proved himself one of the best sculptors Scotland has produced. "In the Arena" was his first striking group. "Daphnis" is an excellent example of his Classic life-size work; and "Motherless," one of his greater successes in a more modern and pictorial spirit, a group full of pathetic pathos and free and sympathetic handling. "Callicles," the weary "Danaid," "Old Marjorie," and the statue of "Robert Burns," erected at Ayr—are all in their way remarkable. Mr Lawson's work, which only requires a little more animation to be very fine, has the quality of "style," and is strong, manly, and full of distinction.

G. A. Lawson, H.R.S.A. (1862).

Mr George Simonds (b. 1844) is a product of the foreign schools. He is the author of many monumental works and not a little decorative sculpture, but he is best recognized by ideal subjects, such as "The Goddess Gerd," "The Falconer" (in the Central Park, New York), "Cupid and Campaspe," and "Anemone, the Wind Flower." His treatment of the undraped female figure is refined and delicate, and there is an intellectual reality about his best work, as well as imagination in conception. Mr A. Bruce-Joy (b. Dublin, 1842) has produced ideal work and statues of our public men for public spaces.

G. Simonds (1866).

A. Bruce-Joy.

Mr Thomas Brock (b. 1847), the amount of whose work is prodigious, as well as solid and scholarly, came to London from Worcester in 1866, and entered as a pupil the studio of Foley, whose ablest assistant he soon became, and thus fell early under the influence of the sculptor who was soon to rebel against the formalism that prevailed. Had he gone on he would have become a second Foley; in fact, when his chief died, in 1874, Mr Brock was appointed to carry out the great unfinished works in the studio—the "O'Connell Monument" in Dublin, the "Lord Canning" in Calcutta, and several others. But he felt the foreign current; and even when his style was formed, his career being already assured, he was perceptive enough to modify it, and, so developed, he left his master very far behind. The ideal work that marked this transition was "The Moment of Peril," a fine, scholarly work representing a mounted Red Indian repelling the attack of a great serpent which has thrown his horse to earth. How greatly he improved in technical quality and in refinement of taste is to be seen in the life-sized marble statue called "The Genius of Poetry"—graceful where the "Moment of Peril" was violent in action, reposeful and harmonious where that was vigorous, and sculpturesque where that was anecdotal. A still higher intellectual point was reached in "Song" and in the "Eve," now in the Tate Gallery in London. A similar advance is to be observed in the portraiture of Mr Brock. The statues of "Robert Raikes" (on the Thames Embankment) and "Sir Richard Temple" (in Bombay Town Hall), for example, are finely treated, unconventional figures; but "The Rt. Rev. Henry Philpotts, D.D., Bishop of Worcester," in which the inherent difficulty of a seated figure is happily surmounted, marks the progress. The skill with which the artist has given the drapery, especially of the sleeves, a lightness not commonly seen, is striking. There are no black holes of shadow: the depressions are shallow and of the right shape to hold light even while securing shadow; yet weakness is avoided and crispness is secured by the sharpening of the edge of the folds—the principle which is established in the Pheidian group of "The Fates," for example, among the Elgin Marbles. Other works of importance in the same class are the effigy of "Dr Benson, archbishop of Canterbury," and the admirable statue of "Sir Richard Owen" in the Natural History Museum, South Kensington, both of a high order whether as to character or handling. The bust of "Queen Victoria" is one of the noblest and most dignified works of its class executed in England; full of tenderness and of character, lovingly rendered; and with a delicate feeling for form, rightly realized. This head heralded the noble work by which the memory of Lord Leighton is to be kept green in the aisle of St Paul's Cathedral. In proportion and in harmony of design and of line, alike in conception and in reticence, it is the sculptural expression of a well-ordered mind and taste. The effigy shows Leighton asleep, while figures personifying his arts, painting and sculpture, guard his sarcophagus at head and foot. There is a note of triumph in the great design for the "Queen Victoria Memorial," which is likely to provide London with its most elaborate sculptural effort, rising 70 feet high in a plateau 200 feet across, with numerous emblematical figures of great size and imposing arrangement. In Mr Brock's work the lines are always good. It is based on an elevated style, dignified, refined, and monumental; for he is a sculptor in the full sense of the term.

Thomas Brock, R.A. (1868).

Mr D. W. Stevenson, R.S.A. (b. 1842), in his general work has shown but little sympathy with modern developments. The "Bronze Lectern" (in St Cuthbert's Church, Edinburgh) is perhaps the most decoratively effective; but his most ambitious work, called "The Pompeian Mother," is a modern inspiration of the "Niobe and her Daughter" by a follower of the school of Scopas in the Uffizi Gallery.

D. W. Stevenson, R.S.A. (1868).

Although Mr Horace Montford, modelling-master at the Royal Academy, passed much time in the studio of Matthew Noble (1818–1876), he did not thereby lose his sculptural taste. Not that he displayed it much in the share he had, as assistant to Mr Birch, in the modelling of the notorious "City Griffin" at Temple Bar—a weird but spirited beast, the design for which had been supplied by the City architect, Sir Horace Jones. The statue of "Psyche and the Casket of Venus" may be named as typical of the style of Mr Montford, whose work is usually broad and sculpturesque, and distinguished by firmness and grace.

H. Montford (1870).

Sir Charles B. Lawes (b. 1843) has produced two large works which have attracted attention—the first an elaborate and spirited equestrian group of a female Mazeppa, "They Bound me On" (1888), and the other "The United States of America" (1890), decorative and not without elegance. His work is strong and robust, though somewhat lacking in repose.

Sir C. B. Lawes, Bt. (1870).

Mr W. Hamo Thornycroft (b. 1850; A.R.A. 1881; R.A. 1888), a pupil of his father and at the Royal Academy, had studied in Italy while yet a lad. Believing that the pendulum had overshot the swing from conventional classicality towards pictorial realism, he turned from this "fleshly school," as represented by Carpeaux, towards the Greeks, but he realized the artistic demand and aspirations of modern days. When his prize work, "A Warrior Bearing a Wounded Youth from the Field of Battle," was seen in the Royal Academy Exhibition, it divided attention with Woolner's "Tennyson" and Alfred Stevens's "Wellington." Mr Thornycroft aimed at the cunning contrast of the mature and the youthful naked forms—the tense muscles of the one, and the supine, languorous limbs of the other. "Lot's Wife" (1878) shows none of the prettiness prevailing at the time it was produced, in the rendering of the female form. The fine structure and vigorous modelling of the turned head, the twisted neck with its tense muscles and the strong shoulder, emphasized the pure taste and sense of style of the sculptor. The dramatic action is daring—Lot's wife, with her snatched-up jewels, has turned her head to look, and her lower limbs and drapery are already beginning to take columnar form, as her whole being is struck cold with the sudden transformation. Then came "Artemis" (1879), a surprise to those who imagined that they had taken their measure of the sculptor's exceptional power. The attitude and arrangement are original. From every point of view the group is beautiful; the forms and the head are nobly conceived; and the dog is a good piece of animal life, freely, though statuesquely, treated. Two years later Mr Thornycroft reached the high-water mark of his career with "Teucer." The Homeric bowman, mortified, and eager to redeem his eightfold failure to hit his man, has let fly one shaft more at Hector—and, retaining his attitude, tense and strained, he watches his last arrow in its flight. This figure, simple and severe, is realistic yet classic, instinct with life, and noble in form. It is now in the Chantrey Collection at the Tate Gallery. The great exterior frieze for Mr John Belcher's fine building for the Institute of Chartered Accountants was an important revival of the attempt to set the example of using sculpture by sculptors, instead of by masons, for the worthy embellishment of public buildings—an example that promised to be widely followed.

Hamo Thornycroft, R.A. (1871).

Turning to the ideal, in works entirely modern in motive and treatment, Mr Thornycroft produced "The Sower," a semi-realistic statue in which he sought to combat the difficulty of dress in the British peasant or farm labourer. The head, inclined to be classic, is not unsuited to the labourer; and what the sculptor loses in form, by reason of the design, he gains in action and in movement. "The Mower"—the British equivalent to Constantin Meunier's Flemish or Walloon labourer or workman—is strong and natural in pose, incisive in character, although but a type, masterly in modelling and in restrained suggestion of textures. The "Dean Stanley Memorial," erected in the old church at Holyhead, seems purposely to depart from the severity of line and solemnity of treatment usual in such works. The memorial of the "Bishop of Carlisle" is at once more grave and more fanciful. This leads to Mr Thornycroft's portrait-statues—the ideal and the real. An admirable example of the real, the "General Charles Gordon" in Trafalgar Square, is suggestive of the masterfulness, dignity, and quiet self-confidence of the hero, and is one of the best portrait-statues in England. Prominent among the ideal statues is the colossal "Oliver Cromwell" at Westminster—heavily handled in order to fit the character of the subject, and stolid in dignity and latent energy. The memorial to "Dean Colet," quaintly recalling Donatello or Verrocchio, appeared in its completed form in the Royal Academy of 1901; it is an illustration of the dignity, ease, and simplicity in Mr Thornycroft's more ideal work, for it has in it much of the feeling of the Italian school at its best period, by reason of the quietness, quaintness, and charm in its unostentatious arrangement. In Mr Thornycroft, then, we have to appreciate an unaffected sympathy with grandeur and style, and in all, a big, broad rendering of the human form, with something of the movement of the Greek sculptors and not a little of their repose, yet individual and unmistakably belonging to the British order of mind.

From the year 1873, Mr Roscoe Mullins produced numerous busts and statues, and his work was in the main ideal and decorative. His best figure is probably that of "Cain—My Punishment is Greater than I can Bear," executed in 1896. In architectural embellishment Mr Mullins's work is good in style, appropriate, and effective.

E. R. Mullins (1873).

Mr Swynnerton is a sculptor who has spent a good deal of his time in Rome and worked under her influence. His colossal fountain of flowers, zephyrs, and splashing nymphs is, on the contrary, rather rococo in style, with charming passages. On the other hand, "Love's Chalice" is classic in feeling. Generally speaking, Mr Swynnerton's work has an appearance of strength, without commonness or lack of effect.

J. Swynnerton (1873).

Onslow Ford (1852–1901; A.R.A. 1888; R.A. 1895)—who was lost to British art before he had passed middle age—became known by winning the competition for the statue of "Rowland Hill," now erected outside the Royal Exchange, London; but he made his first real success with his seated life-sized figure in marble of "Henry Irving as Hamlet," now in the Guildhall. It is a well-conceived piece of realism, with expression subtly marked, and verging upon the theatrical—which is precisely what an actor's character-portrait should be. Compared with this work, a later seated statue, that of "Huxley," keen and refined, is more strictly sculpturesque—for in it there is no "subject," and there are no ornaments to divert the attention and suggest a false appearance of decoration. The well-known statue of "Gordon," camel-mounted—reminding us of the "Arab Chief" by Barye—is more open to criticism on the score of the elaborateness of the ornamental details, which almost reach the boundary of what is allowable in sculpture. It is erected at Chatham and a replica has been set up (1902) in Khartum. A finer memorial is that to the honour of "Shelley"—better in its parts than in its entirety,

E. Onslow Ford, R.A. (1875).

because the decorative scheme injures, rather than helps, the sculptural dignity of the drowned poet's exquisitely-rendered figure. This monument is at University College, Oxford; but the replica of the figure, with a plain base, erected on the shore at Viareggio, where the body of Shelley was found, is perhaps finer, because a simpler and more perfectly proportioned work. Of Onslow Ford's other memorials, that of "Queen Victoria" at Manchester is perhaps the most discussed. Although it does not rank by any means with the best of which the artist was capable, the conception is dignified and characteristic. As a truthful portraitist Onslow Ford had few rivals. The busts of "Sir John Millais" as president of the Royal Academy, and of other distinguished artists, of "Sir Frederick Bramwell," "Herbert Spencer," "Queen Victoria," "A. J. Balfour," and very many others, show his talent for producing speaking likenesses. The sitter is before the spectator, without undue flattery, yet without ever showing the commoner side of the model. Flesh, bone, hair, clothing, are all in their true relation, and the whole is admirably realized. Idealism, or at least poetic realism, Onslow Ford cultivated in a considerable series of small works. "Folly," "Echo," "Peace," were varied by the severer "Egyptian Singer" and "Applause." His last figure, "Glory to the Dead," though statuesque, carries realism rather far in treatment. It might be objected that in funerary art, so to call it, the nude was never resorted to by the Greeks in such a relation; but Onslow Ford felt that he was working, not for ancient Greeks, but for modern Englishmen, and that sentiment, and not archæology, must in such matters be the guide. Among Onslow Ford's chief works not yet mentioned are the seated statues of "Dr Dale" and the "Duke of Norfolk." The chief of the standing statues is perhaps the "W. E. Gladstone" at the City Liberal Club, London; the principal equestrian statue, the "Lord Strathnairn," Knightsbridge, London; and the most ambitious monument, that to the "Maharaja of Durbarjah." There are, besides, the "Marlowe Memorial," set up in Canterbury, and the "Jowett Memorial," a wall decoration, in the style of the Italian Renaissance. The work of Onslow Ford always charms, for he had a strong sense of the picturesque and a true feeling for beauty. But for his delight in decorative detail, he would have been greater than he was; for over-enrichment is in inevitable opposition to the greater qualities of the monumental and the dignified in glyptic art, and abundance of small details involves poorness of effect. But against Ford's taste, especially against his admirable dexterity, little need be said. The high degree of refinement, the charm of modelling, grace of line and composition, sweetness of feeling, which are the note of his work, are in a great measure a set-off against occasional weakness of design and character.

H. R. H. Pinker (1875).

Mr Hope Pinker is primarily a portrait-sculptor. Among all his works the seated statue of "Dr Martineau" is perhaps the best, for interest, refinement, and for technical qualities. His reliefs are as numerous as his statues, of which the most popular is the "Henry Fawcett" in the Market Place of Salisbury, but his most important work is the colossal statue of Queen Victoria executed for the Government of British Guiana.

Lord R. Gower (1876).

The most remarkable work executed by any British amateur-sculptor is the "Shakespeare Memorial," presented to the nation by Lord Ronald Gower, and set up by him outside the Shakespeare Theatre at Stratford-on-Avon. This monument, carried out in Paris, represents the poet on the summit, attended below by the four great characters—"Hamlet," "Henry V.," "Lady Macbeth," and "Falstaff," designed with singular ability. Lord Ronald has also modelled statues of "Marie Antoinette," "The Dying Guardsman," and other works which have secured wide attention.

Lord Leighton, P.R.A. (1877).

In 1877 there burst upon the world a new sculptor, in the person of Sir Frederick (afterwards Lord) Leighton (*q.v.*), who, in the following year, was to be the president of the Royal Academy. His first work was "An Athlete Struggling with the Python," to which a brief allusion was made in the 9th edition (vol. xxi. p. 561). No piece of sculpture of modern times made a greater stir on its appearance; for here was a work by a painter, a work, it was declared, which would have done honour to the ancients, fine in style, noble in type and in form, learned in the knowledge of the figure it displayed, original and strong in pose, in action, and movement; scholarly in execution and instinct, with the manner of the painter himself. The group was hailed as a masterpiece by one who was thought to be not yet even a student in sculpture. Yet it is somewhat lacking in expression—in that kind of humanity which every really great masterpiece of art should exhibit; and connoisseurs applauded the technique, the surface qualities, and the like, when they should have been caught by the sentiment. But as Leighton was seeking only the beauty and expression of form, to the neglect of sentiment, he was well content with the reception and world-wide recognition of his work. One day the model for the "Athlete," tired out, rose and stretched himself, and the sculptor was so enraptured by the pose that he forthwith began the model for "The Sluggard." This work is in its way of still higher accomplishment than the "Athlete." It is just as Greek in its devotion to form and its worship of the beauty of the human frame. But it is a condition, a sensation, an idea, rather than an action, that is here recorded; and so it is the higher conception. And it has some of the mystery which is distinctive of the finest art of ancient times, but in which modern sculpture is almost entirely deficient. Yet while the "Athlete" may be compared, in idea, with the relatively debased "Laocoon," which it seems in some degree to follow if not to challenge, the "Sluggard" belongs to a more elevated expression of a distinctly pagan art, and, as it were, to a better period. Great as was the sensation made by these works, and by the charming statue of "Needless Alarms" (cast by the "waste-wax" process), Leighton seems to have left no direct follower or imitator among the younger men.

T. S. Lee (1878).

Mr Stirling Lee, by natural ability as well as by cultivation, is an artist of unusual elevation of mind and excellence of execution, and in his composition he aims at securing beauty by the arrangement of his figures in the panel, rather than at enriching them with details, as a designer would do. He is an ascetic in choice of materials, so that his works generally remain beautiful studies of the human form, draped or undraped. It is for his power of telling a story beautifully in marble—as in his panels for St George's Hall, Liverpool, which are among the finest work of their kind in England—that Mr Lee will continue to be admired: he is, beyond almost all others, a sculptor's sculptor.

J. M. Swan, A.R.A. (1878).

Mr John M. Swan, (b. 1847; A.R.A. 1897; A.R.W.S. 1896), a pupil of the Royal Academy and of M. Gérôme and Frémiet, has specialized as a sculptor of a particular class of subject. He is a stylist in a high degree, whose work is full of beauty and importance. For the most part his sculptures are studies of animals, mainly of the *felidæ*; but Mr Swan passes from the accentuation of action to the covering of skin and hair, without seeking much to emphasize the bone and flesh, because they alone display, with the

fascinating expressiveness of their sinuous bodies, the whole range of the passions in the most concentrated form. In the "Leopard Playing with a Tortoise," "Leopard Running," "Puma and Macaw," and similar works, we have the note of his art—sinuosity, with tense muscles, stretched and folded skin, suppressed frenzy of enjoyment. The note of Barye, the great Frenchman, from whom in some measure Mr Swan drew inspiration, is power and strength and decorative form, but Mr Swan aims rather at fine, grim, naturalistic studies of a great cat's crawl, with vivacity and vitality.

H. Dixon (1881).

Another student of animal life is Mr Harry Dixon, whose bronze "Wild Boar" is in the Tate Gallery. "A Bear Running," excellent alike in character, form, and construction, and especially in movement, "Otters and Salmon," and the figure-subject called "The Slain Enemy"—a prehistoric man with a dead wolf—are among his chief works.

A. C. Lucchesi (1881).

Mr Andrea Lucchesi is one of the few who, in spite of all discouragement, has not only persisted in concentrating his attention on ideal work, but has devoted most of it to the rendering of the female form. Prominent among his figures are those called "Destiny," "The Flight of Fancy," "The Mountain of Fame," and "The Myrtle's Altar." Mr Lucchesi's main excellence is in the treatment of nude forms, in which he has succeeded, through agreeable idea and excellent execution, in interesting a public usually indifferent to this branch of sculpture.

A. Gilbert, R.A. (1882).

Mr Alfred Gilbert (b. 1854; A.R.A. 1887; R.A. 1892; professor of sculpture, R.A., 1900) is one of the greatest figures in British sculpture, not only as being a master of his art, but as having preached in his work a great movement, and in less than a decade effected more than any other man for the salvation of the British school and influenced, quite as much as Carpeaux or Dalou, the young sculptors of the country. After acting as assistant to Boehm, he studied at the Beaux Arts under Cavelier, and then worked in Rome. His chief production there was the beautiful group of the "Mother and Child," produced when the classic sculptors of that city were immersed in the spirit of antiquity. This work brings to mind the teaching of the French school, and makes an irresistible personal appeal to the emotion and sympathy of the spectator. Mr Gilbert then produced "Perseus Arming," "Icarus," "The Offering of Hymen," two fine heads of a man and a girl, pure in style and incisive in character—most of which were cast by the *cire perdue*, or "waste-wax," process, which he had learned in Naples. Its introduction into Great Britain had considerable influence on the treatment of bronze sculpture by British artists. In Mr Gilbert's portraiture we have not merely likenesses in the round, but little biographies full of character, with a spiritual and decorative as well as a physical side, and the mental quality displayed with manly sympathy. Flesh and textures are perfectly realized, yet broad, simple, and modest. Many of these qualities are as obvious in his portrait-statues, such as the fine effigy set up to "John Howard" in the market-place of Bedford. The highly original pedestal has done a good deal to direct into a better channel what are apt to be the eccentricities of what is called the "New Art" school. But the monument with which Mr Gilbert's name will ever be associated is the magnificent "Statue of Queen Victoria" erected at Winchester. The queen is shown with extraordinary dignity. Large in its masses, graceful in its lines, the person of the queen enveloped by all the symbolical figures and fanciful ornaments with which the artist has chosen to enrich it, the monument marks the highest level in this class to which any sculptor and metal-worker has reached for generations. The profusion of an ardent and poetic imagination is seen throughout in the arrangement of the figure itself, in the exquisite "Victory" that surmounts the orb, in the stately throne. Invention, originality, and inspiration are manifest in every part, and every detail is worked out with infinite care, and birth is given to a score of dainty conceits, not all of them, perhaps, entirely defensible from the sculptural point of view. In a measure it suggests goldsmithry, to which the genius of Mr Gilbert has so often yielded, as in the exquisite epergne presented to Queen Victoria on her jubilee in 1887, typifying Britannia's realm and sea power in endless poetic and dainty suggestions of beautiful devices. Among Mr Gilbert's memorials are those to "Frank Holl, R.A.," and to "Randolph Caldecott," both in the crypt of St Paul's Cathedral, London; the "Henry Fawcett" memorial in Westminster Abbey, which, with its row of expressive little symbolical figures, has been styled "a little garden of sculpture"; and the finest work of its kind in England, the "Tomb of the Duke of Clarence" in St George's Chapel. Among Mr Gilbert's other works which should be mentioned are "The Kiss of Victory," "The Enchanted Chair," the statue of "Lord Reay" at Bombay, and the "Shaftesbury Fountain," London. Few artists in any age have shown greater genius as at once sculptor and artificer. Mr Gilbert is fond of dealing with a subject which allows his fancy full play. His work is full of colour; it is playful and broad. The smallest details are big in treatment, and every part is carefully thought out and most ingenious in design. His playfulness has caused him at times to be somewhat too florid in manner; but his taste is so just, that he has safely given rein to his fancy where another man would have run riot and come to grief.

R. Stark (1883).

Mr Robert Stark is an animal sculptor who has usually attracted the notice of connoisseurs rather than of the greater public, and his fine bronze statuette of an "Indian Rhinoceros" is to be seen in the Chantrey Collection. Mr Stark has a profound knowledge of animal anatomy; his range is considerable, and he is as easy with a rhinoceros as with a cart-horse or a hunter.

C. Dressler (1883).

Mr Conrad Dressler is best known for his busts of distinguished men, but his statue of "A Girl Tying up her Sandal," and his two large marble panels for St George's Hall, Liverpool, assured him his position. There is a cleverness, a daring, in his marked style, vigour of treatment, and a tendency towards emphasis, especially in his decorative work, much of which is designed for execution in Della Robbia ware.

H. Bates, A.R.A. (1884).

Harry Bates (1850–1899; A.R.A. 1892), at first a carver's assistant, and then a pupil of the Royal Academy Schools and of Dalou and Rodin, made his first impression with the bronze relief of "Socrates Teaching the People in the Agora," which proclaimed a new sculptor gifted with imagination and romantic feeling controlled, as it were, by classicism. In the three bronze panels on the subject of the "Æneid" which he exhibited in 1885, he gave the second of those admirable reliefs by which his name is best known, and will remain best known, to the public, for many years to come. Then followed his great panel, "Homer: A Blind Old Man, and Poor—Sweetest he Sings." In this work, with its balance and dignity, its rhythmical line and fine expression, is to be seen a flexibility which few young Englishmen had shown up to that time. Style and a genuinely modern treatment of classic form which is not weakened by touches of naturalism, were also to be recognized. Nor does the background detract from the main subject—Homer and Humanity in front; and behind,

a vision of the Parthenon and Pallas Athene, and the great Sun of Art rising with the dawn of Poetry. "Psyche" (1887) is more delicate in thought and treatment, but it has little of the originality or force of the "Homer," or of the classic style in the head called "Rhodope." The serene and reposeful statue of "Pandora," about to open her ivory casket, successfully achieves the purity of style at which the sculptor aimed. "Hounds in Leash" is a vigorous group which was undertaken by Bates in response to the criticism that he could design no figures but such as are at rest. It is in the Tate Gallery, where it figures along with the "Pandora." In "Endymion" the sculptor seems to have united in some degree the sculptural ideas expressed in the "Homer" and the central relief of "Psyche": there is in it a good deal of the grace of the one and of the decorative force of the other, together with a lofty sense of beauty. The portrait-busts of Harry Bates are good pieces of realism—strong, yet delicate in technique, and excellent in character. His statues have a picturesqueness in which the refinement of the sculptor is always felt. Among the chief of these is the fanciful "Maharaja of Mysore," somewhat overladen with ornament, and the equestrian statue of Lord Roberts upon its important pedestal, girdled with a frieze of figures, now set up in Calcutta.

G. J. Frampton, A.R.A. (1884).

Mr George Frampton (b. 1860; A.R.A. 1894; R.A. 1902), pupil of the Royal Academy, the Lambeth Schools, and Merció in Paris, is a particularly versatile and original artist, thoroughly in the "new movement" which he has done so much to direct. Highly accomplished, he is at home in every branch of his art, and covers the whole field. He first exhibited "Socrates Teaching" (1884), and followed this with "The Songster" (1887), "An Act of Mercy" (1888), "In Silence Prayeth She," "The Angel of Death" (1889), "Caprice" (1891), and in 1892 "The Children of the Wolf"—his last ideal statue of the kind. It was followed by "Mysteriarch," heralding a class of work with which the artist has since identified himself; for being in open rebellion against "white sculpture," he thenceforward devoted himself to colour. "Mother and Child" is an experiment in polychromatic figure-work. The half-length figure called "Lamia," with ivory face, head, and neck, and in a quaint head-and-neck dress of bronze jewelled, is a further departure from the true reserve of sculpture, but beautiful and delightful in feeling. The statue of "Dame Alice Owen," in bronze and marble, and "King Edward VI." are original, notwithstanding the pseudo-mediæval taste of their conception. Mr Frampton is happiest in distinctly decorative sculpture. His prolific and inventive fancy has expressed itself in such works as the bronze "The Steamship" and "The Sailing Ship" for Lloyd's Registry in London, and in the memorial "Monument to Charles Mitchell," at Newcastle-on-Tyne. Herein a new note is sounded, and we have some of the most striking features of Mr Frampton's design. That is to say, he seeks to escape from the purely architectural forms, pediments, and mouldings, introducing his own inventions of curved lines, and frequently substituting tree-forms for columns or pilasters, with roots for bases, trunks for pillars, and branches and foliage for capitals. Besides these should be mentioned "The Vision," the seven heroines from the *Morte d'Arthur*, "My Thoughts are my Children," "Music," and "Dancing," and memorials and busts of "Charles Keene," "R. Stuart Poole," "Leigh Hunt," "Passmore Edwards," "Dr Garnett," and a colossal statue of "Queen Victoria" erected in Calcutta. There are always charm of arrangement, delicacy of workmanship, and daintiness of feeling, as well as considerable power of design, simplicity, and breadth in his work.

W. S. Frith (1884).

Mr W. S. Frith, one of the most successful teachers of sculptors in England, is chiefly remarkable for the decorative quality of his work. As in the monument to "Wheatstone, Inventor of the Telegraph," or again, the standard lamps at the Astor Estate Office on the Thames Embankment, the sculptor shows charm of thought and spirit of design, vigour, and richness of effect. His ideal statuary and portraiture are not his chief work, however; his decorative sculpture for ecclesiastical and secular buildings is vast in extent and has had good influence on the younger school.

H. A. Pegram (1884).

Mr Henry Pegram, pupil of Mr Hamo Thornycroft and at the Royal Academy, attracted early attention with "Death Liberating a Prisoner," and by the two high reliefs "Ignis Fatuus" (acquired for the Chantrey Collection) and "The Doom of Medusa." These were followed by "Eve," "Sibylla Fatidica," "The Last Song," "The Bather," "Labour," and "Fortune," by decorative work for the exterior of the Imperial Institute, and later by the great candelabra which flank the interior western end of St Paul's Cathedral. His portraiture is also noteworthy, and his work generally is "big" in style and sculpturesque, with movement and life.

A. G. Walker (1884).

Mr A. G. Walker has produced notable work in the class of pure sculpture, including the relief representing "The Last Plague: The Death of the Firstborn," "Adam and Eve: And They were Afraid," and "The Thorn," graceful and quaintly charming, with elegance in the pose and in the action. His chief decorative work includes the sculptural figures in Stamford Hill Church.

A. Jones (1884).

The name of Mr Adrian Jones is chiefly associated with the spirited work called "Duncan's Horses," a group displaying great knowledge of equine anatomy, form, and action.

W. Reynolds-Stephens (1885).

Mr Reynolds-Stephens, latterly more devoted to goldsmith's figure-work than to larger and more searching sculpture, must be considered less as a statuary than as "a poet who sings in metal." A relief, after Sir L. Alma-Tadema's "Women of Amphessa" (1889), was followed by a "Wall Fountain," "Truth and Justice," and the "Sleeping Beauty," a bas-relief, full of thought, invention, and dainty conceits. In the highly decorated "Launcelot and the Nestling," "Guinevere and the Nestling," and similar works, the artist makes use of various coloured metals, ivory, gems, and the like, with pretty symbolism. Apart from his choice of material, there is a delicate languor about the lines of his figures and reliefs, which display a charming feeling and refined taste.

A. Drury, A.R.A. (1885).

Mr Alfred Drury (b. 1857; A.R.A. 1900) is a pupil specially of Dalou, whose assistant he became. The first result was the curious echo of the master's style, "The Triumph of Silenus" (1885). "The Genius of Sculpture" and "The First Reflection" (bought by the Queen of Saxony), and "The Evening Prayer" (1890, Manchester Corporation Gallery), were followed by the statue of "Circe" (1893), which, through its grace, elegance of line, and symbolical realization of the subject, achieved a great popular success and was acquired by Leeds. The bronze head of "St Agnes" (1894) is one of the first examples of Mr Drury's later style, belonging to the higher order of conception which, generally speaking, he has since maintained. This may be seen in "Griselda" (bought for the Chantrey Collection), "The Age of Innocence," and other stories of childhood, and in the scenes of "The Months," at Barrow Court. For the decoration of the City Square at Leeds Mr Drury executed the statue of Dr Priestly, consisting of the

colossal figure entitled "Even." Mr Drury's quiet, suave, and contemplative art lends itself well as decorative sculpture to architectural embellishment. His portraiture is also good, reticent, and full of character, and as a manipulator of clay he represents the highest contemporary standard of English sculptors.

F. W. Pomeroy (1885). Mr Frederick W. Pomeroy (pupil at the Lambeth and Royal Academy Schools, and of Mercié) is of equal taste and ability. After 1888, when he exhibited the bronze statuette "Giotto," he produced many ideal works—"Love the Conqueror" (Walker Art Gallery, Liverpool), "Pleasures are like Poppies Spread," "Boy Piping," "Dionysos" and "The Nymph of Loch Awe" (both in the Tate Gallery), "A Nymph Finding the Head of Orpheus," "Undine," "Pensée," and the clever study of the nude called "The Potter." "Perseus" is an inspiration from Benvenuto Cellini, but "The Spearman" is an original and powerful work. In ideal statuary he has produced "Admiral Blake," "Dean Hook" (a colossal work for Leeds), "Oliver Cromwell" (also colossal, for St Ives, Huntingdonshire), and "Robert Burns" for Paisley. In true portraiture, Mr Pomeroy executed the Liberal Memorial Statue of Mr Gladstone, in the lobby of the Houses of Parliament, and the recumbent effigy of the Duke of Westminster, for Chester Cathedral. His work is strong and sculpturesque, and his statues "stand" well. He sees nature in a big broad way, and his decoration is effective and well designed.

A. Toft (1885). Mr Albert Toft became known by his statue of "Lilith" (1889), and emphasized the impression then created by "Fate-Led" (1892, Walker Art Gallery), "Age and the Angel of Death," "In the Sere and Yellow Leaf" (a remarkable study of old age), "The Goblet of Life," and "Hagar." "The Spirit of Contemplation" and "The Cup of Immortality" are more complete and display dignity and refinement. Mr Toft's busts, such as those of W. E. Gladstone and Philip Bailey, have force and breadth of character; and in his ideal work there is an effort, well sustained and successful, after dignity, harmony, evenness of balance, and relation of the whole.

E. Lantéri (1885). Professor Édouard Lantéri, a naturalized Englishman, to whom British sculpture owes much, employed his own striking gifts to teach rather than to produce. But "The Fencing Master," "The Duet," and "A Garden Decoration" have exercised influence on the younger school through their fine sculptural qualities of vitality, richness, joyousness, sensuousness, and movement.

W. Birnie Rhind, R.S.A. (1885). Mr Birnie Rhind, R.S.A., has produced little work so important as the elaborate decorations for the doorway of the Scottish National Portrait Gallery, but some of his statues and busts—"King James V. of Scotland," "Lord Salisbury," and others—show the influence of the modern school.

Goscombe John, A.R.A. (1886). Mr Goscombe John (A.R.A. 1899) achieved an early reputation with a figure of "St John the Baptist," an austere creation of real importance. His other chief works are "Morpheus," "A Girl Binding her Hair," "A Boy at Play" (Tate Gallery), "The Glamour of the Rose," and "The Elf"—a weird creation of true comedy. In these are shown a love of the purity and refinement of nature, realized with delicacy and a feeling for beauty. In portraiture Mr John is not less successful. The colossal seated statue of "The Duke of Devonshire" has been acknowledged by the best critics in France and England to be one of the finest things of its kind, good in design and quiet suggestion of power.

B. Mackennal (1886). Mr Bertram Mackennal, the son of a Scottish sculptor settled in Australia, acknowledges no school, but he has been chiefly influenced by study in Paris. In his ideal works, such as "Circe," "For She Sitteth on a Seat in the High Places of the City," there are boldness and sense of drama, with a keen appreciation of elegance of form, not without severity, and power of design. His sculpture is marked by good style, with movement and nervousness of treatment.

H. Hampton (1886). Mr. Herbert Hampton made his first appearance in the Paris Salon with "The Mother of Evil," and then the statues of "David" and "Apollo," and "The Broken Vow," "A Mother and Child," "Narcissus," and other works were seen in the London galleries. Portraiture of merit has come from Mr. Hampton, but his greatest success, perhaps, has been achieved in decorative sculpture.

F. E. Schenck (1886). Mr F. E. Schenck is similarly and more emphatically an architect's sculptor—one of those who have done so much to embellish rightly the numerous great buildings which during the last twenty years of the 19th century were springing up all over Great Britain. The Municipal Buildings at Stafford and Oxford, the Public Library at Shoreditch, and the *Scotsman* Offices in Edinburgh—involving groups of colossal figures bearing close relation to their architectural setting—are among the works which have made his reputation.

J. W. Robbins (1887). Mr J. Wenlock Robbins is another architectual sculptor of real power and individuality, whose work for the New General Hospital in Birmingham and for the Town Hall of Croydon is of a high order. His portraiture is also good, the colossal statue of "Queen Victoria" for Belfast being the most important of his achievements. Of ideal work, the statue called "Nydia" is the best known.

H. C. Fehr (1887). Mr Henry C. Fehr (pupil at the Royal Academy and of Mr Brock) contributed the group of "Perseus and Andromeda" to the Academy in 1893, when it was purchased for the Chantrey Collection (Tate Gallery). His subsequent ideal works, "Hypnos Bestowing Sleep upon the Earth," "The Spirit of the Waves," "St George and the Rescued Maiden," and "Ambition's Crown Fraught with Pain," confirmed the high opinion of his cleverness; but in some of them his exuberance tells somewhat against their general effect, in spite of their inherent grace and strength. On the other hand, the statue of "James Watt" for the City Square of Leeds exhibits those qualities needful for open-air portraiture; and his busts and statues have character and life.

G. E. Wade (1887). Mr. George Wade is essentially a sculptor of busts and statues; the most noteworthy of his works are the memorial to Sir John Macdonald in Montreal, and the seated figure for Madras of the native judge, Sir T. Aiyar Muthuswamy.

G. Bayes (1888). Mr Gilbert Bayes, at first a modeller in the flat of horses treated in a decorative manner, produced "Vanity," "A Knight-Errant," and similar picturesque *bibelôts* on a large scale; and later still, such work as "The Fountain," showing a talent at once more serious, ordered, and graceful.

W. R. Colton (1889). Mr W. R. Colton is a sculptor of strong individuality, capable equally of deep feeling and dainty fancy. "The Girdle," "The Image-Finder," "The Crown of Love," "The Wavelet," and the "The Springtide of Life" reveal a sculptor of exceptional ability, whose love of truth and life sometimes inspires him to place a touch of rather awkward realism in a graceful and charming composition; the result is something unusual, yet quite natural and not objectionable. Mr Colton's

true power of design and sense of style made him a force in the younger school of sculptors.

D. McGill (1889). Mr David McGill, an artist of the same class, first attracted attention with the relief of "Hero and Leander," following it with a series of figures, of which the most striking is "The Bather," a work at once of vigour and of humour. His work is good in pose and line, refined in drawing and feeling, and excellent in style.

C. J. Allen (1890). Mr Charles J. Allen belongs to the same group. "Love and the Mermaid" (Walker Art Gallery, Liverpool), "A Dream of Love," and "Rescued" are works of high merit, in every case good in treatment, free in modelling, and pleasing in design.

F. M. Taubman (1890). There are others who have to be recognized as important, if young, members of the school. Mr Taubman, who has had both French and Belgian teaching, has produced a series of works which display his power of design and strength of technique. "The Angel of Sad Flowers," "Orpheus and Eurydice," and "Adam and Eve" reveal his strength in ideal work; and his statue of "Sir Sidney Waterlow" at Highgate is a good example of his monumental portraiture.

J. P. Macgillvray, R.S.A. (1891). Mr Pittendrigh Macgillvray, R.S.A., belongs to the rather meagre Scottish group. His chief work consists mainly of monuments and colossal memorials. The "Peter Low" memorial in Glasgow Cathedral, the "Robert Burns," the "Allan Family Memorial," the fine relief of "Rhythm," and the "National Gladstone Memorial" for Scotland are his leading works.

Mr Paul Montford, Mr Oliver Wheatley, Mr John Tweed, Mr Hodge, Mr Poole, and Mr Derwent Wood are artists whose work is marked by strong individuality and elevated character, and may be considered leaders among those who are the hope of the future.

Women-sculptors. Women-sculptors (among whom may be included clever amateurs, such as Princess Louise, Duchess of Argyll, and Countess Gleichen) have attracted well-deserved attention in a measure unprecedented in England. Miss Margaret Giles, whose group "After 1900 Years, and still they Crucify" shows power and ability, Miss Ruby Levick, Miss Ellen Rope, Miss Williams, and others, have shown their capacity alike in poetic conception, sound modelling, and decorative design.

Sculptor-decorators. In the section of sculptor-decorators are such workers as Mr Lynn Jenkins, whose frieze in bronze, ivory, and mother-of-pearl at Lloyd's Registry is a remarkable achievement, and Mr Walter Crane, who designed for Manchester a mace that is remarkable for beauty of conception and felicity of symbolism. But other sculptors already mentioned, including Mr Thornycroft, Mr Gilbert, Mr Frampton, Mr Pomeroy, Mr Colton, and Mr Toft, have all devoted themselves to sculptural decoration pure and simple, whether in metal, stone, or marble.

Painter-sculptors. The painter-sculptors command extraordinary respect, for they may claim among them Alfred Stevens, Lord Leighton, Mr J. M. Swan, Mr Reynolds-Stephens, George Richmond, and Mr G. F. Watts. Richmond's real talent may be gauged by his "Monument to Bishop Blomfield" in St Paul's Cathedral. But none surpasses the greatest living English painter (1902), Mr George F. Watts (*q.v.*). He had educated himself artistically on the Elgin Marbles, and he has produced half a dozen pieces of sculpture which place him high among the world's finest sculptors of the 19th century. The recumbent effigy of "Bishop Lonsdale" in Lichfield Cathedral was an epoch-marking work, not only in the technical matter of the bold treatment of the drapery, but in largeness and breadth and its noble sense of style, and the "Lord Lothian" in Bickling Church is also very remarkable. The artist then produced the colossal equestrian group of "Hugh Lupus" for the duke of Westminster (Eaton Hall), a composition as imaginative and original as it is grand and sculpturesque. Then followed "Physical Energy," another equestrian group, which, after being about twenty years in progress, was cast in 1902; it was to be erected in duplicate, one copy in South Africa, to the memory of Cecil Rhodes, whose character it may be held to symbolize, and the other to be set up in London by the British Government. In 1902, also, the statue of "Lord Tennyson," destined for Lincoln's Inn, was completed. But the bust of "Clytie" is surpassed in "bigness" and classic purity of style and feeling by nothing ever produced in England: it is a complete and noble thing. There is no sculptor who has come nearer to obtaining the grandeur of form which is so wonderful in the Greek masterpieces. Simple in line, immense in character, full and rich in modelling, Mr Watts's work is instinct with vigour, breadth, and movement. It sets the true standard, and is a constant and a noble warning to sculptors of the younger school not to be led away by the dainty and fanciful, however alluring. ***G. F. Watts, R.A.***

Metal work. Especially it warns them against what has become a feature with a certain section—the devotion to metal-working, enamelling, and the like, and the free introduction of these accessories into serious sculptural work. Irresistible in the hands of a great artist like Mr Alfred Gilbert, such work, at all times attractive, is the goldsmith's and ironsmith's, but not the sculptor's; and if it has coloured the work of some of the younger sculptors of the day, it is not likely to obtain any very wide hold, or to exercise permanent influence for evil. As we have said, since the publication of the 9th edition no great section of the arts has so completely changed its characteristics as the British school of sculpture.

The subject of British sculpture has been curiously neglected, except in newspaper notices and occasional articles in the periodical press, such as "Living English Sculptors," *Century Magazine*, July 1883, by EDMUND GOSSE. The only volume published is the following:—M. H. SPIELMANN. *British Sculpture and Sculptors of To-day.* London, 1901. (M. H. S.)

FRENCH.

After 1870, when a great artistic movement marked the resuscitation of France after the Franco-German war, sculpture especially revived with exceptional vigour, and the last thirty years of the 19th century were a memorable epoch in its history. Not that many new and unexpected men of genius suddenly arose, for most of the artists who then came to the front had already distinguished themselves by equally noble work; but sculpture, like the other arts, benefited by the pause for thought, and by the ripe and manly tone stamped on the national mind by the discipline of events. Intense ardour animated the admirable group of French sculptors: the oldest still found some lofty expression; the men in their prime showed their powers with unwonted force and fire; and the younger generations grew up in rapid succession, a close phalanx of sculptors whose number is still increasing, for if we include only living artists, and those who have taken honours in the Salons, we find a list of seven hundred exhibitors. The first generation of survivors of the war, who led the way in the new period, still boasted of such men as Dumont (1801–84), Cavelier (1814–94), Bonnassieux (1810–92), Jouffroy (1806–82),

Schoenewerck (1820–85), Carrier-Belleuze (1824–87), Aimé Millet (1819–91), and Clésinger (1814–83). These artists, born in the first quarter of the 19th century, were for the most part each the head of a studio, their teaching being carried on till the end of the century. Next to them followed their immediate pupils, already their rivals, and some indeed famous before the new era; such were Guillaume, Dubois, and Frémiet; others, fresh from the Academy at Rome, at once rose to distinction, and all combined to form the remarkable group of artists to which the modern school of French sculpture owes its world-wide fame. At this time Eugène Guillaume was exhibiting his "Roman Marriage," his "Bust of Mgr Darboy," his "Orpheus," and "Andromache," works of learned skill and severe distinction. Paul Dubois executed his "Narcissus," and the "Tomb of General Lamoricière," on which the decorative figures of Charity, Faith, and Military Courage are popular favourites, full of grave and pathetic feeling. Chapu executed his exquisite figure of "Youth" for the tomb of Henri Regnault, and that of "Thought" for the tomb of Daniel Stern, his monuments to Berryer and to Mgr Dupanloup. Barrias' "First Interment" won him the medal of honour in 1878; besides his patriotic group of the "Defence of Paris." Falguière produced a remarkable series of statues, characterized by their life-like power; some dignified or pathetic, as "St Vincent de Paul," "La Rochejacquelein," and "Cardinal Lavigerie"; some full of bold and dashing spirit, as his "Diana," his "Nereids," and "Hunting Nymphs." Mercié gave us "Gloria Victis," "Quand Même," and his monuments, among which that called "Memory" must be mentioned; his pediment for the Tuileries; his "Genius of Art," &c. Delaplanche produced his "Mother's Teaching," "Music," "The Virgin with a Lily," and "Aurora"; and Allar "The Death of Alcestis." To these names must be added those of Degeorge, who, with Chapu, gave so powerful an impetus to the art of the medallist; of Gautherin, Hiolle, Thomas, Crauck, Lafrance, Maniglier, and Moreau-Vauthier—one of the men who, with Gérôme (the painter) and Frémiet, revived the taste for coloured sculpture, a style first attempted long before by Simart; besides many more. These artists created a supremely healthy and vital school of sculpture, dignified and elegant, learned and varied, fresh and charming, and, above all, as single-hearted and as well trained as in any period of history.
